You will readily see by my sketch of your house and home that while I do not send you so far back with your house as I generally advise for home makers in the country, I do not let you live very close to the street. You must have your house where it will be convenient for your greenhouses, your flowers and your garden. The first of these will explain itself. They must be easy of approach, while your hotbeds are not only easy of access but placed adjacent to your barns. I take it that you will keep a horse and a cow as a part of your garden and floral economy. They enter into the fertilization question quite too largely to be omitted. Nor can we overlook the fact that while you are making your money by selling fruit and flowers largely, it will be true domestic economy to raise for your home use nearly everything that you will require.

Around your barn I place your vegetable garden; and do not omit a good large plot of asparagus and pieplant. These, if skilfully raised, constitute a marketable product of high rank. The drainage of the barn, which sets on a rise of land, comes down directly through and into your vegetable garden. You must make use of every ounce of manure, especially of the liquid. A row of apple trees extends the whole of the rear of your lot; while a windbreak of pear trees flanks both ends. Instead of pear trees, if you prefer, you can plant the ordinary sour cherry, or if the climate suits, the sweet cherry. These make admirable windbreaks, besides furnishing a large amount of usable and salable fruit. I am surprised that the old-fashioned way of planting cherry trees all around the homestead lot has gone out of fashion. I think it is because of the black knot, which for a time made cherry growers

a deal of trouble. I take it you understand that no one is going to get either flowers or fruit without trouble. Therefore plant your cherry trees, and if the knot appears, cut it off and burn it. Small fruits fill up one whole corner of your lot—which I suppose to represent about one acre out of five. If you have two acres only give a half acre to small fruits and another half to plums and cherries. The gooseberry is in growing market demand, and you see that it occupies rows between your plums and cherries.

Now you see that I have plotted for you something that may easily come under the head of intensive farming. I have not put all your eggs into one basket. That old lesson needs to be learned over and over again, and especially in the country we find it essential to diversify our employments. You will probably wish to know a little more definitely what I believe can be your income from such a place as I have described. I have presumed that you saved enough of your capital to keep you out of bankruptcy for three or four years. The very first year you will be saved your rent, and you will secure your own eggs and chickens, a small amount of honey, all the vegetables you will use, besides what fruit you will get from trees and bushes bought with your land. This will not be a small item in living expenses, but you will probably have no surplus to send to market—unless it be that you have secured something of an orchard. Your experience for the next year will not vary much from the first. By the third year you will have a small surplus from your flowers, your berries and small fruits and an increasing surplus from your bees and hens. If you are keeping a cow she will at present add quite as much expense as she will furnish in the way of milk and butter supplies. It will be at least four or five years before you will begin to have a small balance of profit. After this your flowers, your bees, your fruits will all be increasing their returns until they make you comfortable and independent. You will meanwhile be living along the line of the Simple Life, which fortunately is becoming popular.

CLINTON, N. Y.

# Iwana

AFTER A RUSSIAN LEGEND

BY LEONARD CHARLES VAN NOPPEN

THE young Iwana came to Court;  
Fair as a rose she was, and bright  
Her starry eyes, as pure her soul  
As lily white.

The young Iwana served at Court  
As maid of honor to the Queen;  
And beautiful it was to see  
Her brow serene.

Alas! one day the lure-eyed King,  
Did hap to glimpse her beauty there;  
And hotly flamed his hand to pluck  
That rose so fair.

"List, fair Iwana!" whispered he,  
"Say that for love thou wilt be mine,  
And a crown of gold, with pearls bedight,  
Shall then be thine."

"A crown of gold, with pearls bedight,  
I may not wear to grieve thy Queen;  
So let thy maid in honor live—  
Her face unseen."

"Rose of the morning," flattered he;  
"Say that to-night thou wilt be mine;  
The noblest palace in the land  
Shall then be thine."

"The noblest palace in the land  
Is not for me, but for thy Queen;  
So let thy maid in honor live—  
Her face unseen."

"Star of the evening," pleaded he;  
"If but one hour thou wilt be mine,  
The half of all my kingdom proud  
Shall then be thine."

"The half of all thy kingdom proud  
Becomes not me, but thy true Queen;  
So let thy maid in honor live—  
Her face unseen."

"What! cold Iwana," thundered he,  
"Dost dare, rash maid, refuse thy King?  
Thee in the river's chilly deep,  
My slaves shall fling."

"Into the river's gloom, O! King,  
Thy slaves may fling me at thy hest;  
Yet in its deep forgetfulness  
Is peace and rest."

"Sewn in the dreadful drowning-shroud  
Soon shalt thou rue this fatal whim,  
Is life with me then worse than Death—  
Dost thou love him?"

"Better the white of the drowning-shroud  
Than the scarlet robe of the laughing sin;  
God's angels know my heart, and sure  
Shall take me in."

They sew her in the drowning-shroud;  
It trembles on the river's rim;  
And now the King would give the sign—  
Alas, for him!

For lo! like a murmur from the moon,  
Two snowy doves with wings of light!  
And toward that dumb and quivering thing  
They flash their flight.

They grieve like a murmuring music down  
And hover above that shroud so gray;  
Two shining doves flew down the sky!  
Three fly away!

And ah! from that black water rise  
Two demon-birds, with red eyes fell;  
Two ravens, plumed with somber night,  
Flare up from hell!

O fearsome croak, and fearful King!  
O sudden swoop and shuddering prey!  
Two ravens fierce flare out of hell;  
Three flap away!

WEST NEW BRIGHTON, S. I.

# Literature

## Books on Italy

THERE are many reasons for more English books on Italy besides the primal one that English readers buy them. For instance, Italy is a book inspiring country, and a country where all book writers linger. Its history, its art, its present people, all tempt in their turn the pen to paper. The result is a biennial crop, for this southern field admits of two reapings. One wonders if the English weary of Italian olives? Is that their reason for exporting to America?

This season the output is creditable tho not noteworthy. At least no poet's thoughts have been thrown in for flowers. The art students and students of history have been at work, faithfully, seriously,

as they were instructed by their master. If they have not succeeded in turning up any new marvels they have the apology that the ground has been worked before.

Colonel Goff<sup>1</sup> presents a heavy book of pictures, an ambitious piece of color reproduction. It portrays to us in no less than seventy-five separate water colors the familiar haunts of Florence and its environs. These serve to call up pleasant memories to all who know the beauties of that city. One might complain that the colors are a little warm, given over to the oranges and yellows, but there is occasionally also coolness and satisfaction, and if there is never any

<sup>1</sup> FLORENCE AND SOME TUSCAN CITIES. *Painted by Colonel R. C. Goff. Described by Clarissa Goff.* Black, London. Macmillan, American agents. \$6.00.

ELENA, QUEEN OF ITALY

From Waddington's "Italian Letters of a Diplomat's Wife." Scribner's.

hint of common grayness, that tells us the fact that after all Florence is much like other cities, one can forgive the fault if it makes a prettier book and it is true to the good old English tradition—namely, that Italy is full of sunshine and of color; as compared with cloudy England so it is.

Two other books, more satisfactory as guides, tho by no means so elaborate in pictures, are *The Tuscan and Venetian Artists*,<sup>2</sup> by Hope Rea, and *The Story of Venice*,<sup>3</sup> by Thomas Okey. Either of these will slip into a hand bag, and for such travelers as those who want more information than the Murray or the Baedeker give, and who have not the time or inclination for thoughts and researches of their own, these books will doubtless serve as well as any, being, as they are, methodical and new, and not biased by originality of imagination.

Janet Ross has a little volume more chatty, entitled *Old Florence and Modern Tuscany*.<sup>4</sup> Its facts, too, are probably the more interesting because they are gleaned by a process of long living and observation, with love and appreciation of the Italian neighbors, in the hills that overlook the city, among the workers of the streets and of the fields. Four chapters are especially welcome, as they describe the life and the condition of the peasants. As for the chapters on the art of old Florence they are similar to any others on such subjects. Such work is better left to the great masters, and tourists will do better to read their Ruskin, their Browning or their Symonds or the older classics. For Florence life George Eliot still has her interest, and nowhere can one find so much of the beauties of the open Tuscan country as in Ouida's dear old romance, "Pascarel."

Professor Deecke's *Italy*<sup>5</sup> is a perfect and ponderous specimen of a large class of reference books that weigh upon the shelves of our libraries. The class is European in type, tho it is often spoken

of as German. It is really nothing more than a compilation of the facts that may be found in condensed form in a half dozen well selected books, say an almanac, a guide book and a geography. Its encyclopedic information is accompanied by comment on a people that the author cannot understand, because of the heaviness of his temperament; because his nationality prejudices him and Italy is different from Germany—unfortunately, in the eyes of the author, tho there are those of us who are of different opinion. Before finishing with this work we cannot resist the fun of a solitary quotation. Professor Deecke is speaking of political institutions when he says: "The honorary posts are looked upon as a kind of milch cow, which must be milked with all one's force when one is at the helm."

With the books on Italy must be included Vernon Lee's *Enchanted Woods*.<sup>6</sup> Altho this volume of *reisebilder* includes many sketches of France, Germany, Spain and other European countries, it is the Italian scenes that are described most sympathetically. But "described" is not the right word to use here. One can get descriptions from a guide book, and this is made up of just what the guide book leaves out, the personal equation, the temperamental interpretation. The author calls it "a ragbag of impressions," but from it she has made, like our farmers' wives, a carpet, the magic carpet which transports us through German fir trees, into the Euganean Hills, to Tuscan churches, up Monte Mucrone and finally leaves us in "Arcadia." The magic carpet is for part of the way a motor car, but this seems to be exciting less literary repugnance than other modern vehicles. These sketches will be read with enjoyment by those who have visited the same places, as well as persons who, like the author, are homesick for places they have never been to.

Those who like to listen to the gossip of courts—and there are more of them who like it than are willing to confess to it—will take delight in Madame Waddington's new volume of letters.<sup>7</sup> She

<sup>2</sup> THE TUSCAN AND VENETIAN ARTISTS. By Hope Rea. New and enlarged edition. J. M. Dent, London. American agents, Dutton, New York. \$1.50.

<sup>3</sup> THE STORY OF VENICE. By Thomas Okey. Illustrated by Nelly Erichsen. J. M. Dent, London. American agents, Macmillan. \$2.00.

<sup>4</sup> OLD FLORENCE AND MODERN ITALY. By Janet Ross. J. M. Dent, London. Dutton, New York. \$1.50.

<sup>5</sup> ITALY. A Popular Account of the Country, Its People and Institutions. By Prof. W. Deecke. New York: The Macmillan Co. \$5.00.

<sup>6</sup> THE ENCHANTED WOODS, AND OTHER ESSAYS ON THE GENIUS OF PLACES. By Vernon Lee. New York: John Lane. \$1.25.

<sup>7</sup> ITALIAN LETTERS OF A DIPLOMAT'S WIFE. By Mary King Waddington. New York: Charles Scribner's Sons. \$2.50.

was in Rome in 1880, just after her husband, M. William Henry Waddington, had resigned as Premier of France under President Grévy, and again last spring, so she tells of King Humbert and Queen Margherita and Leo XIII, as well as of King Victor Emanuel III and Queen Elena and Pius X, besides any number of uncrowned notables. They are just such letters as one would like to get if he had a friend at court, personal, chatty and unaffected. No diplomatic secrets are revealed, no scandals in high life are exposed, no malicious wit is indulged in. But it is reported that "Ouida" considers it a slander to say that she met Madame Waddington at the gate of her Tuscan villa, a favor she shows none of her visitors.

The history of Venice has a double interest for us Americans, on account of its romance and because in some respects there is a marked resemblance between Venice and our modern cities, which are also essentially commercial and are developing similar forms of government and society. Thayer's *Short History*<sup>8</sup> brings out very clearly the steps by which Venice acquired the very efficient government which gave her five hundred years of power, magnificence and internal quiet. Mr. Thayer defends the Council of Ten against the odium which romances and rhetorical allusion have cast upon it by showing that the peculiar position of Venice necessitated such an institution for maintaining a consistent, secret and far-seeing municipal policy:

"No other Government has trusted so loyally to specialists; no other ruling class has taken such endless pains to train experts. If the patricians swayed the State for their own interests, they gave it in return immense prosperity. Nowhere else were taxes so light, and we hear few complaints from either the bourgeoisie or the common people of unequal burdens. We may say of the Venetian oligarchy that as a working system it came nearer to perfection than any other form of government has come."

From this it may be seen that Mr. Thayer does not altogether escape the enthusiastic partisanship to which all writers on Venice are liable, but he has succeeded admirably in his great undertaking of bringing into one small vol-

ume a history extending from the time of Attila to that of Washington. It is unnecessary to add that it is readable and interesting for the author's previous work, "The Dawn of Italian Independence," proved how well he is able to accomplish the miracle of making dry bones live again.

### Three British Novels

THE *Shining Ferry*<sup>1</sup> is one of the best stories of the year. There is a difference between being a novelist and a literary artist. The mere novelist founds his tale upon a phase, an episode, some sensational feature in history or current life, and his purpose is to produce a startling effect according to the prevailing disorder of the popular mind. But the real artist deals with the eternal elements in nature and human nature, and his purpose is to preserve some reality in the passing show of things. It is not too much to say that Quiller-Couch belongs to this class. In this last story he sets down for our remembrance some star-marks in character as old as the oldest man. He interprets those voices which we have heard from the beginning, echoes from a far heaven that call back forever of honor and righteousness. The men and women who pass to and fro over his shining ferry are good and bad, but they hear the voices, and they bear upon their spirits the hall-mark of another world. And while we shall never be delivered from cant about this other world, we really need the idea to complete and give room to our thinking. The man whose thoughts can be bounded by this one is something of a fool. And of late he has been dabbling in a smart kind of rational fiction, from which Quiller-Couch and a few others are beginning to react. We are getting the sky-line of heaven in our novels again. "Peter Benny" and old "Nicky Oro" stand out against it crossing the ferry in every chapter of this book. And they recommend it to all world-tired people who would catch a glimpse of things as they really are—the pagan sweetness of earth and sky, and of men being drawn up-

<sup>8</sup> A SHORT HISTORY OF VENICE. By William Roscoe Thayer. New York: The Macmillan Company. \$1.50.

<sup>1</sup> THE SHINING FERRY. By Quiller-Couch. New York: Charles Scribner's Sons. \$1.50.

ward, rather than downward, by the very order of things.

A contrast to Quiller-Couch is found in Howard Avering Sturgis, the author of *Belchamber*.<sup>2</sup> He belongs to that class of novelists whose eyes are holden and whose mind is apparently condemned to the contemplation of all that is vicious or weak in human nature. According to his own description he has selected "one of the most beautiful places in England" for the scene of his new story, the characters belong to the "best families"—and with this material he has made every conceivable combination of immorality, without discovering a single virtue. Lord Belchamber, the only decent man in the book, is a sickly cad, tortured by his own sensibilities rather than his conscience, and he becomes the victim of everybody's wickedness, including his wife's. If this diabolical ingenuity for dramatizing the disgusting details of social and domestic putrefaction is an evidence of literary genius, Mr. Sturgis has his share. There is nothing hopeful or right in the book. The author expresses his view of the whole business when he wrote:

"The world is like a huge theatrical company in which half the actors and actresses have been cast for the wrong parts."

Miss Tynan's new novel, *Julia*,<sup>3</sup> is a tale of Irish life that might as well have been located in Switzerland as Ireland. To be sure, there is joy and poverty to prove that the country really is Ireland, but the characters belong to that very great nationality of the imagination. They are romantic figments of personality who do not exist anywhere. Yet the book has its charm. Everybody in it gossips about every one else, and no matter how badly that is done, it attracts the average reader. And Protestants at least will be astonished at the naïve coquetry of the Catholic Sisters in the convent. The only remarkable thing about the heroine is her complexion. The reader finds himself admiring that every time he meets her, to the exclusion of any other attraction that she may possess.

<sup>2</sup> BELCHAMBER. By Howard Avering Sturgis. New York: G. P. Putnam's Sons. \$1.50.

<sup>3</sup> JULIA. By Katharine Tynan. Chicago: A. C. McClurg & Co. \$1.50.

## Science and the New Testament on the Future Life

THE unfortunate notoriety given to Dr. William Osler's semi-facetious remarks on the comparative uselessness of old men has had the advantage of calling public attention to his real worth and literary ability, both of which are shown in his Ingersoll Lecture on Immortality, now in print.<sup>1</sup> The brief pages of this lecture are of delightful literary charm and of great interest as indicating the trend of present thought on the subject of the future life. The author declares that practical indifference is the modern attitude of mind, that immortality is a dead issue in the great movements of the world, and that the Children of Light and of the Spirit who preserve to-day the faith that looks through death are but a small minority, yet for his personal confession Dr. Osler quotes the opinion of Cicero, who said he would rather be mistaken with Plato than be in the right with those who deny altogether the life after death: which shows that the Doctor's colleague was right who said to him: "You will say a few pleasant things, and quote the 'Religio Medici,' but there will be nothing certain." Yet so pleasing are these pleasant uncertainties that no one who reads them will not straightway read them again and yet again. Of special interest is the statement, based upon wide observation, that most people die unconscious and unconcerned, uninfluenced by the thought of a future life, and also that the popular belief that anxiety and fear for the future is a common experience of the dying is a delusion.

Mr. Muirhead's Bruce Lectures<sup>2</sup> are not a portrayal of events after death according to the supposed teaching of Jesus, but a study of the apocalyptic ideas current among the Jews in the time of our Lord and their bearing upon the ethical and religious teaching of the gospels. Certain German scholars, Johannes Weiss in particular, have held that the eschatological views of Jesus were fundamental in his thought, and that His

<sup>1</sup> SCIENCE AND IMMORTALITY. By William Osler, M.D., F.R.S. Boston: Houghton, Mifflin & Co. 85 cents.

<sup>2</sup> THE ESCHATOLOGY OF JESUS. By Lewis A. Muirhead, B.D. New York: A. C. Armstrong & Son. \$1.75.

dominant idea was the approaching kingdom, which He conceived entirely in the future. Mr. Muirhead submits this view to careful investigation, in excellent spirit, cautious yet receptive, and his work is one of the most valuable of recent contributions to the understanding of the Synoptic Gospels.

The Cunningham Lectures of Mr. Kennedy<sup>3</sup> are remarkably similar in purpose and principle to the studies of Mr. Muirhead, but instead of the Synoptic Gospels they have for their field the Epistles of Paul. The author is impressed by the "vital bearing of St. Paul's eschatological outlook upon his theology as a whole," and hence his study of the Apostle's conceptions of the last things in their relation to his thought on other subjects. The work is painstaking and scholarly, but is diffusive and fails in sharp, clear characterization.

**The Land of Riddles, Russia of To-day.** By Dr. Hugo Ganz. New York: Harper & Brothers. \$2.00.

The book is an appreciation of the Russian people and a condemnation of their system of government. Seven chapters are devoted to an exposition of the artistic movements of the Empire. And in vivid language he repaints for us the work of Ryepin, Schischkin, Levitan and Aiwassowsky—unknown names to us, but worthy, in the eyes of this critic, to outrank the best of our more Western artists. The description of Doroshenko's "Everywhere is Life" is especially worth reading. The rest of the book is a stringent indictment against "The Camora," or cabal of bureaucrats, who misrule Russia. Dr. Ganz came most in contact with the cultured class and the tone of the numerous conversations he reports is almost hopelessly pessimistic. The note that rings in all these interviews is expressed by a prominent lawyer in this way: "If God helps us and we lose the war, improvement is possible,—God help us and permit us to be beaten." These interviews, which, in the present crisis, are the most interesting part of the book, give us at length the views of a number of prominent professional men, lawyers,

professors and bankers. Dr. Ganz tells us that, having heard only a monotonous condemnation of existing conditions from his liberal informants, he sought out a well-known conservative to get his view of the other side. Here is a fragment of their conversation:

"'I do not wish,' I began, 'to go through Russia in blinders. If your excellency, as a conservative, will have the goodness to refute what I have heard hitherto, and will give me more accurate information, I shall be under great obligation.'

"'What have you heard?' asked the Count.

"'That Russia is starving, while the papers report a surplus in the treasury.'

"'That, unfortunately, is true.'

"'That your thinking people are in despair.'

"'Also true.'

"'That a revival of the Reign of Terror is to be feared.'

"'Equally true.'

"'That all Russia hopes that the war will be lost, because only in that way can the present state of things be brought to an end.'

"'True again.'

"'That the present *régime* passes all bounds of depravity, and can be compared only with the Prætorian rule in the period of the decline of Rome.'

"'That understates the truth.'"

This is the author's picture of honest conservatism in Russia. We are sorry that Dr. Ganz has not given us a view into the minds of the masses. Perhaps there he might have found a note of hopefulness that would have relieved the uniform pessimism that seems to pervade the cultured class.

**The Follies of Science at the Court of Rudolph II, 1576-1612.** By Henry Carrington Bolton. Milwaukee: Pharmaceutical Review Publishing Co.

We have an abundance of professors of chemistry, but Dr. Bolton is almost our only professor of alchemy, the real old alchemy, not your modern transmutation of elements by radium and your patent medicine elixirs of life. In this book he has crowded a lot of curious and out of the way information about certain people of importance in their day, anecdotes of Dr. Dee and his magic stone, Tycho Brahe and his many noses, Miseroni and his ever-burning lamp, all illuminated with mysterious diagrams and occult recipes. Unfortu-

<sup>3</sup> ST. PAUL'S CONCEPTIONS OF THE LAST THINGS. By the Rev. H. A. A. Kennedy, M.A., D.Sc. New York: A. C. Armstrong & Son. \$2.25.

nately the author has used a semi-fictional form, as if the stories of alchemy and astrology were not romantic enough in themselves, and since he gives no references it is impossible to tell the sources or the authenticity of the quotations and incidents. Here, for example, is told the story of About's popular novel, *Le Nez du Notaire*. Is it really as old as the sixteenth century?

**Physiological Economy in Nutrition.** With Special Reference to the Minimal Proteid Requirement of the Healthy Man. An Experimental Study by Russell H. Chittenden, Ph.D., LL.D., Sc.D., Director of the Sheffield Scientific School of Yale University and Professor of Physiological Chemistry. New York: Frederick A. Stokes Co. \$3.00.

For some time there has been a growing impression that at least the inhabitants of cities eat more than is good for them. Not a few even of those who have devoted considerable time to the study of dietetics and their relation to health have suspected that even the standard daily diet suggested by the distinguished Carl Voit, of Munich, and also the results of the observations of Atwater here in America indicated too liberal a daily allowance of food for the general run of human beings. The public expression of this feeling has been the tendency to take up fads of various kinds, such as vegetarianism and more limited forms of food restriction, until there has come to be a confused state of the mind with regard to what is or is not necessary for the sustenance of the physiological equilibrium, which means health and strength. It is this problem of the healthy dietary that Professor Chittenden has studied very carefully in a series of experiments that can be readily understood even by those not familiar with physiological work. His conclusions are extremely interesting. He says it is obvious from our data that it is quite safe to diminish by one-half the amount of albuminous or proteid food ordinarily consumed, and this without any apparent detriment to health and with even gain to the economy. He points out that the lessened consumption of food of this character, meat, eggs and the legumes, actually seems to spare the individual certain gouty and rheumatic tendencies that are

prone to be very bothersome with advancing years. He calls attention, too, to the fact that the ordinary forms of proteid food are as a rule the most costly of dietetic articles, and since this restriction of albuminous food calls for no great increase in the amount of non-nitrogenous food, it is quite apparent that a great saving in the daily expenditure can be accomplished. In these days when the beef trust is making its exactions so severely felt this is a factor by no means to be despised. Professor Chittenden's observations must be confirmed by those of others before they can be definitely accepted as science, but it would seem that he has made an epochal advance in physiological dietetics.

**Great Englishmen of the Sixteenth Century.** By Sidney Lee. New York: Chas. Scribner's Sons. \$1.75

Delightfully written biographies of Sir Thomas More, Sir Philip Sidney, Sir Walter Raleigh, Spencer, Bacon and Shakespeare, prefaced by the best sketch of the intellectual spirit peculiar to the sixteenth century which we remember anywhere to have read. Moreover, the lives recounted are so well brought together and correlated that we readily see them as the author intends—as exemplars of the highest development of the prevailing spirit rather than as individual careers. Mr. Lee's lectures last year before the Lowell Institute, Boston, met with cordial appreciation, and as these form the basis for the present work, it has that claim also to public favor. Last but not least, the essay on Shakespeare is really supplementary to Mr. Lee's famous life, and whoever has read that—and who has not?—ought to read this later expression of his even more mature conclusions, and especially those whereby he quietly, but with convincing effect, knocks out the last props from under the tottering "Baconians."

**Modern Advertising.** By E. E. Calkins and Ralph Holden. New York: D. Appleton & Co. \$1.50.

We have commented editorially upon the great improvement in the beauty and style of advertising in recent years and called attention to the fact that the adver-

tising pages of a magazine are nowadays as interesting and attractive as the literary matter. If any one is curious to know how this comes about he can learn from this book, which gives the practical details of the advertising business in every field. It is as interesting to read as a novel, even to those who have no pecuniary concern with the subject, while to the advertiser or the publisher it will be worth much money. The authors have had wide experience and have themselves introduced many original ideas into the business. The element of chance is being eliminated from advertising and here is shown how it is done; what articles can be profitably advertised and why, what are the relative advantages of bill boards, car placards, catalogs and magazines, what cuts are most suitable and what type should be used, all illustrated by numerous examples.

**From Epicurus to Christ.** By William DeWitt Hyde. New York: The Macmillan Co. \$1.50.

President Hyde here discourses on ethics and philosophy in a familiar and breezy sort of way, commingling Whitman and Stevenson with Plato and Aristotle, and defining the systems of the ancients by the deeds of Chinese Gordon and Cecil Rhodes as well as by copious extracts from the philosophers themselves. Those who will have their philosophy difficult and technical will doubtless be offended by an exposition of Aristotelian ethics in the terms of the diet regulations of a football team, but the new method of writing philosophy in the language of the street certainly has its advantages for some people, and for the pedant are there not already Zeller and Windelband? Paulsen among the Germans is not ashamed to introduce the trials of a tenement house dweller into a discussion of the virtues, and President Hyde is not beyond the limits in referring to incidents of frequent happening in common life in the effort to make clear the chief ethical principles of antiquity, their modern modifications, and their relation to the moral teachings of Christianity.

## Pebbles

**IN PROHIBITION KANSAS.**—Out of respect for Frank Dell, deceased, all of the saloons in the city [Great Bend] closed from 1 to 4 p.m. yesterday.—*Barton County Democrat*.

.... "What kind of a looking man is that chap Gabbleton you just mentioned? I don't believe I have met him." "Well, if you see two men off in a corner anywhere and one of them looks bored to death, the other one is Gabbleton."—*Puck*.

.... Your true poet is never bothered for a rime. Addressing a stanza to his inamorata a young writer was for a moment puzzled about a rime for "nightingale," but got out of it thus:

"My love is a chrysanthemum  
And I am like the nightingale.  
I sing her verses all the night,  
Unmindful of the biting gale."

—*Japan Mail*.

.... **A RIVAL TO THE FISH.**—"Talk about mosquitoes," said an American, "why, when we were in latitude 30 degrees and longitude 75 degrees, a host of mosquitoes settled on our rigging, and when they left us there wasn't a stitch of canvas left on the boat." "Wal," said his friend, "that's strange, because when I was sailing in latitude 29 degrees and longitude 74 degrees, a swarm of mosquitoes settled on our rigging and every one of them had a pair of canvas breeches on. Same mosquitoes, no doubt!"—*The London Globe*.

### THE ORDINARY MAN.

(A Typical, Topical Song.)

I'm not an old-age hater recommending chloroform,

Nor a minister who acts and sports the can,  
No business-seeking modiste advocating more of form—

I'm nothing but an ordinary man.

I never won the Governorship by advertising shoes,

Nor sold my books by being President,  
Nor tried to boom my theater by calling on the Jews—

An ordinary man, I am content.

I'm not a college prexy dropping kicks at football pranks,

Nor begging gifts of dress suits or of cash;  
I'm not a clever Cassie with a hunch for breaking banks

Nor yet a frenzied fabricator rash.

Yet I'm the needed element in all their fads and ads,

To gape and worship as their deeds I scan,  
To buy the well-filled papers and to utter my "egads!"

Yes, they've got to have the ordinary man.

—*Harvard Lampoon*.

# Editorials

## Mob Rule in Chicago

No honest man endowed with common sense should have the least difficulty in ascertaining the true character of the labor insurrection in Chicago, or in seeing what is the only remedy for such disgraceful and shocking exhibitions of anarchy. Throughout last week the city was at the mercy of a mob. In many of the streets there was almost continuous riot. Several men were killed, many were so brutally beaten that their injuries may be fatal, hundreds were disabled by wounds of various kinds. Citizens having not the remotest connection with the controversy were murderously attacked. The pastor of one of the Presbyterian churches nearly lost his life at the hands of ruffians who sought to uphold the cause of the strikers and boycotters by beating any one who seemed to be without protection. In the very heart of the city, at the doors of its finest hotels, men were shot or clubbed almost to death simply because they had accepted work which the attacking ruffians had declined to do. A peaceable old man, delivering a little bundle of goods in his own wagon because there was no one to do it for him, was murdered for thus trying to keep his agreements and earn a living. These were some of the incidents of this insurrection of the teamsters' union.

The causes of this revolt against law and the rules of civilization scarcely deserve to be considered because they are so overshadowed by the lawlessness of which Chicago ought to be ashamed. Four months ago a score of garment workers employed in a clothing house quit work, went on strike, as a protest against the employment of associates who were not members of the union. Their places were soon filled. But their union, after much delay, induced the union teamsters employed by the same house to strike in sympathy with them, altho the teamsters themselves had no grievance whatever. By degrees this strike spread, owing to the boycotting of other employers who had business deal-

ings with the house where the dispute originated, and in time it involved many of the largest shops and manufacturing concerns in the city. "You must assist us in ruining Montgomery, Ward & Co.," said the strikers to these other employers, "or we shall paralyze your business and ruin you." Those to whom this threat was made had had no quarrel with the teamsters' union, but they determined to carry on their business, if possible, without violating the laws and becoming partners in the offenses or crimes that were being committed. Deserted by their teamsters, they have sought to employ other persons to do the work of delivery and distribution upon which their industries depend. The result has been almost continuous riot, in dealing with which both the police and the sheriffs' deputies have made a pitiful exhibition of weakness or something worse.

The principle which should be sustained and enforced in all such cases is plain enough. Workmen have a right to stop work and go on strike; they have no right by violence or intimidation to prevent other men from taking up the work they have declined to do. Of course they have no right to break the laws against assault and murder. If they do attempt by violence to prevent other workmen from taking up the labor which they have rejected, it is the imperative duty of the authorities to protect these other workmen, to arrest and punish their assailants and to preserve order.

In Chicago the authorities appear to have lost sight and knowledge of this principle, these established and fundamental doctrines, so essential to the preservation of liberty and the maintenance of civilization. If the police force was inadequate or untrustworthy, and if such aid as the sheriff could give was insufficient, then the militia should have been used. If these citizen soldiers of Illinois had been unable to suppress insurrection and preserve order, there should have been an official demand for the troops of the United States. The

streets of Chicago should have been made safe for law-abiding persons engaged in legitimate business and honest work by the official use of such force as was needed, from whatever source it might come.

But the new Mayor shut his eyes to the riots and bloodshed and anarchy in the streets, or, seeing it, turned his back upon business men and business associations who urged him to ask for the militia. To make such a request, he said, "would humiliate our city." It was better, in his opinion, that it should be humiliated before the world by the unchecked violence of the mob, by an unrestrained war upon men who were trying to work and earn wages, by murderous assaults upon peaceable citizens and by murder itself, unpunished, in the streets.

We are disappointed in this disclosure of Judge Dunne's weakness. Coming to his present office after many years of excellent service on the bench, and elected as the leader of a popular movement involving municipal problems of great importance, here, at the beginning of his term, he was confronted with this opportunity to prove his quality. He has not only let it pass unimproved, but he has also permitted the manner in which he has rejected it to show how poorly equipped he is for ruling over a city like Chicago. Where was Judge Dunne's veneration for the law, where was his respect for the rules of justice, when he permitted the laws to be broken continuously and with impunity, when he allowed the requirements of common justice to be ignored and despised? How can he hope to inspire confidence in those who have expected that he would establish successfully the rights of the people in their streets, with respect to railway traffic, now that he has failed to defend those rights when only the teamsters and their wagons were concerned? Whom did he permit to own and operate the streets of Chicago last week? The important experiment of municipal ownership and operation of street railways should be made under the direction of a stronger man.

The deplorable and disgraceful conditions in Chicago which appeal to the authorities of that city and of the State of

Illinois for a speedy use of the only remedy that can be effective, should suggest no consideration of questions of unionism, open shop or closed shop. Shall the laws be enforced? Shall life be protected? Shall criminals be pursued and punished? Shall liberty be preserved and the machinery of civilization be saved from wreck? These are the only questions to be answered when such an insurrection takes place. To answer them promptly and forcibly and correctly is proof of good government. To hesitate, to temporize, to ignore or to excuse the injustice and the crime, and even to plead for arbitration, in such a case, is to encourage the forces of disorder and to breed more violence of the same kind hereafter.

### A Presbyterian Cathedral

JUSTICE HARLAN'S proposition that there should be erected in Washington what he would call "the cathedral church of our denomination at the national capital" illustrates his interest both in religion and in the dignity and usefulness of the Presbyterian denomination. He offers, in a circular addressed to leading ministers, to give a good part of his time during the rest of his life (he is 73) to the project of building such a cathedral at Washington.

The scheme implies, or ought to imply, two things: One is an imposing building, to please the eye of the lover of fine architecture, and, of course, a building that would compare favorably with any corresponding structure which the Catholics or Episcopalians might build, so as to show that Presbyterianism can do as well as the best. But of course that is not a chief purpose, nor worth the effort, being chiefly for esthetics and ambitious rivalry. The other end that should be in view is utterly different from what has most created cathedrals; for this should not be a building designed for interior display of gorgeous processional worship, but one for the benefit of the people. It should be the gift of the rich to the needs of the poor, to provide instruction, religious, technical, general; to supply bureaus of assistance and direction; in short, to do good to people who are not Presbyterians, and in large part

not religious at all. And the people who will need it most are a class that flock to Washington, where there is a larger number of them than in any city in the South.

But when we come to consider the work of such a Presbyterian cathedral we are led to ask whether its true work would not for the most part be just what is doing by the Young Men's Christian Association, the charities organizations, public libraries, and the public and technical schools, which are developing everywhere, and are not on denominational lines. It is the glory of modern Christianity that it has so pervaded society that society in these ways does the work of the Church. Society in its care for the community has become itself an unorganized Church, so that we can hardly tell where Church ends and society begins.

There is a fairly broad line now of division between the people who control public opinion, and do these good things, these Christian things, and those other people whose life and business and purpose is corrupting. In the former class is the entire Church, and a good many other people whose sympathies and soul are with it, altho they are not its members. On the other side are the people who frequent the resorts which it is the business of law to suppress, or at least to control. It is now to be considered whether it is not best that these works of charity, hospitals, libraries, schools, employment agencies, etc., should be cared for by this general churchly community rather than by separate and rival denominations.

The suggestion that Justice Harlan will leave the Supreme Bench to undertake this proposed work seems hardly wise. His health is still strong, and his present field of service is of the highest for the public welfare.

### A Southern University

THE South has many so-called universities, but it is peculiarly difficult to establish one there which actually conforms to university standards in the grade and amount of work required for graduation. This is explained by the

fact that there is no educational type in that section. And there is no such type because the Southern temper has always resented discipline and the imposition of arbitrary standards, whether in ethics or education. This is a heroic limitation of character, based partly upon actual ignorance and partly upon a nature gifted more with the achieving spirit than with powers of purely intellectual concentration. The Southerner has a war-crying impatience to be in the thick of the fight whether he is prepared or not. It is therefore nearly impossible to keep him in school a sufficient length of time. And naturally he not only lacks proper preparation for university work but, what is more deplorable, he lacks discrimination, even preferring to attend those institutions where the requirements are less exacting. Thus it happens that while an elevation of the standard in an Eastern university invariably results in an increased attendance, the opposite effect is experienced in the South. On this account entrance examinations are often almost elementary and in some cases dispensed with altogether.

This intellectual somnolence, this indifference to thoroughness in educational training, led shortly after the war to the conviction among thoughtful men of the need of a higher institution of learning in the South which would be sufficiently endowed and sufficiently free from traditions and prejudices to offer modern university advantages to students willing to receive them. And it so happened that the man most able and effective in carrying out the conviction to realization was Bishop McTyeire, of the Southern Methodist Church, who also happened to be related through his wife to the Vanderbilt family. Thus, he secured a gift of a million dollars for the founding of what is known as Vanderbilt University, at Nashville, Tenn. The charter was issued in 1872 and the university was opened to students in 1875. Since that time it has received other donations from members of the Vanderbilt family and has been recognized as a Methodist institution. But, in fact, it is not denominational in the accepted sense of that term. It is not under the control of any Methodist Conference, but of a Board of Trustees which is self-perpetuating.

The majority of its professors are not Methodists, and it represents a sentiment broader than any Church or any section. Dr. J. H. Kirkland, the present Chancellor, stands for a liberal policy and thorough work. He is called the Eliot of Southern educational circles, and no man in the South has labored with more sincerity or less ostentation in a profession that so readily admits charlatan pretensions.

Such, in brief, is the history of Vanderbilt University until April 20th of this year. On that day the oldest and largest of the buildings was burned—valued at \$300,000, with an insurance of \$115,000. But the significance of the loss cannot be measured by these figures. The library, the public auditorium, the chemical and physical laboratories and several recitation rooms were located in this building. Thirty thousand books, including the entire graduate library, were destroyed and five departments of the university rendered homeless.

But before the fire was extinguished a schedule of the next day's recitations had been posted, and that night visitors on the campus saw that every window in the great dormitories was lighted and that preparation for the morrow's work was going on as usual. And those best acquainted with what may be called the ancestry of the Southern temperament regard this circumstance as an indication of the character of the university's influence upon the eight hundred young men within her walls. For, whatever may be said of college men elsewhere, in the South they are disposed as a rule to "celebrate" even their disasters.

It is understood that the greater future of the university will date from this fire. The plan is to replace the burned building with four new ones at a cost of half a million dollars. And, recognizing the fact that the effort to raise this amount should begin at home, the alumni and the citizens of Nashville have already contributed \$70,000. This sum is not insignificant when we consider that all the graduates of the institution are still young men, that the best educated men in the South are almost invariably poor, because the needs of their section have called them to professions which are not remunerative, and that

even the successful business men there are not yet rich. There would be no more objection to Mr. Rockefeller's money than there was in the case of Trinity College in North Carolina, which is endowed with what may be called "Duke's Mixture," a famous cigaret tobacco which made Mr. Duke so rich that he in turn made this college rich. And the young men who graduate from it are as excellent in character as if the endowment had been a "church collection." So if some oil or steel or railroad magnate wishes to give a million dollars to Vanderbilt, no questions will be asked. Later, of course, the citizen graduate may meet him at Philippi. But that is another matter.

### Needed Reform in Criminal Law

It is fortunate that from time to time public attention is directed by sensational incidents to the antiquated and disgraceful state of American criminal law. The average man is not brought by calm reflection to an earnest purpose to do what lies within his power to make the world better. He has to be shaken up by something that grips his imagination and perturbs his feelings.

The three abortive trials of Nan Patterson, charged with having murdered Cæsar Young, and the refusal of the Court of Pardons of New Jersey to commute the sentence of death pronounced upon Mrs. Anna Valentina for the murder of Rosa Salza, have so far aroused popular feeling that we may hope that some real steps may be taken to accomplish two or three reforms imperatively demanded by reason and moral sense. The decision of the Court of Pardons of New Jersey is an example of the brusque, relentless procedure which long since became famous throughout the country as "Jersey justice." The ignominious failure of the District Attorney's office to convict Nan Patterson is one more example of the ineffectiveness of the criminal law machinery of the Empire State, which results annually in the squandering of enormous sums of public money to no useful purpose. The "Jersey justice" and the New York in-

efficiency are equally reprehensible when critically examined in the light of scientific knowledge and sound moral principles.

The New York procedure deserves condemnation primarily because it is the most amazing example now presented by any American commonwealth of the abandonment in practice of that theory of the criminal trial which is an essential part of constitutional government.

In the theory of English and American criminal law an accused person is presumed to be innocent until convicted, by evidence presented, of a specific criminal act. A jury is not authorized to convict, as the old Veme courts of Germany used to convict and as the Vigilance Committee too often convicts, because it is convinced that the accused is a bad character who ought to be hanged anyhow. Furthermore, in legal theory the District Attorney is an officer of the court, whose plain and sworn duty is to enforce the criminal law and who is, therefore, under as much legal and moral obligation to secure the acquittal of an innocent person as to secure the conviction of a guilty one.

In practice, however, nearly every jury in recent years is obviously composed in part of men who accept the legal principle that they may find a verdict only upon evidence that a specific criminal act has or has not been committed and in part of men who hold the Vigilance Committee view, that it is their business to loose or bind according to the apparent moral character of the accused. The men on the Patterson jury who wished to render a verdict of murder in the first degree were clearly of the latter type, because, whatever part Nan Patterson may have had in the death of Cæsar Young, the District Attorney's office failed to prove that the revolver with which Young was shot was ever in Nan Patterson's hands or that she had a motive for killing him. As for the District Attorney's office itself, the conduct of the case by Mr. Rand was not creditable to a professedly civilized community.

The New Jersey case opens a yet deeper practical problem. Beyond doubt a sentiment against capital punishment is growing throughout America and Eu-

rope. We are not convinced that the complete abandonment of the death penalty is at present expedient. But clearly the time has come when the civilized world should take up for earnest consideration the question, long ago raised by Lombroso and the criminal anthropologists generally, whether it is expedient or right to lump together all "murders" and punish all with the same penalty. The criminal anthropologist makes a clean-cut distinction among criminals that commit acts of violence. The instinctive criminal is a dangerous brute, no more to be restrained by economic, moral or social considerations than a mad dog is. The professional criminal deliberately preys upon his fellow men with the cool calculation of a stock jobber or a promoter. The passionate criminal commits deeds of violence in moments of overwrought emotion, when self-control is lost. He, too, is a dangerous person, but not in the same degree as the other two. No such culpability attaches to his acts or to his character as to the character and acts of the professional criminal, and he can be disciplined by methods that are not applicable to the criminal by instinct. Strong arguments can be presented in favor of inflicting the death penalty upon murderers whose records show that they are professional or instinctive criminals. To inflict the death penalty upon the passionate criminal is to perpetuate a survival of barbarism, almost of savagery.

Mrs. Valentina had been deserted by her husband, or the man who lived with her as such, and she killed her rival, Rosa Salza, in a moment of hysterical frenzy. She should be restrained of her liberty for a reasonable time and be subjected to wholesome moral discipline in a correctional institution. Her death by hanging will be an everlasting stain upon the fair name of the commonwealth of New Jersey.

### Crossing the Line

APRIL puts away the sap buckets, pulls out the spiles and places in storage the first harvest of the year. May brings out the plow and turns open the sod for earth-born crops. Nature has things admirably adjusted. Each zone has its

sweets as well as its grains and fruits. The maple orchard is as important as the apple orchard. The Indians, before the whites appeared, had great groves of apples and equally large groves of maples—fifteen hundred trees to a grove—not trees in rows, but in irregular groups. We learned the art of sugar making from the Iroquois.

April is the month of showers, May the month of flowers. Snow showers come down to the hyacinth days. A few of the earlier flowers, such as the anemone, seem to enjoy standing up through a good dressing of snow. These are the border days, and as it is with some tribes of men, there are floral tribes that do not like too much heat. They stand with their coats off, perspiring, with the thermometer at thirty, and they wither when it comes up to fifty. What can possibly tell a hyacinth bulb that the snow banks are melting? They must begin to grow before the frost is out of the ground.

Robins start from the South in March and they get home about the middle of the month. In April they are picking sticks and pulling strings and carrying mud for nests—the cheapest bird-hovels in the bird republic. In May they are fathers and mothers and are ready for the early cherries. Bluebirds, through April, seem to be always cleaving the blue sky—with a coultter of keen song going ahead. No matter how cold it may be, their notes fit strangely fine to the sharp edged wind. In May they are in and out of holes in your trees, carrying worms to the brightest boys and girls in the world. About May 10th comes the catbird—the one bird that becomes a member of your family. He knows you as well as your collie dog, and he never sings without more or less consideration of the fact that you admire him.

March gets rid of most of the snow; April starts the green, lines of that delightful color marking the brook courses. You trace them all over the valley and up and down the bordering hillsides. Your eye finds comfort, as it looks away from the white lines of lingering snow to the green lines of inquisitive grass, in which you find, half hid, the early coltsfoot flowers. The finest thing in the world is a brook, and in April it is the

sauciest, freest, noisiest and the lordliest. It is life broken loose and rejoicing in its strength. It is school let out. Down out of the glens they come, bringing the melted snowbanks, and making music of every obstruction. In May all this frolic is over with; the world has been set in motion, and the water runs as smoothly as a hymn down through the meadows, where the cows come to drink.

There is just one shrub that makes warm the April lawn—yes, there are two—one is the yellow forsythia and the other is the daphne; but May is a continuous procession of floral delights—from the earliest lilac to the latest mock-orange. The Judas tree sometimes manages to have one foot in April and the other in May. All this shrubbery is a marvel. The florescence is so grand, so unlimited, and, what never fails to surprise is that each variety moves along just in time to give place to its successor. Perfumes fill the air and ozone tempts you to breathe big full breaths of life-giving air.

April swells the buds that Nature tucked away last fall. Wrapped in coarse clothing these germs waited all winter for a summons of life. April touches them with warm rays, and they open to grow. This is a delight that never tires. The bees find first soft maples and elms, with crocus and snowdrops in the grass, and gooseberry blossoms in the garden. They gather pollen and make a good ready for the honey flowers that follow. But it is May that gives us that most wonderful sight, an apple orchard in bloom—or is it the plum trees and cherry trees that are finer? The bees will not decide for us, for they are busy all day extracting those sweets, which only come to us in perfume.

April is more nearly the spring month than May. Leaves spring out of the buds and watercourses spring out of the hills. Everything is in preparation and all things are in haste, but everywhere there is joy in work. Nothing repeats itself. In April the world always seems a strange new world to us. May has settled down to system and formularies. Now we begin to live out of doors; our rapid strides tone down to an easy stroll. Nature once more takes us into companionship.

April bonfires are a social proclamation of release from winter. They are beacon lights, which the builders generally kindle at night, as if to say to all the neighbors on distant hills, "See! We are ready for the year! Let us rejoice together!" May draws veils of foliage between neighbors, shuts in each one to himself and bids him do his duty. It is now retirement that each one needs, and accepts. Summer develops individuality. The clubs close their doors, and we find each other studying the problem of culture with birds and bees; for now nobody has time to discuss or gossip.

April we expect to bring instability. It goes from July days to snow squalls. It never knows its mind for two days in succession. How can it, when it has to hark from Labrador icebanks and from West Indian hurricanes? But, after all, it is May that brings us the real anxiety. After the garden stuff is up, and the grapes are set on the vines, and the calyx drops from the plum, alas, what sorrow can come from a single frost! There really is some excuse for Mr. Put-off in early May.

Now let us touch hearts in another year's work. There is something grand about that steady faith that plows and plants, without knowing what a day may bring forth, because "we live in Him," and in Him have our being. The universe surely runs on a benign principle, and the most reasonable thing in the world is to go ahead with faith.

### A Great Teacher

ON Tuesday, May 2d, some four hundred physicians from among the most prominent members of the medical profession in this country gave a banquet of farewell in honor of the man whom all acknowledge as the most distinguished teacher of medicine of the present generation in America. There are not a few of those who are best in a position to judge who would not hesitate to declare Professor Osler of Johns Hopkins, for he was the guest of honor, to whom the banquet was given, as the greatest of living teachers of medicine. Within the last few weeks Professor Osler has obtained an unenviable notoriety because

of the twisting of certain expressions of his from the sense he intended and their frequent repetition by the newspaper press of the country. For those who are in the secret the failure of our newspapers to see the patent joke in the sentences they took so seriously makes some of us feel as tho the characteristic American facility for catching on to anything humorous, for which we are so proud of our countrymen, was fatally eclipsed on this occasion.

There are few members of the medical profession in all the history of medicine who have occupied the position that Professor Osler has succeeded in creating for himself. He is looked up to as an authority in pathology, as one of our best experts in diagnosis, as a thoroughly conservative yet knowing therapist, as a keen observer who but rarely misses even the slightest hints of complications and diseased combinations that are likely to be serious for the patient, and as a prognostician of ability and assurance, yet with all this as a man of wide learning, of broad sympathy with men, of a deep knowledge of human nature, of an extent of reading hard to think of as compatible with his scientific attainments and a faculty for making friends and avoiding the making of enemies in the devious paths of a thorny profession that stamp him as that *rara avis in terris*—an all around genius without any of Quintilian's hint of possible queerness in his disposition.

Professor Osler as a man, indeed, is even more interesting than Professor Osler the physician. In an age when money making is so apt to be considered the standard of success in life he has constantly taught by word and by example that there is a higher meed than pecuniary gain and that satisfaction with life means much more than the accumulation of wealth. He has often quoted the passage from Ecclesiastes, which the preacher of old seems almost to have said with our generation in view: "Better is an handful with quietness than both the hands full with travail and vexation of spirit." At the present moment Osler himself is nobly leading the way in this. He is giving up his position at Johns Hopkins, where he commands a magnificent salary and where he enjoys a

consultation practice worth many thousands a year in addition, to accept the Regius Professorship of Medicine at Oxford, at a salary considerably less than that received at Baltimore and with the chances of consultation practice, for some years at least, rather dubious and uncertain. He is doing this because he feels that in his new position and amid new surroundings he can exert an influence for good in medical education that will make itself felt in a wider sphere and for a longer time than would otherwise be the case. Whatever of good he could accomplish at Johns Hopkins has been done. A tradition has been created that will help his successors to carry on the work so well begun; so he looks farther afield for self-impression on another environment. Is it any wonder he is looked upon as an exceptional man?

He has stood for a breadth of culture among medical men that has been of more service in raising the standard of the profession in this country and in setting high ideals of intellectual development before it than has been accomplished by much of the legal regulation of these last twenty years. He himself is a cultured scholar in the best sense of the word. While his knowledge of medical history and of medical bibliography has made him one of the most interesting of professional talkers and has made his text-book a mine of interest and information, even for those not professionally interested in his subjects, his reading outside of medicine has not only been extensive, but such has been his attention to it that the knowledge gleaned is little less than profound.

While he quotes Scripture with an aptitude that would recall the old-fashioned clergyman, his addresses show him intimately acquainted with Dante and Shakespeare, with Plato and Cicero, with most of the classical poets, Latin and Greek, with Thackeray and George Eliot and Tennyson and Walter Pater and Cardinal Newman. Of modern writers it is to the two last particularly that he goes for quotations aptly illustrative and always carrying with them a great truth supremely expressed. Not a single address of his on educational matters but is illumined by light from the great English Cardinal, who knew so

well the shades of educational questions and who realized how trying was to be their solution to the generation after his own. It was Osler himself who suggested to his medical students that every man could get a liberal education, if not that of a scholar, at least that of a gentleman, by reading for half an hour every night before going to sleep and keeping a book open on his dressing table in the morning. For this, ten books he suggested should be close friends—the Old and New Testaments, Shakespeare, Montaigne, Plutarch's Lives, Marcus Aurelius, Epictetus, Religio Medici, Don Quixote, Emerson and Holmes (the Breakfast Table series).

To Professor Osler in farewell may very well be wished the fruition of what he himself in his address before the University of Minnesota nearly fifteen years ago pointed out as the most important outcome of life's work. He had been telling the medical students of that university the beauty of life lived for an ideal:

"It will give to your youth an exhilarating zeal and a cheerfulness which will enable you to surmount all obstacles; to your maturity a serene judgment of men and things and that broad charity without which all else is naught; to your old age that greatest of blessings, peace of mind—a realization maybe of the prayer of Socrates for the beauty in the inward soul and for the unity of the outer and the inner man; perhaps of the promise of St. Bernard, '*Pax sine crimine, pax sine turbine, pax sine rixa.*'"

Those who know him best appreciate how much this peace is his—the equanimity whose cultivation he so ardently recommends to his students.

Dr. Osler ventured to review his work in words that might be written in letters of gold—they are golden words—under kindred words of Paul the aged:

"I can truly say to you, and I take myself to witness, that in my sojourn among you I have loved no darkness, sophisticated no truth, nursed no delusions and allowed no fear."

Put that among your choicest mottoes. It is splendid rhetoric; it is lofty ethics.

## Free Lecture Courses for Cities

FOR fifteen years New York City has led the world in the movement for adult education. For a decade and a half free lectures, scientific demonstrations and

courses have been given to the people under the auspices of the Board of Education. The school houses have been opened at night and the assembly halls and playgrounds converted into auditoriums for gatherings of men and women—largely working people. It is one of the most interesting and, perhaps, most valuable developments of the university extension movement. During the seventeenth season, which closed early in May, more than 140 school houses, public halls, church lyceums and settlement houses were used as lecture centers. Nearly 4,650 lectures were given to audiences varying in size from a handful to two thousand, but aggregating 1,155,000 people.

Dr. Henry M. Leipziger, the supervisor of this vast lecture system, has devoted himself untiringly and unsparingly to the development of the work almost from its conception. Years back he recognized the ruthless waste of using the public school buildings but a few hours in the day time. With the zeal and determination of a prophet he set about opening their doors at night that the whole people might come in and receive the best fruits of scholarship and travel. Trained lecturers, university professors, men and women familiar with other lands were brought into this municipal free lecture system to give to the people of New York City the most and the best that can be brought through the mediumship of the platform—not alone to those who live in the heart of the city, but to everybody, even to those living in sections of Greater New York most remote from Manhattan. There is a lecture center, for example, at Barren Island, a spot in the sea which happens to fall within the confines of New York City. It is inhabited by fishermen, workers in the garbage and refuse destruction plant and glue makers. Lecturers start across Brooklyn Bridge at three o'clock in the afternoon and do not get back till eleven o'clock the following morning.

Year after year Dr. Leipziger has aimed to enhance the educational value of these lectures, and to accomplish this end the effort has been consistently made to introduce a larger number of connecting lectures. Courses of three, four or five lectures are grouped together in a

series. Whenever practical voluntary written examinations are given at the conclusion of the course and a certificate awarded to those whose papers are satisfactory.

A very large proportion of the lectures are illustrated by the stereopticon, the scientific lectures by charts, maps and experiments. The musical evenings are frequently brightened not by the playing or singing of the speaker alone, but by an illustrative musical program carried out by a company of musicians—as a quartet and accompanist.

Only a great city can afford so elaborate a system for adult education. On the other hand, no city is so small or so poor that it cannot maintain a reasonable free lecture course. The total cost of the New York system is but one-eighth of one per cent. of the total city budget. Considering what this lecture system means to the people, New York could scarce afford not to maintain it.

#### American Hospitals

Undoubtedly the most interesting expression reported from the speeches at the dinner given to Dr. Osler was his own with regard to the hospitals of this country. Tho he was bidding the American medical profession good-by, and criticism was farthest from his thoughts, he did not hesitate to say that in this matter there is room for very great improvement. In every town of 50,000 in this country there is a hospital, from which there should come every year important advances in our knowledge of disease and of its treatment. At the present time, the opportunities afforded in thousands of hospitals are neglected. While there is scarcely a town of 20,000 inhabitants in Germany which has not a medical institution in which good medical work is being done, outside of the large cities here there is no attempt at original medical investigation worth speaking of. Dr. Osler even ventured to proclaim that if our hospital opportunities in America were properly utilized this country could accomplish more for medicine in five years than Germany in ten. Under the present system of hospital management the assistants in the hospitals are young men, who serve for a

year, or at most two, without salary and only for the purpose of familiarizing themselves with the practical side of medicine. The visiting hospital staff is composed of men who are so busy with their practice as to have very little time for original observation or research. It is easy to understand how opportunities for investigation of disease are lost under these circumstances. According to Professor Osler the present evils can be corrected if the resident hospital staff are appointed to serve for a number of years and are properly paid for their services during that period. The responsibility for hospital government is now divided among too many men, and, as a consequence, no one feels it in any personal sense. Besides appointments to the hospital staff are only too often made as the result of political influence, of family tradition, of church prejudice, and not because of merit or of any fitness of the individual to do good work. Dr. Osler himself has shown at Johns Hopkins how much can be accomplished both for progress in medicine and for the highest medical teaching by the proper assignment of responsibility and by the appointment of a resident hospital staff, which maintains its position for many years. When Professor Waldeyer, of Berlin, came to America some three years ago to represent the University of Berlin at the celebration of the Bi-Centennial of the foundation of Yale, he did not hesitate to say, after inspecting our magnificent hospitals in this country, that before many years European students would undoubtedly be coming to us in as large numbers as American physicians now go to Europe. If there is one thing which will soon bring this to pass it is the acceptance of Professor Osler's parting admonition.

#### Religion in Public Schools

There are three of our large denominations that are supposed to favor, more or less, the introduction of religious instruction in the public schools. These are the Catholic, the Lutheran and the Episcopalian. These three denominations have a certain history of the sort behind them, as their practice in Europe has been that way. But it is a serious question whether, even

in the case of the Catholics, the opposition to our undenominational system is not in good part perfunctory and expressed chiefly by the clergy. Certainly in our cities that are Catholic by the majority of their population the public school is as much in favor as elsewhere. That Lutherans and Episcopalians really would change our present system of public schools so as to introduce religious teaching we much doubt, and we are confirmed by the late expression of *The Churchman*, the leading Episcopal paper in the country. It says in its last issue:

"It is because the Church and Christian parents have failed to give the religious instruction that they ought to have given that the demand is made for such instruction in the public schools. With anxiety, it seems sometimes almost with desperation, they ask that the State shall do what the Church has failed to do. The State cannot do what they ask, but the Church can. With renewed zeal and the best educational methods she must supply the religious instruction that the State and its schools cannot give."

That is sound doctrine. It is the business of the Church to teach religion; the State cannot be trusted. And this Bishop Potter sees and says:

"Religious teaching by the State is no novelty—nor blessing. It has been corrupt, or intolerant, wherever it has existed; and usurps a function which belongs, not to the State, but to the Family and the Church. For better or for worse—let him who regards the question as open to doubt call it what he will; I have no slightest doubt upon the subject—our Republican institutions rest upon the declared cornerstone of absolute freedom in religion. The State cannot teach it without being false to the Constitution; and whatever substitute, ethical, speculative or sentimental, she introduces into our public school system, she is equally debarred from being, there, a religious teacher."

#### Chicago University Slandered

We have the following letter from Prof. Shailer Mathews, of the Divinity School of Chicago University, which is sufficiently plain-spoken:

In a recent number of *The Boston Herald* appeared a statement from Rev. A. C. Dixon, D.D., pastor of the Ruggles Street Baptist Church, as follows: "It is an open secret that when Mr. Rockefeller learned that a prominent representative of Chicago University was tear-

ing the Bible to pieces in a course of lectures he ordered the lecturer to cancel his engagements and go to Europe for the purpose of purchasing a library." Dean Small, of the Graduate School, and I as Dean of the Divinity School, immediately wrote Dr. Dixon asking for the name of the person to whom he referred, and the evidence for such a remarkable and, to one who knows anything of Mr. Rockefeller's relations with the university, incredible statement. He replied that the person was President Harper; and, as his only evidence, he offered this bit of gossip:

"The open secret to which I referred floated through certain circles in Greater New York when I was there as pastor. It was reported that President Harper, when delivering a course of lectures, was requested by Mr. Rockefeller to go to Europe to purchase a library, and it was given out widely, as a sort of open secret, that the reason for this sudden request was that the learned president was tearing the Bible to pieces in a way that did not please Mr. Rockefeller."

There have been many irresponsible and deliberate maligners of the University of Chicago, who when challenged have confessed that their statements were based upon no evidence, but who nevertheless have been too dishonorable to detract what they have known to be untrue. In view of the hopelessness of obtaining correction of misstatements, even in the face of proof, it has generally been idle to deny gossip and lies and better to trust to the sober sense of the public. Dr. Dixon's position as a pastor and evangelist is so prominent, however, that it seemed to me possible that here at last might be found a man who would withdraw his statement when furnished with evidence of its incorrectness. On receipt of his letter I immediately telegraphed him denying on the authority of Dr. Harper himself the statement in particular and in general, and saying that justice demanded an immediate public correction. I find, however, that I have been disappointed in my hopes. Dr. Dixon has made no correction. I am therefore forced by means of the press to correct the slander and declare to the public, as I have already declared to Dr. Dixon, that his statement is false in general, in particular and in implication.

All we can say is that Dr. Dixon ought to be ashamed of himself, unless he ventures to reply that he does not believe President Harper's denial.

There is serious danger in the present complication between Japan and France. The evidence seems conclusive that the French authorities in Cochin-China have given aid, against all international law,

to Russia in their harbors. The Russian fleet have used French ports as freely as if they were their own, and have there taken their coal and other supplies. They have been allowed to remain long after the twenty-four hours' limit, and have been ordered away only when they did not need to remain any longer. This is tantamount to belligerent action against Japan, and Japan might perhaps call on Great Britain to accept her duty as an ally under the treaty. We believe this action is not due to M. Delcassé's fault, but to the guilty connivance of the Governor at Saigon. We hope it will not compromise the harmony between Great Britain and France, but it is a wanton wrong and it renders France liable to heavy damages before The Hague Tribunal.

Sir Frederick Treves, who stands at the head of the surgical profession in England, has stirred the people by declaring that alcohol is a poison, that it is an injury to the system when taken even in a moderate degree. He would favor the extreme of total abstinence. Being a surgeon he has seen the effect of the use of alcoholic liquors on the system of those who have to be operated upon, and who recover from the knife with less success than do those who use little or no such beverages. The use of liquors in Great Britain is decreasing, and public sentiment is more and more against them. Even in Russia the Old Believers, a very rich community, are total abstainers. In Scotland they are trying to get a law passed by Parliament allowing local prohibition of the liquor traffic.

Argentina and Chile have been our shining examples in the lesson of peace and arbitration. Have they not made the broadest treaty of arbitration in the world's history, and disposed of their navy, and built on the Andes a colossal statue of the Messenger of "Peace on Earth"? What is this we now hear, that President Quintana, of Argentina, says that the fleet must be built, to "maintain a predominating position in South America"? That news will throw a damper in the Mohonk Conference for Arbitration soon to meet.

# Insurance

## Physician's Liability Insurance

THE legal liability of a physician to his patient is exceedingly complex. Few practitioners realize the full extent to which the term malpractice applies under the law. For example, it would seem ridiculous to say, if a physician went away on a vacation without notifying his patients, he could be sued for malpractice, and if found guilty as charged, that he could be made to pay heavy damages. Yet that very case happened not long ago and references are made to it in the literature issued by a prominent local casualty company. Many other cases are of record as apparently unreasonable. The professional man is constantly menaced by dangers such as these. Then there are costly schemes originated by blackmailers and their able lieutenants, unscrupulous lawyers. In addition there is also the liability to error that is ever present with even the best physician. A case of this kind took place when a physician was vaccinating the children of a patient of his. One of the children complained of having something in her eye. The vaccinating doctor endeavored to extract the offending substance. In his haste he overlooked sterilization, and his unwashed hands contaminated the little girl's eye with some adhering virus, constituting malpractice.

To protect the physician against these and other liabilities physician's liability insurance has been instituted, and for a premium of ten dollars per year the physician is protected against all liability to the extent of five thousand dollars under certain policy limitations. The policy expressly stipulates that the insuring company is not liable if the assured or any assistant shall have violated any law or ordinance in connection with any matter giving rise to any claim arising under the policy in force, nor if any alleged error, mistake or malpractice has happened while the assured is more or less under the influence of intoxicants, anesthetics or narcotics. This form of insurance is very desirable for the reputable physician, because a claim may be made against him at any time, and such a claim, no matter how unjust, always inflicts incalculable injury. Unjust claims

are less likely to be pressed if a strong insuring company is necessarily a party to any suit that may be brought.

## The Federal Supervision of Insurance

THE subject of Federal supervision was considered and expounded by Ralph W. Breckenridge, of Omaha, in a lecture which he delivered at Yale University on May 5th. Federal supervision was advocated by the lecturer. Mr. Breckenridge declared that if Congress should see fit to provide for complete national supervision of insurance it would accomplish an important and much needed public service. The maximum of needed corporate publicity could be thus secured in the most satisfactory manner. The effect of national supervision would not only benefit the policy holders, but its effect would likewise tend toward the protection of the corporations themselves against unjustifiable and malicious attacks. Grafting would not be so easy of accomplishment under Federal supervision. Other points made by Mr. Breckenridge were in brief as follows:

"Interstate insurance is 'commerce among States' and the general good requires its regulation as such. The duty of Congress is plain, and no phantom of State rights should intervene between that duty and its performance.

"The original purpose of State supervision was to expose the weakness and fraud of irresponsible companies, but latterly the great accumulation by the companies of money in sight has proved too strong a temptation for the States to resist. Accordingly whenever the need for funds has presented itself, as it almost constantly has, an onslaught has been made by the State Legislatures upon the money held in trust for the people by the insurance companies, until now the States receive from the companies doing business in the United States under varying forms of exactions a sum that has never been definitely calculated, but which is estimated at from \$20,000,000 to \$25,000,000 a year.

"But this is not all. It is within the experience of nearly all companies, fire and life, that they have served as bankers for dishonest petty officials connected with many State insurance departments, who have boldly levied blackmail. This is a scandal that no self-respecting people can allow to continue."

# Financial

## Control of Trolley Competition

As the policy of the New York, New Haven & Hartford Railroad Company, with respect to the purchase of the electric street railway systems of cities on its main lines, will probably be adopted by other steam railway companies (as it has been, to some extent, by the New York Central), recent opposition to such purchases in Massachusetts deserves consideration. Under the Massachusetts statutes the Boston & Maine Company (the other great railway corporation of New England) cannot make such purchases. Therefore it could not lawfully compete with the New Haven Company for the possession of the Springfield trolleys. It asks the Legislature for such an amendment of the statutes as will permit it, a Massachusetts corporation, to do in its own State what the New Haven, a foreign corporation, has freely done there. By a vote of 111 to 74 the House has passed the desired bill. Incidentally, the Massachusetts Attorney-General, Mr. Parker, has sent to the Legislature an opinion that the New Haven's purchase of the Springfield, Berkshire and Worcester and Southbridge trolley systems was illegal, exposing to forfeiture the trolley companies' charters and also a Massachusetts charter which the New Haven Company possesses. By some he is urged to test this opinion in the courts. If the pending bill should become a law, however, there would be no warrant for such proceedings, and a general acquisition of trolleys by steam roads in New England would be very perceptibly promoted. Such acquisition and the resulting suppression of competition are opposed by a considerable number of persons as being harmful to public interests.

Owing to recent purchases, a trolley company, the Boston & Worcester, has cleared the way for a continuous trolley line from Boston to Hartford, but it can scarcely hope to prolong its line to New York. Probably the movement for the repeal of Connecticut's general railroad law—which, if successful, would compel the projectors of com-

peting parallels to obtain authority from the Legislature by special act—is aimed both at this trolley line and at the New York Central's menacing surveys for a new line between New York and its leased Boston line at Springfield. The competition of trolley lines, owing to low fares and the growing practice of carrying light freight and express merchandise at low rates, invites purchase by steam companies for control. It will be controlled in that way, and the first exhibition of this method on a large scale will be seen in Southern New England.

....The Baltimore & Ohio Railroad Company has awarded contracts for 10,000 new freight cars, the cost of which will be about \$12,000,000. This is the largest single order of its kind ever placed by an American railway company.

....The latest edition (corrected to March 31st) of that very useful and trustworthy book, *The Directory of Directors*, has just been laid before the public. This work, compiled and published by the Audit Company of New York, is now in its seventh year, and has grown in volume from a list of 12,000 names to 21,000. Its first part contains a complete alphabetical list of Directors or Trustees having New York City addresses, followed by the names of the companies with which each is connected. In the second part are to be found selected lists of corporations in banking, insurance, transportation, manufacturing and other lines of business, alphabetically arranged, accompanied in each case by the names of the company's principal officers and of all its Directors or Trustees.

....Dividends announced:

Atch., Top. & S. F. R'way Co., Common, 2 per cent., payable June 1st.

Amer. Chiclé Co., Common, 1 per cent., payable May 20th.

Amer. Cotton Oil Co., Preferred, 3 per cent., payable June 1st.

Niles-Bement-Pond Co., Preferred, 1½ per cent., payable May 15th.

International Silver Co., First Mort. Coupon No. 13, payable June 1st.

# The Independent

VOL. LVIII

NEW YORK, THURSDAY, MAY 18, 1905

No. 2946

## Survey of the World

Mr. Roosevelt on  
Railway Rates

The President left Glenwood Springs, Col., on the morning of the 8th and arrived in Washington on the night of the 11th, having stopped for a few hours on the way at Denver, and again at Chicago, to attend banquets at which he was the guest of honor. His speeches concerning the regulation of railway rates and the enforcement of law during labor controversies excited comment throughout the country. After his address in Denver the representative of an Omaha paper directed his attention to published predictions that a failure of Congress to enact such a railway law as he desired would compel him to accept a renomination in 1908. This paper on the 10th published the following as a statement made by him in reply:

"You are authorized to state that I will not again be a candidate for the office of President of the United States. There are no strings to this statement. I mean it. I made my speech at Denver for the purpose of convincing the people of my earnestness in regard to the matter of railroad legislation. I will not be satisfied with any compromise that does not bring relief to the people from the conditions that now exist in regard to transportation affairs in the country. No compromise bill from Congress will be accepted."

At Denver, speaking at the banquet of the Chamber of Commerce, the President said that the policy of extending the powers of the Commission and of giving it the power "to fix rates and to have the rates that it fixes go into effect practically at once" represented part of what should be the general policy of the country—the policy of giving, not to the State, but to the National Government, "an increased supervisory and regula-

tory power over corporations." We had seen railway systems grow up, each controlled by a single corporation or individual, "sometimes several of them controlled in combination by corporations or by a few individuals":

"When such is the case, in my judgment it is absolutely necessary that the Nation—for the State cannot possibly do it—should assume a supervisory and regulatory function over the great corporations which practically control the highways of commerce. . . . I wish to urge with all the earnestness I possess, not only upon the public, but upon those interested in the great railway corporations, the absolute need of acquiescence in the enactment of such a law."

But the desired legislation would do more harm than good if the people should not be as zealous to do justice to the railroads as to exact justice from them. "We must be careful to see that the law is administered with sanity and conservatism." Referring to the disapproval of his action concerning the Panama Canal by "many most admirable gentlemen," he said that he was in an unrepentant frame of mind. "The ethical conception upon which I acted was that I did not intend that Uncle Sam should be held up." He thought the Canal would exercise a regulatory influence upon our transcontinental commerce, and that railroads "would have to revise their way of looking at the interests of certain inland cities."—In his address at Chicago before the Iroquois Club (the leading Democratic organization of Illinois) the President repeated much that he had said in Denver. He trusted, he said, that there would be no halt in the steady process of assuming national control over great corporations. Concerning railroads:

"I believe that the representatives of the nation should lodge in some executive body the power to establish a maximum rate, the power to have that rate go into effect practically immediately and the power to see that the provisions of the law apply in full to the companies owning private cars just as much as to the railroads themselves."

He repeated his promise, made in the Southwest, to appoint just Commissioners, and once more pointed out the dangers of class hatred and class rule. At this reception of a Republican President by one of the oldest Democratic clubs in the country he was greeted with great enthusiasm. The tone of some of the addresses even suggested that the speakers did not regard his nomination in 1908 by the Democratic party as an impossibility. Replying to one who said that exigencies might arise to make him reconsider his decision as to a renomination, he remarked that he had no anticipation of Chicago's ever reversing its highly complimentary vote for himself in November last, because Chicago would never have a chance to do so.

#### Secretary Taft on the Same Question

The policy of the Administration was sharply defined on the evening of the 9th by Secretary Taft at a dinner in Washington before an audience of 300 prominent railway men, members of the International Railway Congress. He declared emphatically that railway rate legislation must come, and that if the railroad corporations were wise they would promote it. They should "stand up and assist":

"I am the last one to argue in favor of Government ownership. I think nothing could come to this country that would be so unfortunate in its effect as the Government ownership of steam railroads. And we are not going to come to it, but we may have a campaign on this subject which will do no good to the railroads."

President Stuyvesant Fish, of the American Railway Association, at once responded, saying the present law against rebates and other forms of discrimination was sufficient. Whereupon the Secretary spoke again. As a judge he had run railroads for ten years through receivers, and it was very hard

sometimes to get receivers who would not cut rates. It was his understanding that the law required was one empowering the Commission to fix a maximum rate in litigated cases and to prevent delay. He reminded Mr. Fish of the action of his own company concerning a claim of discrimination against a small town. Five years were required for reaching a decision, and in the meantime the town was wiped out by a tornado. Mr. Taft's remarks were made nearly twenty-four hours after the President's address at Denver. Some in Washington think that they were suggested by the President. The latter may have desired to have a representative of the Administration correct an impression due to Secretary Paul Morton's recent address before the same railway men, an address which was not in harmony with the President's policy. On the day following the President's return to Washington it was announced by Secretary Morton that he intended to resign within a few weeks, probably at the end of July.

#### Mr. Roosevelt to the Chicago Unions

While the President was in Chicago a committee of labor leaders called upon him, presenting a written protest and argument against the use of Federal troops during the teamsters' strike now in progress. After reading this, he said that no one had suggested to him that he should take any action. He knew nothing, he added, about the merits of the controversy. He then continued as follows:

"I want to say one thing with all the emphasis in my power. In upholding law and order, in doing what he is able to do to suppress mob violence in any shape or way, the Mayor of Chicago, Mayor Dunne, has my hearty support. I have not been called upon to interfere in any way, but you must not misunderstand my attitude. In every effort of Mayor Dunne to prevent violence by mobs or individuals, to see that the laws are obeyed and that order is preserved, he has the hearty support of the President of the United States, and in my judgment he should have that of every good citizen. I am a believer in unions. I am an honorary member of one union. But the union must obey the law, just as the corporation, and every man, rich or poor, must obey it. If action by me is called for I shall

try to do justice to every man. But the first essential is the preservation of order, the suppression of violence by mobs and individuals."

The President's emphasis was due partly, as he said, to the "unfortunate phrasing" of passages in the protest which were not complimentary to the army and seemed wanting a little in respect for the President himself, because the heat of the writer's rhetoric had got the better of his judgment. In his speech at the banquet that evening Mr. Roosevelt said to Mayor Dunne that as a matter of course he gave him hearty support in upholding the law and putting down violence. Those responsible for preserving order should exhaust every effort before calling upon any outside authority. "But if ever the need arises, back of the city stands the State, and back of the State stands the Nation."

#### **Municipal Utilities in the West**

By a decision of Judge Grosscup the way has been cleared for the ownership and operation of a part of Chicago's street railway system by the city. He has denied a motion for an injunction to prevent the city from taking possession of the Adams Street line, and has declared that the franchise for this line expired in April, 1904. The city thus gains control of about ten miles of track, extending from the business district to the boundary. Mayor Dunne thinks that this property can be made the nucleus of a complete West Side system. The same Judge has made another decision, naming the North Side streets which the Union Traction Company is legally entitled to occupy until 1959, under a ninety-nine year franchise from 1858. This decision covers nearly all the trunk lines on the north side of the city. On seven streets, however, the franchises are shown to have expired two years ago. In this case the city will take an appeal. It will also begin without delay a suit to establish the validity of the Mueller certificates, or income bonds, by means of which the coming municipalization of the railways is to be financed. A Chicago newspaper has sent a member of its staff to Glasgow and has published many cablegrams and letters from him relating to the municipal

railways of that city and to the methods of the municipal government. The law enacted by the Illinois Legislature two weeks ago empowers the Chicago city authorities to fix a maximum price for gas for periods of five years, and it is expected that under it the price will be reduced from \$1 to 75 cents. Among the other new laws is one for compulsory direct primary nominations for the offices of Governor, United States Senator, member of the national House and member of the Legislature, but it will not be in force until next year. The Chicago Mayor's term is extended from two to four years. Another law provides for the removal of any sheriff who permits a prisoner to be lynched and for the payment of damages by the county to the relatives of the lynched prisoner. —At conferences between Mayor Johnson, of Cleveland, and the officers of the street railway company in that city, the Mayor has shown that the average date on which the franchises will expire is about six years hence. He estimates the present worth of them to be from \$8,000,000 to \$9,500,000, and the value of the tangible property to be about \$12,000,000. The company wants a franchise extension of 25 years and promises a reduction of fares to the neighborhood of 4 cents. Mayor Johnson insists upon 3 cents and has offered the desired extension if the company will place the entire property in the hands of trustees representing both the city and the company, who shall operate the road, pay interest on the bonds and 5 per cent. on the stock, and devote the surplus to reducing fares, the city having an option to purchase at any time, if authorized by the Legislature to do so. He is confident that under such management it would soon appear that fares could be reduced to 3 cents.

#### **Philadelphia's Gas Works and Government**

Owing to a forcible popular protest against the proposed new lease, for more than 50 years, of the Philadelphia gas works (a lease whose remarkable features we described two weeks ago) the Councils of that city have consented to invite competitive bids. To the opposition of the press and many citizens

was added that of the Mayor, who was at first believed to be in sympathy with the politicians who had set out to give to the present lessees this extension of their term under conditions which would prevent such reductions of the price of gas as are provided for in the existing contract.—At its recent session the Pennsylvania Legislature passed several bills, commonly called “rippers,” transferring from the Mayor of Philadelphia to the Councils the power to appoint several prominent executive officers. Last week Governor Pennypacker approved two of these, which empower the Councils to elect the Director of Public Safety (who controls the police and fire departments) and the Director of Public Works, who controls important contracts. These officers are to be chosen by the municipal legislators, who are commonly believed to be under the control of certain powerful politicians who were followers of the late Mr. Quay. Bills making a similar change with respect to two or three other heads of departments were vetoed. In support of his approval of the bills first mentioned the Governor gives to the people a long argument designed to show that concentration of power is dangerous and much more harmful than a distribution of it. This interesting document, which is ridiculed by the Philadelphia newspapers, cites the examples of Charlemagne and Lincoln, of Nero and Robespierre, of the Anabaptists of Munster and of other figures in ancient and modern history. The Governor thinks Philadelphia is in greater danger of suffering by reason of a corrupt Mayor than on account of boss-controlled Councils, and he naïvely admits that he has sought the advice of “the most influential political leader in Philadelphia,” who tells him that the present system is harmful to the municipality. In this the people see a reference to a well-known local boss. The newspapers of the city ransack their vocabularies for words to express their indignation. By the leading paper of his own party the document is characterized as contemptible, “worse than childish, a medley of irrelevance, fustian and puerility,” containing “passages which are simply

grotesque and which will excite derision wherever they are read.” This paper asserts that the approved legislation was “part of a design of which the gas works conspiracy was the second chapter.” Other papers express the same opinion. On the 13th the Governor reduced by about \$1,000,000 the Legislature’s appropriations for the asylums for the insane, and vetoed certain bills for monuments in honor of Revolutionary heroes, his reason being that economy was needed. He then approved the bill appropriating \$25,000 for a statue of the late Mr. Quay on the capitol grounds.

#### Dynamite in a Railway Collision

An accident of an extraordinary character, attended by the loss of at least 22 lives, occurred on the Pennsylvania road, in the outskirts of Harrisburg, at a little before 2 o’clock on the morning of the 11th. As a very long freight train was moving slowly eastward, a sudden application of the air brakes caused it to “buckle,” and two or three of the cars toppled over upon the adjoining track in the path of an approaching west-bound passenger train. This was the Cleveland and Cincinnati Express, consisting of six Pullmans, two day coaches, and a baggage car. Its speed is said to have been 40 miles an hour. One of the unlucky freight cars before it was loaded with 20,000 pounds of dynamite. As nearly as can be ascertained, the collision was followed at first by the explosion of gas tanks under the passenger cars, and, five minutes later, by the explosion of the dynamite, which was in 400 boxes. Almost immediately the passenger cars and the freight cars were in flames, and the heat was so intense that rescuers could not draw near. Several who had been asleep in the Pullmans were blown out of the wreck and down an embankment to the neighboring river. Others were consumed with the cars, which were burning until 7 a.m., when, of the passenger train and a dozen freight cars, only the twisted iron work remained to be seen. Several bodies were in such a condition that they could not be identified; it is believed that others were completely consumed. Among the dead were James R. Phillips, a million-

aire manufacturer of tin plate; V. L. Crabbe, son-in-law of the assistant of the President of the Pennsylvania road, and Samuel S. Shubert, a well-known theatrical manager. Another millionaire, Charles Donnelly, was seriously hurt, and among those slightly injured were the daughter of Senator Knox and Vice-President Bope, of the Carnegie Steel Company. This accident has directed attention to the practice of carrying high explosives on the railroads. Such freight is accepted by nearly all the roads. The Lackawanna is one exception. One railway officer suggests that dynamite and similar explosives should always be carried on a special train covered by red flags. A bill for the regulation of such transportation under the direction of the Interstate Commerce Commission was introduced in the Senate last year, but encountered effective opposition. At the coming session of Congress there will probably be a demand for such control of this traffic as has been exercised by the Government in England for many years past.

#### Many Killed by Tornadoes

The village of Snyder, Okla., was almost wholly destroyed on the evening of the 10th inst., by a tornado that also caused much loss of life in neighboring settlements. Nearly every building in the place was wrecked. At last accounts the bodies of 95 of the dead had been found; 35 persons were missing, 115 were seriously injured. It was expected that 20 of these would soon die. In settlements near Snyder about 25 persons were killed. Among those who lost their lives in Snyder were W. H. Hibbard, the superintendent of schools, his parents, his wife and his two children. Of the Fassenden family of seven persons not one survives. The injuries of some of the victims of this storm were of a shocking character. Several persons were decapitated. Others were pinned to the ground by huge splinters from the buildings. A man whose left arm was torn away found a severed hand and thought at first that it was his own. But when he realized that it had been the hand of a right arm, he became crazy.—At midnight, on the 8th, a tornado cut a swath 200 yards wide

through Marquette, Kan., which is near the center of the State, killing 26 persons and injuring 44. Two churches, an opera house and many dwellings were destroyed.

#### Sanitation in Cuba

It appears that our Government has recently reminded Cuba of the requirements of the Platt Amendment concerning sanitary work in the cities. On the 28th ult., President Palma sent to Congress a message relating to the projected paving and sewerage of Havana. It was a matter of serious importance, he said, being within Cuba's obligations to the United States, and having been specifically mentioned not only in the Amendment but also in the letter of General Wood when he transferred the Government to the Cuban people. Moreover, the Washington Government understood that a contract for the work (to McGivney & Rokeby, for \$10,393,000) had been awarded during the period of intervention to American bidders. He added that the United States, in a note to the Cuban Government, had spoken of this and had expressed a desire that the work should be taken up and carried to completion. This note also referred to similar improvements at Santiago and to the water supply there. The Senate, without debate, adopted a resolution asking for copies of the correspondence with the United States. President Palma had urged Congress to appropriate the money required.—On the preceding day, the House passed the Senate bill appropriating \$1,500,000 to assist the larger cities in their sanitary work.

#### Yacht and Autoboot Races

The race of the autoboots across the Mediterranean came to a disastrous conclusion owing to a frightful storm. All of the seven boats were sunk or disabled, but the crews were rescued by the vessels of the French navy, which accompanied them. The course was from Algiers to Toulon, and French, Italian and German boats competed. The British and American boats arrived too late to take part in the race. The autoboots left Algiers May 7th at 6 a.m., and the first arrived at Port Mahon, in the island of Minorca, in 15

hours. After leaving Port Mahon the next morning the storm broke, the waves running so high that the autoboots could do nothing and were obliged to be taken in tow by the torpedo boat destroyers and cruisers. This also was soon found impracticable, for the sea was so violent that it broke the steel hawsers, so the crews were taken off the autoboots with great difficulty, but without loss of life, after which the boats were cast adrift and most of them sank.—The international transatlantic yacht race for the Kaiser's cup starts from Sandy Hook May 16th, at 3 o'clock. A telegram of greeting and good wishes was received from the Emperor William before the start. The following boats entered: The "Ailsa," under the management of Grenville Kane, with a crew of 18 men; the "Apache," Edmund Randolph, owner, with a crew of 40 men; the "Atlantic," Wilson Marshall, owner, Charles Barr, captain—the most modern of the yachts and with the fastest racing record—50 men; the "Endymion," a schooner with 25 men, Commodore George Lauder, owner; the "Fleur de Lys," the smallest of the boats, owned by Dr. Lewis A. Stimson, crew 16 Gloucester fishermen; the "Hamburg," a German boat, entered by request of Emperor William, a schooner with a crew of 28; the "Hildegard," owned by E. R. Coleman, crew 24; the "Sunbeam" of Lord Brassey, 29 men; the "Thistle," Commodore R. E. Tod, owner, 26 men; the "Utowana," owned by Allison V. Armour, 34 men; the "Valhalla," the largest boat in the race, owned by the Earl of Crawford, 66 men. All the boats carry from three to seven guests each. The "Endymion" has made the best transatlantic record of 13 days 20 hours.

**Russian Riots and Reforms** The second conference of the zemstvoists was held at Moscow May 5th to 12th, and resulted in the adoption of more definite plans for carrying out the reforms recommended by the first meeting, which was held in St. Petersburg last November. The November meeting was called by permission of Prince Sviatopolk-Mirsky, then Minister of the Interior, but it was con-

demned by the Czar, who, nevertheless, was compelled within two months to officially proclaim his intention to carry out many of their proposals. Like its predecessor, the recent conference had no official status, and was held in a private house, the residence of Prince Dolgorukoff. There were 132 delegates, as compared with 104 in November. Twenty-seven of the zemstvos regularly elected four delegates each, but seven were prevented from doing so by the Marshals of Nobility, who are *ex officio* their presidents. These zemstvos were represented by the same members as in the former conference. After a discussion of the best form of a National Congress for Russia it was voted to recommend a system modeled after that of the United States: a lower house elected by universal suffrage and an upper house elected by the zemstvos (district assemblies) and dumas (municipal councils), which are to be made more democratic by including a larger proportion of peasant representatives. The resolution in favor of universal suffrage was carried by a vote of 127 to 8. A faction of the zemstvoists of the November conferences who are in favor of making the Assembly merely a consultative body without legislative powers are being organized by Mr. Shipoff at St. Petersburg, under the title of "Liberal Progressists," and, together with the Marshals of the Nobility, are holding an opposing conference at St. Petersburg to express their views, which they claim are more in accord with Slavic institutions.—The London *Jewish Chronicle* announces that the position of the Jews in Russia will soon be greatly relieved and that it is probable that they will be given absolute freedom of residence in all cities and towns. In the meantime anti-Semite riots are of common occurrence in many parts of the empire. In Zhitomir, the capital of the Government of Volhynia, Southwestern Russia, inter-racial riots broke out and continued for several days. Eighteen persons were killed, all but three of them Jews, and over a hundred wounded. The Government lays the blame for the disorder on the Jewish revolutionists. In Kishenev the soldiers of the Fifty-third Infantry pil-

laged the Jewish shops in St. Nicholas Street for several hours. In Simferopol 140 Jewish shops were burned.—The Old Believers have decided to give \$500,000,000 to double-track the Trans-Siberian Railway in gratitude to the Czar for granting them freedom of worship.

#### French Neutrality

The long continuance of the Russian fleet in the ports and coastal waters of French Indo-China excited the temper of the Japanese papers to fever heat, and the British press has echoed its warnings that France by the aid which she has given her ally is assuming the attitude of a belligerent rather than that of a neutral Power. The formal protest of the Japanese Minister in Paris alleged eight specific breaches of neutrality by the Russian fleet in visiting Cherbourg, Dakar, Algiers, Jibutil (Africa), Majunga, Nossi-Bé (Madagascar), Kamranh Bay and Port d'Ayot (Indo-China). It is claimed that in resorting to these harbors and in staying in them while taking on coal and supplies, making repairs and bringing together different divisions of the fleet the Russians have violated the French rules of neutrality, which state that "belligerents cannot make use of the ports of France for purposes of war or to obtain arms and ammunition or to execute works with the object of increasing their military power." The Japanese Government is therefore impelled to the following conclusions:

"First—Without impugning the good faith of France, the Japanese Government thinks that the French instructions were inadequately carried out.

"Second—If satisfaction has been given the Japanese observations after the event, it was a pity that more active watchfulness was not practiced before, thereby preventing deeds that Japan considers breaches of neutrality.

"Third—Japan does not ignore the complexity of questions of maritime neutrality or France's predilection for her own particular rules; nevertheless she considers that the aid assured Admiral Rojestvensky owing to slovenly surveillance greatly assisted the accomplishment of his mission and his advent into the Chinese seas."

In reply to this the French Government

points out that there is, strictly speaking, no code of international law—each Power has its own. The French regulations on this subject were adopted at the beginning of the war between Spain and the United States and have not been objected to by any Power. France has never accepted the principle, which insular Powers such as England and Japan desire to have established, of limiting the time which belligerent vessels may stay in a neutral port. The coal supplied to the Russian fleet was obtained from the English and Germans, but Tokyo has made no protest against their action. Coaling was done outside of territorial waters and war vessels have not remained close to the shore. In the case of the Indo-Chinese ports the French Government did all that it could be expected to do in view of the long extent of coast line to be guarded and the absence of telegraphic communication. The amount of coal bought at Saigon and Kamranh was not large. Instructions were sent out to provide the fleet with only enough to take it to Vladivostok. The Russian cruiser "Diana" has been safely kept in Saigon by withholding essential parts of her machinery. A Japanese squadron has been cruising for two months in the waters of Singapore, Borneo and the Philippines without protest. And finally, the French reply states that all the privileges allowed to the Russian fleet would have been as freely permitted to the Japanese if Admiral Togo had gone to meet his enemy at the entrance of the Red Sea. Therefore, since the repairs and purchases of the fleet have been so insignificant and no use has been made of French ports for purposes of war, it cannot be claimed that the French have violated their neutrality, but, on the contrary, they have used all possible efforts to insure absolute impartiality. In a reply to this Baron Suyematsu, a son-in-law of Marquis Ito and former Minister of the Interior, holds that France should have prevented the unlimited coaling of the fleet within territorial waters, and that, having been warned in advance by Japan of the rendezvous of the Russian fleet at Madagascar and Indo-China, the necessary precautions should have been taken to

prevent the use of French waters for strategical purposes. Marquis Bar-télemy, who since 1900 has had a concession at Kamranh Bay, states that the coal stored at that port did not exceed 800 tons, but that the Russians at the beginning of the war bought a large tract of land on the Mekong River, near Saigon, and stored coal there in sheds for the fleet.—It is popularly believed in France that the Japanese intend eventually to take Indo-China from the French and are making the most of the present difficulty in order to have a pretext for attacking the colony when their hands are free. Military plans, purporting to have been secretly obtained from the Japanese Government, for an invasion of the French possessions from the island of Formosa by occupying Kamranh Bay and other unprotected points on the coast and marching southward, were made public in Paris a few months ago.

#### The War on Sea and Land

The Japanese have made extensive preparations for the defense of Formosa and the Pescadores. [For a description of the Pescadores and a map, see THE INDEPENDENT for February 16th.] The Pescadores Islands have been supplied with provisions and ammunition for two years and heavy guns mounted in strategic positions. In Formosa the ports of Keelung and Tamsui are strongly protected by mines. The garrison is estimated at 15,000 men. The island is declared to be under martial law and in a state of siege. A large part of the Japanese fleet, said to number eighty-five vessels, is stationed here, ready to attack the Russian squadrons as they advance northward. Some of the Japanese cruisers are doing patrol duty in the Korean Straits.—The floating mines, adrift from Port Arthur, still continue to make trouble. The Japanese transport "Sheyutsu," with 1,800 tons of provisions bound for Niuchwang, is reported to have struck a mine which blew away the after part of the vessel. She signaled a passing merchantman that she was in distress, but refused aid when she learned that it was a Chinese ship and it is supposed that she sank with all on board. On May 13th the Japanese steamship

"Sovralence," going from Niuchwang to Kobe, Japan, was also sunk by floating mines off Port Arthur and twenty-eight men were lost.—Admiral Nebo-gatoff's squadron has now joined the rest of the fleet, but it is reported to be in need of repairs before going further. The hospital ship "Kogtgoma" is in Saigon harbor. Most of the Russian fleet was last reported off Honkohe Bay, ten miles out, but some of the vessels are at Vanfong Bay and others near the island of Hainan.—The French have made a beginning at enforcing neutrality by seizing the British steamer "Carlisle" when it entered Saigon harbor. This is the vessel which has been for a long time in Manila Bay for repairs, and attempted to go to Vladivostok, but the crew struck. Her cargo was stated to be purely commercial, but the French authorities examined it and found war stores.—General Kuropatkin has been relieved of the command of the First Manchurian Army and recalled to St. Petersburg. He complains that his orders in regard to the disposition of troops about Mukden were not obeyed. If troops had been placed as ordered the Japanese would not have broken through the center of the Russian lines on the Hun River east of Mukden.—There have been many skirmishes between the forces on the railroad north of Kaiyuan, but Oyama's expected advance seems to be waiting upon the naval movements. To counteract the exaggerated reports of sickness in the Russian army the following statement has been furnished from headquarters at Gunshu Pass, giving all the sick and wounded in Manchuria and Eastern Siberia:

"In hospitals—Wounded, 769 officers and 14,904 men; sick, 1,157 officers and 13,018 men. In sanitary trains—Wounded, 35 officers and 774 men; sick, 45 officers and 772 men. In hospitals for convalescents—Wounded, 216; sick, 332."

—The Emperor of Japan has given \$5,000 to the Japanese branch of the Young Men's Christian Association on account of their efficient service in providing for the mental, physical and moral needs of the soldiers in Manchuria during the war.

# A Reply to Dr. Gladden

BY STARR J. MURPHY

OF PERSONAL COUNSEL TO MR. JOHN D. ROCKEFELLER

IN an article in THE INDEPENDENT of April 20th, entitled "The Church and the Reward of Iniquity," Dr. Washington Gladden charges Mr. John D. Rockefeller with having committed perjury in that when he was examined under oath before a committee of the New York Legislature concerning the South Improvement Company he took part in the following colloquy:

"There was such a company?"

"I have heard of such a company."

"You were not in it?"

"I was not."

Dr. Gladden follows this by saying: "Mr. Lloyd appropriately adds, 'So help me God.'"

Throughout the entire article Dr. Gladden makes much of his position as an original investigator, and says that it is within the power of every intelligent man to find out from the original documents whether the statement is true or not. An examination of the original documents shows that his statement is untrue and that his whole charge of perjury rests upon a garbled report. The questions and answers which he quotes are taken from a report on "An Investigation Relative to Trusts, New York Senate, 1888," pages 419-420. Any one turning to that report will find that the company concerning which Mr. Rockefeller was being interrogated was not the South Improvement Company, as Dr. Gladden states, but the Southern Improvement Company.

In a former article, published through the Associated Press, I called Dr. Gladden's attention to this fact, and also to the fact that these were two entirely different corporations; that the Southern Improvement Company was incorporated by act of the Pennsylvania Legislature, approved April 16th, 1870, and that the South Improvement Company was incorporated over a year later by an act approved May 6th, 1871; that both of

these charters are printed in full in the Statutes of Pennsylvania and are accessible to all; and that tho Mr. Rockefeller was connected with the South Improvement Company he had no connection with the Southern Improvement Company, and therefore that his testimony quoted above was true.

In a published reply, under date of April 29th, Dr. Gladden was compelled to admit that my statement was true, that the corporation concerning which Mr. Rockefeller was examined was not the South Improvement Company, but the Southern Improvement Company. He, however, challenges my statement that there were two corporations. He says he has searched the records to which I cited him and has not been able to find the charter of the South Improvement Company, and says: "No such company was incorporated on the day he names, May 6th, 1871." As Dr. Gladden says that he has succeeded in finding the act to incorporate the Southern Improvement Company it is unnecessary to refer to the page where that is printed. If he will take the Laws of Pennsylvania for the year 1872 he will find in the Index, page 1438, the following:

"Improvement Companies, South, Act to

Incorporate ..... 1,278.

"Repealed ..... 715."

If he will turn to page 1278 he will find it entitled "Appendix, 1871," and on that page, set forth in full, the charter of the South Improvement Company, approved the 6th day of May, 1871, as I had previously informed him.

Notwithstanding that Dr. Gladden's attention had been specifically called to the fact that these two corporations were entirely distinct, and he had been given the dates of their respective charters, he says in his reply to my article that "the Southern Improvement Company was the name of the company whose charter was purchased by Mr. Rockefeller and

his friends." This shows the most amazing recklessness of statement. In his article in *THE INDEPENDENT* he said: "The South Improvement Company was one of the schemes invented by the Standard Oil magnates to plunder their competitors." He now says that its name was the Southern Improvement Company. There is absolutely no foundation for this latter assertion, and his only reason for making it is his desire to disentangle himself from the net in which he is enmeshed. The falsity of the statement is easily demonstrated. His chief authority, Miss Tarbell, in her "History of the Standard Oil Company," Vol. I, page 94, says that the charter of the South Improvement Company was repealed by the Legislature, and the agitation which led to this repeal is mentioned in Dr. Gladden's article. If he will look at page 715 of the Statutes above referred to he will find the repealing act. It is entitled "An Act to Repeal the Charter of the South Improvement Company," and it reads as follows:

"Be it enacted . . . that the Act entitled 'An Act to Incorporate the South Improvement Company,' approved the sixth day of May, Anno Domini One Thousand Eight Hundred and Seventy-one, be and the same is hereby repealed."

The fact that it gives the name of the corporation correctly as the South Improvement Company, and refers to the date of its charter, which is more than a year later than that of the Southern Improvement Company, shows that there is no excuse whatever for confusing the two corporations.

So much for Dr. Gladden's competence as an investigator.

It having been shown in my former article that the company concerning which Mr. Rockefeller was being interrogated in the passage originally quoted by Dr. Gladden was not the South Improvement Company, as he had stated, but a totally different corporation, Dr. Gladden in his reply seeks to shift the issue by saying that while Mr. Rockefeller did answer truthfully the question which was asked him, he was bound to answer, not that question, but some other, which he might have imagined the examiner had intended to ask him. This is puerile. A witness on the stand is

bound to answer the question which he is asked, and he is not required, nor is he permitted, to assume that the examiner did not say what he meant.

Furthermore, perjury is a serious crime. No man commits crime without a motive, and no person with any proper sense of responsibility for his utterances would accuse another of it without first inquiring whether there was any apparent motive. There could have been no possible motive for Mr. Rockefeller to testify falsely with regard to his connection with the South Improvement Company; and if Dr. Gladden had pursued his inquiries a little further he would have seen that there was no desire on his part to do so. The South Improvement Company was investigated by a Committee of Congress in 1872, and on March 30th of that year Mr. William G. Warden, secretary of the company, gave a list of the stockholders, including the name of John D. Rockefeller. It had therefore been a matter of public record and public notoriety for sixteen years prior to the examination which Dr. Gladden speaks of that Mr. Rockefeller had been a stockholder of the South Improvement Company, and it would have been the height of folly for him to have denied his connection with it, even if there had been any object in his doing so. If Dr. Gladden will examine the testimony taken by the House of Representatives with relation to the Standard Oil Company in that same year, 1888, he will find, on page 387, that Mr. Rockefeller was then examined concerning the South Improvement Company, and testified with the utmost frankness with regard to his connection with it.

It thus is proved: First, that in the passage which formed the basis of Dr. Gladden's charge Mr. Rockefeller was not examined with regard to the South Improvement Company, but with regard to the Southern Improvement Company, and that his testimony was true;

Second, that the South Improvement Company and the Southern Improvement Company were totally different corporations;

Third, that Mr. Rockefeller could have had no possible motive for testifying that he was not connected with the

South Improvement Company, nor did he so testify; and,

Fourth, that when he was examined concerning the South Improvement Company he testified with perfect frankness with regard to his connection with it.

This certainly disposes of the charge of perjury.

This ridiculous falsehood appears in the books of Mr. Lloyd and Miss Tarbell, and has not heretofore been deemed worthy of notice. But when a man of Dr. Gladden's standing, as Moderator of the National Council of Congregational Churches, assumes the responsibility for it, and gives his hearers to understand that his statements are made only after a careful study of the records and official documents, it has seemed desirable to state the facts. The records which I have cited were just as accessible to Dr. Gladden as they were to me. The proof of the falsity of his accusation did not require any inside knowledge. It is

perfectly evident that he made this charge of a disgraceful crime against Mr. Rockefeller without any attempt whatever to investigate its truth. And now that his error has been pointed out, his struggles to avoid the necessity of a frank retraction and apology are, while very human, not in accord with the lofty standard of ethics to which he would hold his neighbor.

The Master said: "Judge not, that ye be not judged. For with what judgment ye judge, ye shall be judged; and with what measure ye mete, it shall be measured unto you." There is practical wisdom as well as divine sanction in those words. If one were disposed to judge Dr. Gladden with the same uncharitable judgment which he has applied to Mr. Rockefeller he might be tempted to use a style of expression of which we prefer to leave Dr. Gladden in the enjoyment of an undisputed monopoly.

NEW YORK CITY.

## A Song of Cotton Planting

BY SILAS X. FLOYD

It's de time fer plantin' cotton,  
An' fer breakin' up de groun',  
An' about de li'l fa'm-yahd  
Dere's a mighty turnin' 'roun'.  
Cou'se de fiel' is mighty rugged,  
An' de furrer's mighty long,  
But I keeps right on a-plowin'  
An' I sings a li'l song.

W'en de mule is sorter stubbo'n,  
An' begins to rair an' kick,  
Den I exahcises patience  
An' I strikes him nary lick.  
'T ain't no use to fuss an' holler—  
'T ain't no use to treat him wrong;  
So I does my bes' to coax him,  
An' I sings a li'l song.

W'en de cotton seeds is planted,  
An' is kivahed up all right,  
Den I'm happy ez a June-bug  
W'en de co'n's a-tasslin' bright;  
An' to show how I'm a-feelin',  
I jes' saunters all day long,  
Wid my hands down in my pockets,  
An' I sings a li'l song.

AUGUSTA, GA.

# The Present Aspect of the Panama Canal

BY WILLIAM H. BURR

[Professor Burr was one of the members of the first Isthmian Canal Commission and has just returned from the Isthmus. The following article, therefore, is authoritative and contains some fresh material nowhere else yet published in the United States.

EDITOR.]

**P**ROBABLY no single Federal public work in the United States has ever before attracted so much attention or excited such interest as the Panama Canal.

It is now but little more than a year since the Panama Canal Commission, charged with the duty of constructing the canal, was created, and but little more than ten months since the first American engineering parties set foot upon the Isthmus to begin those extended engineering surveys and examinations imperatively necessary to determine what should be constructed.

Members of the first Isthmian Canal Commission, which made the choice of the Panama route, stated emphatically before Congressional committees that at least one and one-half years should be devoted to the duty of preparation for the beginning of the work of construction. They maintained that plans should be adopted only after mature deliberation and that several months would be necessary to create the requisite operating organizations on the Isthmus before well considered construction could be begun. As a matter of fact much better results have been attained during the past ten or twelve months on the Isthmus than was thought possible by the former Commission.

The first engineering parties of the Commission created a year ago, consisting of a total of about one hundred and twenty-five engineers of all grades, were organized in Washington and New York, and reached the Isthmus during the period extending from the latter part of last May to the early part of July following. This engineer force was organized into five parties, each in charge of its own superior officer. The fields of this operation were set forth by the Commission in complete instructions as to the

ends which their operations were to serve, so as to cover practically the entire canal line between Colon and Panama. The last party sent out was charged with the duty of constructing a complete modern system of water supply for the City of Panama, as well as a system of sewers, the City of Panama never having had in all its history either a public water supply or a sewer system. The same party was also instructed to devise and construct a system of public water supply and a system of sewers for the City of Colon. Its scope of operations was also extended to include any water supply or sewer system which might be required for the smaller towns along the line of the canal. At the present time the population affected by this water supply and sewer work of the Commission is about 8,000 at Colon, about 22,000 at Panama, and perhaps 15,000 between those points.

In June of last year the Commission was most fortunate in securing the services of Mr. John F. Wallace, then general manager of the Illinois Central Railroad Company, as its chief engineer. He reached the Isthmus about the first of July and has since that time conducted the work of the Commission as its chief engineer in a most judicious and energetic manner. The active engineering work and all the work of construction since his assumption of the duties of his office has been prosecuted under his direct supervision. He is now also a member of the new Commission.

The title to the canal property was transferred to the United States by the new Panama Canal Company in the early part of May, 1904, about one year ago. It was necessary for the preservation of that company's concession that it should maintain active construction of work, and it fulfilled that provision of the con-

cessionary contract by a force engaged in excavation at the great Culebra Cut. This force consisted of about eight hundred men of all grades. When the property was taken over by the United States Government the Commission maintained this working force, but immediately on his arrival at Panama the Chief Engineer reorganized, increased and made it more effective and so systematized its accounts as to show clearly all the unit costs of the work performed.

The works of survey and investigation have been so comprehensive in their scope and so efficiently conducted that the resulting data, including those derived from the work of excavation in the Culebra Cut, secured up to the first of the current month (May) are sufficient to form a basis for the study of all the main features of the project.

Last November fourteen steam shovels of maximum capacity were ordered from builders in the United States, to be shipped in the shortest possible time. Seven of those shovels are now engaged in the work of excavation in the Culebra Cut. They are removing the material encountered in the Cut, including hard rock, at an average rate of over one thousand cubic yards per day per shovel. A number of the old French excavators were also repaired and put in far more efficient condition than ever heretofore, and they are also engaged in excavating earth and clay at the same location at nearly the same rates per machine as the steam shovels. The principal difference in the results of operation of the two types of machine arises from the fact that the steam shovels operate with practically equal efficiency in all grades of rock and earth, while the French excavators can only be satisfactorily operated in the softer materials of clay and earth.

The conduct of such a great public work requires a most extended and complete organization for the purchase of the infinite variety of plant, tools and materials required in its prosecution. A great department of supplies and materials was therefore promptly organized, both for the purchase and shipment of plant and material from this country and also for their receipt, proper care and efficient and prompt distribution on the Isthmus. This department requires a

force of ten to twelve hundred men, mostly rendering service on the Isthmus. Great numbers of buildings and warehouses must be erected, arriving cargo must be quickly unloaded, efficiently handled and distributed, so as to be available at all times at the shortest notice for the construction forces engaged along the line of the work.

All the forces organized at the Washington office of the Commission and on the Isthmus have been in effective working condition for several months. Those on the Isthmus have been engaged in the actual construction of the canal, in the creation and instalment of four machine shops in which contractor's cars and locomotives left by the French Company are being repaired and put in use at the rate of several hundred per month, in the construction of the water works for the cities of Panama and Colon and for intermediate places. The total of the Isthmian force on the first of April was nearly six thousand men.

Much has been written regarding the intensely unsanitary condition of not only the cities of Panama and Colon, but the entire canal zone, the latter being a territory ten miles wide, measuring five miles each way from the center line of the canal, and about forty-seven miles long, as that is the length of the canal between the tidewater lines on either side of the Isthmus. It has been recognized from the first that the initial work imperatively necessary before even the work of construction could safely be begun was the proper sanitation of this zone. Practically the first measure undertaken by the Commission, therefore, immediately upon its creation over a year ago was the organization of an effective sanitary force.

On its first visit to the Isthmus, in March, 1904, the Commission took with it three surgeons of the United States Army and Navy, eminent and experienced in the diseases of tropical climates, particularly those of the West Indies, Colonel Gorgas, U. S. A.; Major La Garde, U. S. A., and Captain Ross, U. S. N. Immediately subsequent to this preliminary inspection of the health conditions of the Isthmus the Commission appointed Colonel Gorgas Chief Sanitary Officer of all the sanitary work on the

Isthmus, with Captain Ross\* as Director of Hospitals and Major La Garde as Superintendent of the Ancon Hospital at Panama. The sanitary work of the Commission was organized under a number of heads, such as that of hospitals, including the Ancon Hospital at Panama, another large hospital at Colon and such smaller hospitals as might be required along the line of the canal; that of street cleaning and the complete sanitation of the cities of Panama and Colon; that of mosquito extermination, to which was devoted a large expert force, operating throughout the entire canal zone as well as in the two cities of Panama and Colon; that of health departments with health officers for Panama and Colon and two quarantine organizations of the highest efficiency, one for Panama and one for Colon.

This comprehensive sanitary force has been performing its duties with energy and the highest degree of efficiency for nearly a year. The general sanitary condition of the Isthmus of Panama has never before in all its history attained even the first approach toward its present advanced stage in healthfulness. Mosquito breeding places in the two terminal cities and along the entire line of the canal have been so far destroyed that the mosquitoes are greatly reduced in numbers and are now scarcely annoying as insects. There are still living in sheltered recesses of unsanitary occupied buildings some of those varieties which carry malaria and yellow fever bacilli, but they are being rapidly exterminated by thorough fumigation of all the buildings in the City of Panama. No yellow fever infection has been found in any other place on the Isthmus since the Commission assumed control. There have been but few cases, about one or two a week, during the past three months, and those have been sporadic; there has been no epidemic. There is every reason to believe that under the active and effective efforts made by the sanitary forces of the Commission it will be but a short time before yellow fever will be completely stamped out on the Isthmus of Panama, a place which has not heretofore been free from it since

the first occupation by the Spaniards. The total force engaged in the sanitary work of the Commission numbers nearly one thousand, including the hospital organization.

Summing up the whole situation, therefore, the present condition of the Panama Canal enterprise exhibits an active and well directed engineering organization, having already performed practically all the work of investigation and securing data required for the complete study and determination of all the main features of the project; a large force, amounting to nearly six thousand men, engaged in the actual work of construction and the care and distribution of the mass of plant and material required for the operations of construction now rapidly expanding; an admirably organized sanitary force, amounting to nearly one thousand men, which has already brought the health conditions of the Isthmus to an excellent sanitary stage, which also has organized and is conducting a great and highly efficient hospital service with a capacity of not less than eight hundred beds, effective health departments for the two terminal cities of the canal zone, and admirable quarantine organizations at the terminal ports. A new Commission has been created to conduct the work so efficiently begun, and there is every reason to believe that the construction of the interoceanic ship canal will be prosecuted with vigor and efficiency so that ships may be passing from one ocean to the other within a period of time not more than ten years, even if a sea level plan of canal should be adopted.

In addition to these matters bearing directly on the construction of the canal a complete government for the canal zone has been established, with the necessary enactment of laws and the creation of courts, police force and other governmental machinery.

That particular aspect of the Panama Canal project which now interests the public most is the question whether the United States Government should undertake the construction of a canal at sea level or whether a canal plan with locks should be adopted? It has been officially stated by the Secretary of War that the deliberation of the Commission on this and other main features of the project

\* Captain Ross has since resigned on account of ill health.

will be aided by a Board of Consulting Engineers, three of whom are to be nominated by the Governments of Great Britain, France and Germany. Whatever may be the final decision as to this particular question, it should be a matter of profound gratification to the American

people that the present prospect for the great project is most encouraging as to the judicious administration of the work of construction, as to the economy of its conduct and as to the relatively short period at which its completion may be confidently expected.

NEW YORK CITY.

## The Crisis in Hungary

BY FRANCIS KOSSUTH

[Francis Kossuth is the son of the famous Hungarian revolutionist who was so warmly welcomed in this country in 1851. He is the leader of "The Party of Independence," the Advanced Liberal party in Hungary.—EDITOR.]

HERE is a protracted crisis in Hungary which is not likely to end for some time. It may even lead to serious complications in this part of Europe.

The origin of the crisis was that the Government of Count Tisza violated a fundamental law of the country (laws of 1899, No. 30) and broke through the standing orders and rules of the House; and when the opposition put a deadlock in consequence of this to all parliamentary proceedings Tisza induced the King to order a new election, by which another law (1867, No. 10) was broken.

The elections gave a large majority to the opposition and increased especially the Party of Independence, with 170 members, of which the writer of these pages is the leader.

There was nothing abnormal in this, and the natural course would have been for the new majority to come to power.

At first the King (who is also Emperor of Austria) appeared to have no objection against this; but later it turned out that the majority would have to accept a program which does not agree with the platform upon which it had been elected.

The main difference consisted in this, that the new majority resolved upon interpreting an existing law (1867, No. 12, Art. 11) in a way which, out of fear of meeting with the opposition of the King,

had not been attempted since the present constitution exists.

This apprehension was felt by the party which has held power uninterruptedly since 1867 under different denominations and has been called for nearly thirty years (very improperly, too) the Liberal party.

But a change took place; the Liberal party became a minority (156 members), and the party which has for its aim to establish with constitutional means the independence of Hungary outnumbered the late majority, and other smaller parties also united with the Party of Independence so as to form a strong majority determined to conduct the affairs of the state in a national direction.

The law, the interpretation of which had been anti-national ever since 1867, gives to the King the hereditary right to be commander in chief of the Hungarian army and to command, organize and administrate this army according to his will.

No allusion is made in this law to the fact that the army is to be commanded and administrated in Hungarian. The fact is that the privilege was given to the *King of Hungary*, and as according to law the legal language of the Kingdom of Hungary is the Hungarian, the present majority affirms that such a prescription would have been not only superfluous but unnatural and uncon-

stitutional, as it would have admitted, as it were, the possibility that it would be otherwise.

The King, on the contrary, interpreted this law in another way, and in this he was never contradicted by the former majority; but the minority (the Party of Independence) always protested against this interpretation.

The King pretends to have the right to command and administrate the army in such a language as he pleases; and as the army of Austria (*i.e.*, the Austrian contingent of the common army) is commanded and administrated in German, for the sake of unity in the control and administration, German was thus used also in the Hungarian contingent, tho the troops never understood a word of what was thus spoken to them. As a consequence of this in the 43 per cent. of the whole army of Austria-Hungary such an idiotic state of affairs exists that men are persistently commanded and spoken to in a language they do not understand.

With ordinary commonsense one would think that it is better to speak to a man a language he can understand, but the Austrian war office is of a different opinion; it thinks that the unity of the army does not consist in the unity of the control, the unity of the weapons, of the drill, regulations, etc., but it consists in the language, whether this language be understood or not by the rank and file.

The consequence of this absurd notion is that since it was enforced the troops of Austria have been beaten in every battle they fought, and this naturally arises from the fact that there never is any community of feeling between the officers and their men, and the rank and file can have no confidence in their officers, who can never speak to their men.

The Austrian war office discovered some time ago this drawback, and an innovation was introduced in the instruction imparted by the non-commissioned officers. They have to use now the language spoken by the rank and file, but the principle that orders should be imparted by the officers in a language the

men do not understand is still kept up.

The present majority of the House affirms that now law prescribes in England that the English troops should be commanded in English or in France that they should be commanded in French, and yet the idea in itself would appear preposterous to an Englishman or to a Frenchman that the respective armies of the two states should be commanded in German or in Russian. No one can see why a thing that would be absurd in England and France should be right and natural in Hungary.

However, the King is inflexible on this subject. He will have it that the Hungarian troops should be spoken to hereafter, as they have been up to now, in a language they do not understand.

Such countries as have never been subjected to the danger of their nationality being assailed can hardly appreciate the importance attached to the principle of "*Noli me tangere*" applied to the national language. Some philosophers have said that "nations live in their language," an assertion which would be absolutely true if England and the United States of America did not make an exception to the rule; there is, however, a great truth in the fact that such nations as have to be on the *qui vive* to defend their liberty and their national existence are extremely sensitive on the point of the rights of their national language.

The present majority has always upheld the right of Hungary to claim the use of the Hungarian language in the army, which is kept up with Hungarian recruits and Hungarian money. It would now be a political immorality to give up this principle simply for the sake of coming to power.

We as a majority are determined not to commit the derogatory act of giving up the principles for which we fought while a minority. And as the King has been accustomed to have his own way in everything he is not likely to yield to the will of the Hungarian nation. A conflict between the Parliament and the Crown may be the consequence of this, a fact which it would be in the interest both of the nation and of the King to avoid.

BUDAPEST, HUNGARY.

# Insect Life Through a Microscope

BY DOCTOR A. DE GASPARIS

[Biologists are now living up to their name and are studying living beings in their homes instead of dead "specimens." For watching insects undisturbed a modification of the ordinary microscope is necessary, such as that invented by the Italian savant who here gives an account of his work.—EDITOR.]

**A** MIDST desolate rocks, under the burning rays of the sun, in the gloomy recesses of dark caverns, amidst blue ocean waves, everywhere life is developed; that beneficent spark which causes protoplasm to vibrate with hitherto unfelt palpitations infuses energy into organisms and fits them for the sad struggle for existence.

What infinitesimal cares, what unknown sufferings, agitate the delicate bodies of millions of creatures scarcely discernible by our eyes! What impassioned scenes pass before us entirely

without our knowledge! For many consecutive years I pursued researches into these things, seeing the necessity of an instrument which should promise the best means of solving many difficult problems, and after a series of experiments I reached the goal with the invention of the bioscope.

The bioscope is a microscope with a very long focus. While the different optical instruments hitherto constructed give a maximum focal distance of ten centimeters, the bioscope increases it to seventy centimeters, with a larger field

Dr. A. de Gasparis Using the Bioscope

and not less precision. The instrument offers the greatest facility for the study of the habits of minute animals in their natural environment and without preparation of any kind. In ordinary cases the magnifying power used is in the proportion of twelve diameters, equal to one hundred and forty-four times the surface. Continued practice in these researches during six years has shown me the utility of this magnifying, seeing that the motions of these minute creatures are for the most part performed with lightning rapidity, denoting enormous muscular power. When it is required to plunge the instrument into the sea or a lake it must first be placed in a tube closed below by a thin lamina of crystal with parallel surfaces, and then it will be easy to study the diverse animal species in their element, and to elucidate the varied development of life in its most recondite forms.

The bioscope may also render service to the clinical study of the human or-

ganism, of the eye, the larynx, and the nasal cavity, facilitating examinations of extreme delicacy and often of undeniable diagnostic value. Its use may be extended to all observations where magnifying is needful because of difficulty in approaching the object, or because of powerful electric discharges or radiation of heat, which might be dangerous with a short focus.

By means of this instrument one is enabled with the greatest facility to study the habits of minute arthropoda and other creatures, to observe their movements and measure them without any consciousness on their part. By it, too, we may observe the methods of fructification of the various flowers; in a word, we may watch the development of life in all its phases in a way undreamed of hitherto.

It opens to the naturalist regions of research yet unexplored—marvelous pictures yet unseen by human eye, of which no pencil has yet reproduced the

A Fly on the Window Sill

A Spider in Search of His Prey

brilliant coloring, refulgent with light and life. No pen can describe the scenes of beauty and of horror which now transport the fancy into fairyland and the golden region of dreams, and now to the fauna of vanished continents—to the titanic conflicts of monsters encased in triple armor. Tufts of mosses and hepaticæ, graceful and delicate; lichens of many forms and colors, sometimes red in the sunlight, sometimes ashen and grey or green and pink on the bark of trees, almost invisible to the naked eye, are revealed by the bioscope as minute forests, as little meadows of orange or emerald hue, as strange plants. Among these rove animals strange in form, some glittering in the sun, sheathed in cuirasses bestudded with rubies, diamonds and sapphires; others fierce of aspect, covered over with dusky hair. All these move and whirl together with the rapidity of lightning, displaying with their every movement their immense muscular power. They love, they combat, without respite, without pause. Rage, fury, joy and pleasure are expressed in their multi-form actions. We watch them and learn to understand them, and the secrets of the

recondite laws of life, blind, yet fixed, are unveiled to our gaze in their countless manifestations. A new world full of marvels is revealed to our astonished eyes; a series of cinematographic scenes is thrown on the eternal "films" of nature, ever changing, ever palpitating with life, now sad and sorrowful, now full of joy and love.

The bioscope shows what the microscope, perfectly adapted as it may be for its special uses, can never show—viz., life in its manifold appearances.

Let us observe more closely some of the scenes presented by the most frequently occurring organisms. Let us place a common fly (*Sarcophaga*) on the window sill and turn the bioscope upon it. Its great visual organs, composed of hundreds of little ruby-colored eyes, staring at us; its enormous body covered with rough hair, and its long, shaggy legs terminating in great claws form a startling revelation. From time to time it protrudes its great proboscis, damp and dripping with saliva, and with this highly sensitive organ, smooth as satin, it is continually proving and tasting the objects that come in its way.

Preparing for the Attack

The Capture of the Fly

Entrance to an Ant Hill

Now we shall examine one of the little hunter spiders of our windows (*Salticus*). His hairy body appears enormous and his anterior eyes, very large and motionless, emit strange gleams calculated to hypnotize his victims. His black feelers, with great bunches of white hair, have a convulsive motion and hide his immense, sharp, poison-bearing claws; his strong, hairy legs move slowly and regularly. Every now and then he raises his cephalo-thorax, rough with long hair, and looks around for a prey. When one comes within the scope of his vision, a scope from which there is no escape, he perceives it afar off, his eyes flash lightnings, his feelers are agitated, his whole being is excited. He begins slowly to advance cautiously and noiselessly, so as not to arouse suspicion in the victim. Then with a sudden spring he pounces upon him, holds him fast and strikes his poisonous claws into the body. Then he raises the creature quivering in death, an opaline liquid dripping from the wounds. This scene greatly impressed

me, the contraction of the victim's body showing the excessive anguish of this terrible death; then the slow paralysis of the limbs while the monster sucked in or absorbed his victim.

Let us now turn the instrument on an ant-hill. Here we see, as it were, a yawning cavern, its sides clothed with vegetation, recalling the fantastic ideas of the artists of the Celestial Empire. Here are enormous orange-colored cups, drinking glasses, urns bristling at the mouth with jagged teeth, leaves of the most delicate green, and in the heart of the cave a gigantic ant, intent on the performance of her toilet. Her body is covered with smooth, reddish-brown leather, shining in the sunlight which filters through the foliage. She stands upright on her slender hind legs, hard and tempered as steel, then bends forward by an abdominal contraction and with her front feet, used alternately, smooths the hair of her head and her long antennæ soiled with dust. With what grace her long tongue licks her legs, stroking them down between her opened mandibles! Nothing but a mirror is wanting to transform the scene into that of the boudoir of an elegant woman.

In another part a ferocious combat is raging between two warrior ants. They bend, they contract their bodies, they arch themselves convulsively in the mortal duel; in their blind fury the iron jaws of the one seek the vital parts of the other; then locked in a tremendous embrace, their antennæ crushed in the struggle, they roll together on the ground. Then they rise, obtaining a foothold by planting their claws in the gravel which had been scattered about

A Duel Between Two Ants of the Warrior Caste

by the force of the encounter. Their bodies gleam in the sunshine while their shadows are black on the ground.

Thus before the astonished gaze of

the observer pass joyful and sad pictures, and life goes on as among human races, titanic in comparison with these minute creatures.

ROME, ITALY.

## Wall Street's Estimate of Mr. Lawson

BY W. R. GIVENS

“WHAT is Mr. Lawson’s reputation in Wall Street?” I asked a well-known banker recently, not because I was curious to know his opinion, but the rather that I wished to see if I had properly gauged Wall Street opinion of the picturesque Boston character who seems now constantly to be in a state of eruption.

“Reputation?” the banker queried; “Lawson’s reputation?” Then, after a pause, slowly, “Why—he hasn’t any.”

This, however, is drawing the long

bow. It cannot be truly said to represent the real Wall Street view of Lawson. For that matter, properly to understand and appreciate this point of view it is necessary to divide the Street, like Gaul, into three parts, to wit: the derelicts, the rank and file, and the responsible banking interests, for each one of these groups looks at Mr. Lawson with a different eye, and in the metaphorical handling of him uses pitchforks or gloves or fumigating solutions, as the case may be.

To begin at the beginning: When Mr.

THOMAS W. LAWSON

Lawson began his campaign for the purification of the financial center of this newer world, for the elimination of all the ills to which financial flesh is heir or prone and for the extinction of the capitalists who have done so much to build up the great industries of the country—such men as Mr. J. P. Morgan, Mr. J. D. Rockefeller, Mr. James Stillman, Mr. H. H. Rogers, Mr. H. C. Frick and their co-workers and associates—all Wall Street laughed. It was too amusing. Mr. Lawson did not mean it, or, if he did mean it, he was taking himself too seriously. At once came to mind the Lawson fight over his cup defender yacht, which never defended, for reasons too well known to need repetition here; came reminders also of Mr. Lawson's rejection by several important social organizations in which were conspicuous certain of his old time business associates; came reports of losses incurred by Lawson through rapid-fire work on the part of some pool members who discovered that Mr. Lawson, one of the pool, was, in the vernacular, "leaking"—which, being interpreted, means that Mr. Lawson, tho pledged to hold his stock to the end of the pool's existence, was secretly but persistently dribbling it out. Hearing and remembering these things, Wall Street as a whole merely laughed when Mr. Lawson explained that he was rolling up his sleeves and was prepared to do or die. The predictions were many that Mr. Lawson's move was merely a bluff, that in due time he would call himself off or be called off for a consideration, and that his campaign was that, vulgarly speaking, of a "sorehead" who, successful financially, found himself as it were a social outcast among the men whom he had helped or who had helped him to riches. Not for an instant was it believed that he would make good, or make a show of making good, his promises or his threats to tell the truth, the whole truth and nothing but the truth about "The Crime of Amalgamated" and about, also, sundry other financial crimes. This was the first phase of the Wall Street idea.

Passing over several months, we come to the second phase. Mr. Lawson in his magazine articles was, in the opinion of some people, beginning to strike near

home. Without doubt he was telling some truths—how much or how little only those on the inside really knew. Beyond this Mr. Lawson stood revealed in a new light. Most people had regarded him, if they regarded him at all, as merely a man who had a great deal of money and who in the making of it had had neither time nor opportunity nor inclination to develop the intellectual and the finer side. And, behold! there appeared a new Lawson: a student of conditions, a close observer of things, a reader of character, a man with a philosophy of his own and, above all, a writer at once so forceful, so picturesque and so alluring that he fairly carried his readers with him. It was a revelation. The man was more than a financier. He was a literary artist; in the opinion of most people in Wall Street the best magazine writer of the day, plausible, powerful, amazingly original and always interesting. Thereupon the Wall Street attitude changed. From one of indifference and of ridicule it gave way to that of interest and curiosity and finally of wonder—wonder, after all, if Mr. Lawson wasn't really more in earnest than people had originally given him credit for; wonder if perchance he would tell "the truth, the whole truth and nothing but the truth." A few there were, to be sure, who still laughed at him and pooh-poohed his declared intention to "drive the rascals out," even tho he himself might go with them. But, generally, because of the interest excited by his articles and the newspaper notoriety that he had obtained, Mr. Lawson came to be regarded not so much as a thing of "shreds and patches," but rather as a man with a sound mind in a sound body and capable of doing much good—or much harm. Some there were who still predicted that he would be bought off, but the majority began to believe in him and to declare that whether he was genuine in his work of reformation at first, he had so worked himself into a frenzy that, egged on by the socialistic element, who never see good in Wall Street, he fully believed he had a mission in life to perform—the cleaning of the Wall Street houses. His articles were read word for word and discussed everywhere in the Street. When in his maga-

zine he, as it were, shook his head, Wall Street generally—the larger banking interests excepted—metaphorically shook its head. There were to be “doings,” that was certain. Unquestionably scores of people had lost money in copper; now they were to be shown how and why they did lose it; tho some skeptics then wondered and still wonder why, if the rich men are so powerful as Mr. Lawson declares they are, they did not prevent the so-called “rich man’s panic” of two years ago, when the wealthiest men in the country are known to have lost most heavily, despite their every effort to stay the tide swift flowing to lower prices.

Another lapse, and the Street was again beginning to get doubtful of Mr. Lawson. “In my next” he was always promising. It was the old Spanish cry, “Mañana, Mañana, Mañana”—“to-morrow, to-morrow and to-morrow.” Nothing that was not old or already known had been told but—“in my next.”

Nevertheless, Mr. Lawson was building better than the Street knew—building for himself. At the beginning of his crusade he had warned every man, woman and child in the country, every barber, bootblack and waitress who had had a “fling” in the McKinley boom market, to beware of the market and to get from under nor stand upon the order of getting from under. Yet after six months the market was up and up and yet up, until prices in many instances were the highest on record. Despite Mr. Lawson’s warnings and in the face of his predictions they had thus mounted, and for some weeks he had been marvelously still—for Mr. Lawson. It was the opinion of most banking interests in the Street that prices had gone too high; that a great deal of prosperity had been discounted and overdiscounted, and that it was a matter of but a brief time when the professionals who had jacked the market up would come to grief. These men made no effort to conceal their views. They had been selling stocks on a scale up and at the top were well cleared of their commitments. Mr. Lawson learned these things; his scouts and acolytes and emissaries were busy. With the exception of Mr. James R. Keene, he is perhaps the best market manipulator in the country. The time to smash prices

had come. But first Mr. Lawson sold quietly many thousands of shares of stock, quietly and with as little influence upon the market as possible. Then, like a bolt from the blue, he put out his “panic” advertisement in the newspapers, and with his followers, bona-fide brokers and bucket shop men as well, he fairly “avalanched” the market. Prices crumbled away, five, ten, twenty points, and Mr. Lawson and his friends made a killing. That was the panic of December last, now known as the Lawson panic. It was then that Wall Street became divided into three parts so far as this story is concerned, for there sprang up a new Wall Street class as a result of this panic—derelicts. These are the unfortunates who in the brief two days of that panic lost countless thousands, many of them their all. The panic came as out of a clear sky, and scores of those who lost aver that in those two days Mr. Lawson did more harm to innocent families throughout the land than could ever be offset by all the good that his magazine articles could produce, did they produce everything and a great deal more than he claims for them. And so sprang up this new class in the Street—men ruined by Lawson, who now damn him as seldom has individual ever been damned in the financial bailiwick.

Yet, on the other hand, this *coup* gave Mr. Lawson a great uplift and renewed prestige. Here was still another phase of his character. He was more than a student of conditions, he was more than a writer, he was more than a market manipulator. He was able to see and to seize the psychological moment. More, he was able to do; for had he not done what he had promised to do—shake the market to its very foundations? And so his fame spread and his followers grew. Likewise his predictions, among them that Amalgamated Copper—The Crime—was going to 30 or thereabouts. He did not say it in so many words, but the implication was that he would put it there.

On the morning of the day that that prediction was made Amalgamated and the rest of the market started up, with the result that soon Amalgamated was 60 points above Mr. Lawson’s predicted figure and the whole market was higher than ever. Again, therefore, a Wall

Street change. Time and time again Mr. Lawson came out with his warnings, predicting panic, but the market gave no heed. Slowly it came to be the opinion of speculators in the Street that as a market power Mr. Lawson was discredited, and that it were better for him did he stick to his articles, promise less and write more.

And then, horrible of horrors, came the Equitable scandal, and came also Mr. Lawson's "I told you so." The Boston man again mounted his pedestal and there, especially since the demoralized market of these last few weeks, the rank and file in the Street—by these I mean the "ticker fiends" and outside operators who, speculating on margin, hang over the ticker and sweat drops of blood when the market is going up against them—allow him to remain; indeed, believe that he should be there. They judge him not by details, but by large results. Did he not say that the insurance companies were being looted? Lo! the Equitable turmoil! Did he not say that the bankers of the country were speculating with the people's money? Lo! the defalcation of President Bigelow of the First National Bank of Milwaukee! Did he not say there would be a panic? Behold! prices at this writing are at the lowest point of the year. It matters not that his prediction in respect to Amalgamated has gone wrong and that the stock is now on a firmly established four per cent. basis, and, some people say, may receive greater returns yet; it matters not that a score or more of his other predictions have gone absolutely wrong. The speculators bulk him large. They look not upon the many special things gone awry, but upon the result generally. There has been panic, there has been life insurance scandal, there has been bank defalcation; ergo, Mr. Lawson, as a prophet, if indeed not a wizard, is to be reckoned with.

Unfortunately, this sort of admiration is ephemeral, and if Mr. Lawson courts it he had better make the most of it while he may, for those who bestow praise upon him are a fleeting people—in Wall Street to-day, gone to-morrow, empty of pocket and richer of experience. Those who remain will go to recruit the already large ranks of derelicts, and then they will be despisers of Mr. Lawson.

But tho these fly-by-night speculators may place Mr. Lawson on a pedestal, they cannot force the regular *habitués* of the Street, the brokers and the conservative bankers, to accept him at this lofty elevation. These men believe that Mr. Lawson should sell "ex-pedestal"—considerably ex. They still refuse to take him seriously and there is little likelihood that they ever will. They know the man. They know him, they say, putting it plainly, to be disgruntled; they know him, they declare, to be chafing because his social ambitions have not been realized; they know him as a violator of confidences and as a man who turns upon his friends so only that there be a dollar in it; they know him as a disseminator of false reports (as witness his recent dispatches) and as one who does not hesitate to assail character, whether with or without reason; they know him as a traitor to his own associates. Yet they know him also to be a man of unquestioned physical courage and of great natural ability, a man quick in action, firm and tenacious in purpose, ready with his pen and equally ready with his tongue, and for the nonce, explain it as they may, with his knife out for the biggest financial men in the country. They ridicule him, they despise him, but not for an instant do they affect to ignore his possibilities for harm. They regard him as a man with a grievance, a disturber and a nuisance—nothing more. They admit even that some of the things he has said are true, but they declare that for every statement of truth there are a dozen untruths, and that the man is as picturesque an exaggerator as he is a writer.

Briefly put, then, the Wall Street estimate of Lawson is this: The more recent of the financial outcasts, once prosperous, but now content to cling to the ragged edge of the Street in the hope of a turn for the better in their fortunes, damn him as the author and agent of their troubles. The transient speculators who stand by the ticker the livelong day incline strongly to him, aye, believe in him and are confident that he is a man with a mission, that he is telling much truth and that in the end he will carry the people with him in his fight against the "unrighteous system" of which he

was so long an integral part. The brokers and the bankers regard him as a disturber of the peace and as one who is actuated by selfish motives, by wounded pride and by a desire for revenge—all three. In their estimation he is at once the Benedict Arnold and the William Jennings Bryan of finance; the Arnold, because, if his own story be true, he is engaged in betraying his fellows; the Bryan, in that, demagogic-like, he is seeking to array the masses against the classes, endeavoring, in short, by creating distrust and uneasiness and unrest through the perversion of a half truth into a whole one, to destroy the financial structure of America's greatest and readiest market. His, they say, is the buccaneering kind; the "pea-under-the-shell" type, who, always smiling, ever gives you the worth of your money and

the right change back—"in the next." He is, you will be told if you care to ask, not within speaking distance of the Morgan, Rockefeller, Stillman, Frick class. They and their kind will be in Wall Street when he and his kind are nowhere. Mr. Keene is immeasurably above him; even Mr. Gates with all his faults is far superior to him. In short, he is a good man—bright, brainy, forceful, shrewd, energetic and courageous—gone wrong. As Kipling would say, there is "too much Ego in his Cosmos," and the Ego is not of the right kind. Such at least is Wall Street banking opinion.

Withal, it is agreed by all classes that Mr. Lawson is at once picturesque and amusing, a skillful market operator, a richer man as a result of his crusade, and last, but not least, a direct and pleasing contributor to the gayety of nations.

NEW YORK CITY.

## Lilac Blossoms

BY ANNETTE KOHN

A DAINTY little Fairy is peeping through the trees—  
She sailed upon a zephyr across the Southern seas;  
She's shod in velvet slippers, and dressed in lovely green,  
And where she steps, the brown earth puts on a wondrous sheen.

The lilacs come to greet her; with blue eyes shining wet  
As if with tears of gladness comes tender violet;  
The snowdrops in white garments, arbutus, dogwood, all  
The sweetest woodland children prepare a festival.

The brooks rush down the mountains with silver sprays of foam;  
The rivers run in welcome to bring her swiftly home;  
In every dell and valley some new attendant waits,  
Lifts the latch of every door and pours through ev'ry gate.

The birds come flocking round her, a gay-plumed happy throng,  
And bring new strains of music, for coronation song;  
While out upon the hillside the young lambs skip all day,  
And all the children love her and round about her play.

She holds a rainbow pencil, and paints anew the world;  
She draws aside the curtain, where Love asleep lies curled,  
In hearts of youths and maidens dear secrets whispering;  
Each year we build new altars in worship of the Spring.

NEW YORK CITY.

# A Man About Whom the World Should Know

BY BOOKER T. WASHINGTON

A GREAT deal has been said about colored people who are trying to help their own race; much has been stated about the Northern white people who have given service and money in the elevation of my race in the South, but one hears very little of a small class of Southern white men who are quietly and privately working to help forward the interests of the colored people and therefore the interests of both races. It is for this reason that I am calling the attention of my readers to Mr. R. O. Simpson, of Furman, Wilcox County, Alabama, a man about whom the world ought to know more.

Mr. Simpson was born at Belleville, Conecuh County, Alabama, December 1st, 1842, which means that he is now 63 years old. During his youth he received some education in an academy near his home, but, like many young Southern men of his time, Mr. Simpson left school at an early age to enter the Confederate Army. He joined the Second Alabama Cavalry, in which he served through the war. Returning penniless to his home at the close of the war, Mr. Simpson took charge of a plantation belonging to Mr. Dabney Palmer, his uncle. He has prospered as a business man and now owns several thousand

acres of the most valuable land in Alabama.

Wilcox County, to which Mr. Simpson came in 1861, is in the center of the "Black Belt" of the South, where the colored people outnumber the white people about four to one. There are in the immediate neighborhood of Mr. Simpson's house hundreds of colored people, many of whom were formerly owned by Mr. Simpson's family, and he, himself, also owned slaves inherited from his father. About twenty years ago the idea began to grow upon Mr. Simpson that he ought to use a portion of his wealth and time in helping to make more useful citizens of the colored people. How to begin, however, was a great puzzle to

R. O. SIMPSON

him. The way did not seem to open until a young colored man by the name of William J. Edwards, whose father lived on Mr. Simpson's plantation, began to work his way through a nearby Normal School. Mr. Simpson had loaned him several small sums of money, but with the lending the loan was forgotten. Some months afterward, much to the surprise of Mr. Simpson, young Edwards voluntarily appeared one day and repaid the loan. The act of this educated young negro impressed Mr. Simpson deeply. He began to reason that if

education would help one negro to the point where he would act in this manner, it would help others, and he began to talk with Edwards about starting a school upon his plantation. After some search a vacant and abandoned log cabin was found and a little school was opened with twenty-five pupils. The results of the work of this school founded in 1898 have been marvelous. The Snow Hill Institute has now 308 students, 55 of whom are boarders, and the students this year have come from five States. There are 22 teachers and helpers. The school owns 100 acres of land and two rather large, substantial buildings, a third one having been recently destroyed by fire. In addition to these two large buildings there are many smaller ones. The whole property is valued at \$35,000.

Mr. Simpson's part in this wonderful growth has been to me one of the most beautiful and inspiring object lessons that I have known in my experience in Southern education. Mr. Simpson is a doer and not a talker. I have never heard him make speeches over ten minutes in length. No man could watch over a member of his own family with more solicitude and tender care than does Mr. Simpson guard this school, and between him and Edwards there is complete faith.

Mr. Simpson has given 100 acres of land to the school, and many times when the treasury has been completely empty, when there has been no money to buy food or pay the teachers, even before an appeal could be made to him, he has from his private funds supplied the needs. Aside from what Mr. Simpson has done in the matter of gifts of land and funds for the erection of buildings, he contributes generously each year to the current expenses of the institution. From the first he has been President of the Board of Trustees. His son was Treasurer and is now Auditor, and his whole family is as deeply interested as Mr. Simpson is himself. The influence of Mr. Simpson has spread even further—many white people in that section of

Alabama who formerly had little faith in negro education now contribute toward the support of this school.

One white man, Mr. C. W. Hooper, of Selma, Ala., made a few weeks ago an unsolicited contribution of one hundred dollars.

The importance of the education of the colored children has impressed itself so deeply upon Mr. Simpson that he recently helped to found another school in another portion of the county. My readers may get some further idea of his deep interest when I say that both these schools are connected with Mr. Simpson's home by telephone. Within a few months he has placed his business in the hands of his sons in order that he might be able to devote his entire time to helping the people who need help. Mr. Simpson has not only interested himself in the material and educational improvement of the colored people, but has been equally outspoken and strong in his stand in favor of the colored man receiving justice in the courts and in favor of his being permitted to vote wherever he satisfies the demands of the State constitution.

Mr. Simpson's help and interest are not confined to the colored people. The white schools and churches share his interest and generosity, but, since the colored population is more numerous and more needy, he is especially interested in helping them.

Not many days pass that do not find this benefactor on the school grounds in consultation with Mr. Edwards. His days are now largely spent in going among the people, encouraging them to buy land and homes, to be frugal, to educate their children and to live Christian lives.

Mr. Simpson is, as I have said, a modest and unassuming man of few words, but having made up his mind that a certain course is right, and having clearly perceived his duty, he has pursued it steadfastly in spite of opposition or adverse criticism.

TUSKEGEE, ALA.

Portrait of Cervantes

## The Tercentenary of El Quixote

BY FATHER MIGUEL MIR

LIFE LIBRARIAN OF THE ACADEMY, MADRID, SPAIN

SIXTEEN hundred and five is a date that should be stamped in letters of gold on the annals of Spanish literature.

In this year the first part of "The Ingenious Knight, Don Quixote de la Mancha," was ushered into the world, written by Miguel Cervantes Saavedra, and published by Juan de Cuesta, of Madrid. With the second part, which appeared in 1616, it composed the work since universally known as "El Quixote."

The work, when completed, won for Spain a title to the highest glory and to literary immortality.

While it did not originate that form of fable and literary fiction commonly styled the "novel," it raised to the lofti-

est degree of perfection a class of literature which, by the very fact of its remarkable complexity and indefiniteness, lends itself admirably to the inspiration and luxuriant outpourings of geniuses, affording not only an opportunity for the display of the splendors and graces of inventive art, but also for the exhibition of those higher and more marvelous faculties with which the hand of God has adorned and enriched the human mind. "El Quixote" is not only the first of novels; it is, in the opinion of modern critics, the model and noblest exemplar of all novels. Miguel de Cervantes is the first of novelists.

Yes, all critics and historians of literature have come to a unanimous agreement that, whether we regard the texture

Don Quixote in the Ducal Palace. After a Painting by A. Gisbert

of the fable, the creation of the characters, the facile ease of the narrative, the careless simplicity and unstudied picturesqueness of the style, Miguel de Cervantes is not only exquisite and wonderful, but that up to the present hour no one has ever equaled him, or even approached him.

It is the judgment of Don Juan Valera that "El Quixote" is a novel which excels all other novels that were written before it and have been written since in beauty, grace, splendor and every other quality as much as the sun excels the planets and comets that sweep around it through the ether. "I have no doubt," he adds, "that, even as a book of entertainment, it is the best the world has ever seen." Opinions like that of Don Juan Valera might be recorded by the dozen.

But this literary and artistic perfection of the work of Cervantes is not the sole or even the principal quality which, in my judgment, gives it its chief value. "El Quixote" is not merely admirable in its structure and development, written with supreme art and with seemingly

careless grace; it is also a work of the highest educative and ethical value, and that, too, in the widest, loftiest and most universal significance of the words.

As "El Quixote" is pre-eminently a *human* work, it paints our nature such as it is in itself, without disguise, exaggeration or hypocrisy, teaching us, furthermore, what it should be, not by means of grandiloquent and superfine moralizing, but by plain and simple facts, by maxims and lessons that do not transcend the capacity of the most ignorant, and, especially, by noble examples of kindly manners, of rectitude and moral grandeur, liberality of sentiments and a frank revelation of those sympathetic qualities which exalt and enlarge the soul.

An atmosphere of moral sanity envelops the pages of this wonderful book. A breath of goodness, nobleness, spiritual serenity seems to be diffused from every page, and this breath must of necessity penetrate the soul of the reader, infusing it with placid, calm and tender affections, and working in it a sort of moral transformation. Whoever reads

"Don Quixote" not only diverts his mind with the thousand inventions and incidents of a marvelous story, not only feeds his imagination with the ineffable beauties of the narrative, the literary splendors of the style, the charm and sprightliness of a humor that is inimitable; he feeds his soul also with an aliment that is wholesome, beneficent and, in the highest degree, ethical. The soul of the reader of "El Quixote" cannot help being serene and tranquil. The intellect is always in a state of delight from the contemplation of such delectable pictures. The fancy is in a state of continuous ravishment; the heart rejoices and is content; the frequent smile wanders over the lips, and the eyes, perhaps, sometimes fill with tears; but this smile and these tears are always sweet, gentle and serene.

There is not in the whole of "El Quixote" a single odious or repulsive scene; there is not a single personage or situation from the sight of which the soul turns away in pain or disgust.

Even the most extravagant incidents and types, with all their absurdity and

grotesqueness, contain some element that renders them either sympathetic or pleasing. All the characters in this story have something about them that dignifies human nature.

The two persons who form the essential basis of the narrative, Don Quixote and Sancho, altho so different from each other, are equally human, sympathetic and lovable.

Don Quixote, in spite of his follies and eccentricities, is always the honorable and loyal gentleman, the high-minded cavalier, valiant and charitable, the good Christian and faithful Catholic. Sancho, in spite of his vulgar artifices and interested aims, is always honest Sancho, prudent Sancho, the Christian and sincere Sancho.

The intense and universal morality which is diffused through the entire work of "El Quixote" is undoubtedly one of the sublimest perfections that adorn it, and it is a perfection to which, perhaps, no small part of its popularity is due, at least among the general class of its readers.

But "El Quixote" has another per-

Don Quixote in the Hay Field Having Lunch

fection, or, rather, another series of perfections, which, altho possibly not intended by Cervantes, gives to this work a merit of a singularly striking character. It is not at all improbable that when Cer-

fatherland as it was in his own time, with the infinite variety of actions, customs, types and characters that were developed in it, with all the ideas and affections that agitated the minds and hearts of

Sancho Panza, Having Refused to Pay His Bill, is Tossed in a Blanket in the Inn Court. By Tresmoller. Engraved by Schley in 1745.

vantes was writing "El Quixote" he never thought of this; yet in the "Ingenuo Hidalgo" its author has given us the most perfect delineation and presentation of the state of the Spanish

Spaniards. He has drawn such an incomparable picture of his countrymen in all their greatness and all their littleness, in all their exaltation and all their abasement, with all their perfections and

Sancho Panza in Despair at the Loss of His Horse, Which Has Been Stolen from Him. After a Painting by Ch. Coypel in the Possession of Luke Vincent Lockwood. Copyright, 1905, by Luke Vincent Lockwood

all their defects, that it is not rash to make this assertion: If Heaven ordained that Spain should vanish from the orb of the earth, if all the monuments of our history disappeared, if all the ideas of Spain were effaced from the memory of mankind, provided that "Don Quixote" alone emerged safely from this universal cataclysm, there would be found in it alone sufficient material to enable the

mind to reconstruct the image of our country, the peculiarities of our character and the very soul of the Spanish nation; such is the variety of life unfolded in it, such is the faithfulness of its descriptions, whether moral or physical; such is the stupendous realism that penetrates, quickens and hightens the coloring of the entire work. Considered from this standpoint and under this aspect the

Cervantes and His Models. After a Painting by Angel Lizcano in the National Exposition of Fine Arts at Madrid in 1887

book of "El Quixote" is perhaps unique among the literatures of the world. This is the conception of it that has always been entertained by Spaniards, sometimes consciously, sometimes unconsciously.

In their idea this picture of real Spanish life, of men and things, of actions and characters, as it is unfolded in "El Quixote," is so faithful and exact that, for many of them, it cannot be separated from reality. In the belief of such persons the groundwork of the narrative, its incidents and casualties, its types and characters, especially Don Quixote and Sancho, are something real, something which actually existed, which is united with us by ties of family, which excites our sympathy, and is in such close contact with our very being that every

Spaniard guards, defends and respects it as his own peculiar possession.

It is this that gives "El Quixote" such unique and unparalleled popularity; consequently the work of Cervantes is pre-eminently patriotic and national.

For these reasons, then, there is no Spaniard who, on the occasion of the tercentenary celebration of the appearance of this work, sees in this solemnity merely the glorification of its famous author, Miguel de Cervantes de Saavedra, or solely the limitless glory that halos the "Ingenioso Hidalgo"; he sees also and above all something intimate, something which is the natural possession of all, something which belongs to the essence, the spirit, the soul of the Spanish fatherland.

MADRID, SPAIN

## A Woman Minister's Autobiography

[Whether women as a class are as fitted for the ministry as men we doubt, but certainly this woman was a success, and her methods are those that could be more widely copied by her brother ministers with great profit to themselves. For obvious reasons she prefers not to sign her name.—EDITOR.]

MY father was a minister. I used to think the office a kind of spiritual necessity in the family, for in my childhood my mother counted fourteen of her kindred who were preachers at home or missionaries abroad besides her husband, and others of a later generation have adopted the profession. Even the daughter of Scotch Presbyterians might "study theology" from her father's books to her heart's content, tho no one dreamed she would ever aspire to proclaim the doctrines of her church from a pulpit platform. But they used to say to me, "If you were your father's son you would surely be a preacher." There were two boys that were allowed to play with us girls. I seem to have planned the games, for they were all church services of some kind, including weddings, christenings and funerals. Cousin Will sang like a nightingale in the make-believe choirs, and would marry any of the girls whom I suggested to him as a bride, while Har-

vey made a first-class undertaker and a rather good sexton; but neither of them would ever be preacher, and not a girl among the six but myself had the slightest call to hold that sacred office. When I grew older I chose teaching as a profession, not that I had any special fitness for the work, but because it was the most "lady-like" calling within my reach. The W. C. T. U. and Woman's Mission Boards were becoming frequent and effective about this time, and I gradually came into demand as a propagandist of their ideas. I shocked some friends, amused others, and finally interested all by "talking" on these occasions rather than reading essays. I think I was not conscious of much adverse criticism at the time, for I was so busy with those who really received my message, and this has saved me from many a heartache during my career. I would not know till after a victory, and then I did not mind. At last these little addresses became so frequent that ladies in other

places began asking for them, and some societies thought them worth paying money for. Finally Miss Frances Willard, our National and World's President of the W. C. T. U., said in her sweet and gracious way that I could be of "great use" to them, and so arranged plans by which I gave my entire time to organizing and lecturing at home, and then abroad in the British and Dutch States of South Africa. On returning to America I was called to lecture in Manitoba and in some of the Northwestern States. While in Minnesota I met a woman who was ordained pastor of a Congregational church. I visited her home and her parish and was charmed with the opportunities she possessed. I thought an angel might envy her the good she could exert over the character and home life of her people. More than ever was I concerned with the thought of the special fitness of women for certain lines of pastoral work. I learned also that in this fair-minded cheery West two or three other women were engaged in this calling, and it was with great pleasure that I accepted soon a call to take charge "for six months" of a little church in which I had held a few meetings. My pastor and the board of eight elders in giving me my church letter approved of my choice of work, but expressed regret that I must go "out of my own communion to get it," because the presbyteries yet decide that "women are not called to preach."

Now this little church had the reputation of being a difficult one. In thirteen years it had known a dozen pulpit supplies, and had "vacancies" extending over periods of months. The senior deacon said frankly they had "tried old men and young men, students and seminary-trained men, and a few possessed of some native wit and not much schooling, and they now proposed to try a woman." The council of men and women, pastors and laymen of some twenty-five churches of "the twin cities" were not troubled by the scruples of the presbyteries. They had been invited by my people to confer ordination and installation if an examination should show my fitness, and a few weeks' mutual acquaintance between the people and me seemed to have wrought wonders, for there was

no intimation at this time of "a six months' trial." I remained at W—— for five years. I was for some time the only resident pastor of six churches on the lake shore, so that almost all funerals, marriages and christenings were in my charge. "The Preacher Lady" seemed to be able to unite all factions and all faiths. Roman Catholic and Lutheran parents brought their little children to me for baptism, while the laboring men and women of the village, the farmers' families, and the wealthy people who had built handsome cottages on the bay, which they occupied for only a few months of the year, came to church harmoniously.

It was rather a surprise to our folks when I began hiring the best trap and horse in the village the first summer I was with them to make morning calls on the "cottagers." None of their former ministers had been on terms of social equality with these people, and never called unless to ask for contributions. It seemed a sort of intuition. Of course most of them were my social equals, and I had to find out in my woman's way who among them would really help me and my people in our best real life, and whom we could help. The ladies of the lake not only returned my calls, sometimes bringing down their husbands and city visitors, but they contributed liberally—from our standpoint—when we repaired and beautified our house of worship, helped pay off the parsonage debt and founded a reading room. I never asked them for contributions. I found that many of the village women had a very small range of experience and ideals. I reorganized the Ladies' Aid Society and became president of it, so that I could come into confidential touch with them. I studied new recipes and suggested new dishes. I wrought on fancy work, because it is so much easier for folks to follow practice than precept. I do not know if it is a rare thing between pastor and people, but these women began to feel, I think, to a remarkable degree, that I stood for them in many ways. They became interested in the accounts I gave of people and places that I knew in connection with the activities of the Church at large. They always wanted me to go to district and State associations; to "look well" and to "make a

good impression." I began to succeed in coaxing more of them to attend such gatherings, and our own church activities grew in power and interest.

There were fifty-five churches in our district. At my first meeting of the association, which all ministers and some laymen are supposed to attend, I was elected secretary—the first time a woman ever occupied that position, I think. It was not given me so much because the brethren considered it an honor to me as because it entails a good deal of hard work some of them were glad to escape. Three men were named before me, one declining on the pretext that he could not write legibly, and all the others making some halting excuse no better than that one. But they all seemed immensely pleased and relieved when I was at last safely elected. I always tried to avoid calling notice to any distinction in sex in my work in any line, but every one else was not so careful, and sometimes embarrassing things happened. At a large State meeting of Women's Missionary Societies, held in a prominent city church, the two other women pastors of the State in our denomination were present, and it chanced, or was purposely planned, that we were seated together at lunch. As soon as this was noticed people began to say quite loudly: "Oh, just see the three preacher ladies eating together," the waiters stood and stared, the people in the kitchen peeped, and mothers even called their children in to look at three very ordinary looking ladies eating their dinner—it is to be hoped very much in the fashion of other folks. Why should it appear such a strange thing for three little women to be trying to do a piece of work for humanity that the men of the Church had neglected, or failed in doing? As for the ministers of my Church, and those of other faiths, they have been almost without exception, when they have once fully understood my position professionally, frankly cordial and brotherly. I have noticed that the better they do their own work, and the finer the position they themselves hold, the more ready they seem to appreciate my efforts. The people who hold longest to prejudice and preconceived opposition are the ignorant, specially the undisciplined and raw, and

those who are not growing old sweetly. Soon after I went to W—— a young man made some critical remarks about "a woman pastor," and openly set forth a plan he had to fasten a live mouse in the pulpit stand in such a way that it would escape when I moved the hymn book to open the Bible. The trick failed; perhaps the mouse got away too soon. They told me about it afterward, and I was devoutly thankful the thing wasn't there to jump at me, for I never have been able to avoid screaming when confronted by a live mouse. Yet I cannot understand why this weakness should seriously impair the usefulness of a woman who has it in her heart to minister lovingly toward the spiritual growth of live children, or to comfort the bereaved friends of dead ones. This lad afterward became one of my faithful helpers. We took up Sunday afternoon service for a poverty-stricken little church three or four miles around the bay, and in the coldest or hottest or muddiest of the weather the boy would bring his own horse and drive me over, thus saving me from a care that "comes more easily to a man than to a woman." He confessed to a sister, who was a warm personal friend of mine, that I not only could preach, but that I was brave, and set an excellent example to the men preachers, "who cut the service when it rains, and complain about the long ride."

Some people will joke about even the most serious things, and then get paid up for it possibly. There was a facetious widower in my congregation. The day of my ordination the last act of my generous membership was to serve a nice lunch on a beautiful lawn near the church before the visitors took train or boat for homes. As I talked to some of the young people after the friends had gone, thanking them for their valuable contribution to the day's success, this gentleman came up, saying: "Miss ——, what would you say to me if I should ask you to marry me now?" Without hesitation I answered: "I should say I am happy to be eligible to perform that ceremony. Who is the lady, Brother Z——?" He said the "joke" was on him and went away laughing.

Some months later the same gentleman came to me with a declaration that some-

how recalled the foregoing incident, but my answer did not fit any better than the first one did apparently, tho he did not go away laughing, and did not say "the joke is on me." I never married him, for altho he married a wealthy widow later on, he did not ask me to "perform the ceremony."

I was often reminded of Dr. Andrew Murray's wise saying: "The reward of work is more work." I exchanged pulpits frequently with men of large and influential charges, and particularly did this request come when they wanted a temperance or missionary sermon preached. I was counted successful along these lines and with young people. They seem to be the first in the ministry to be regarded as "essentially womanly." At first we had a few people who thought it most "improper" for a woman to officiate at the Lord's Supper. With us this was a very simple service, yet all that it implied—remembrance of not only what He was, but what He is. We had full congregations on these occasions, and finally some who seldom attended church spoke of being specially blessed by joining us in the Holy Communion. I speak of this because I have had the same testimony in regard to this ordinance as administered by other women pastors. It is associated with a remark made to me by a man who at this time was pastor of one of the leading churches in Minneapolis: "The world will not find the Church cold nor losing its power when we have freely and generously opened the doors of its every office to the most moral and spiritual two-thirds of its membership, really welcoming them, and not merely tolerating them because in the light of God's Word we dare not refuse their ministrations."

When I was utterly perplexed and wearied with the varied gamut of human nature, and all efforts to lift the burdens of the needy masses and the unhappy classes seemed to fail, I could always go to the lake shore, and turning from the ugly, huddled buildings of the village, and the more pretentious "cottages" of the summer people, would throw back my shoulders, breathe deeply, and gaze upon God's building. The cloudy water tipped with silver

flecks sang a thousand songs in summer. The expanse of diamond-studded snow that in winter covered the solid ice, making a new highway, was painted with a hundred different pictures daily by the Hand Divine. It was His gift to the people of the region that we might keep faith with Him and with each other. But in the last analysis even if a woman should do a given work far better than a man she is very apt to succumb in time to things social, as they are and not as they ought to be. We had some new people come into our place. A few of them brought church letters from denominations that do not have the light on God's word as the Congregationalists have it. They were not even "tolerant" concerning the ordination and ministration of women in the Church. One man whose child had been converted by my ministry a little while before, refused to bring a letter or permit his wife to do so. He said a woman should do religious work as a missionary, "not for pay." "To give this little woman six hundred dollars a year and three rooms in the parsonage rent free," was a thing unheard of. "They could get a man for that." The senior deacon, always loyal, always fearless, always fair, held for the administration. They had paid every man preacher eight hundred, "and the whole parsonage, if he wanted it." "And we never had any better work done, either." But not even the senior deacon nor the devout and faithful Mrs. Deacons were able to "corral" the tongue of the modern Jezebel. "The Preacher Lady" was on "intimate terms" with people of doubtful reputation. It was true. I had even attended two dances. Once I had spent most of the hours of a long, weary, to me utterly disgusting night in the untidy old hall where the dances and other public functions were held. I knew of threats that menaced the character of some of our young people. I knew my presence had prevented the attendance of some and checked the conduct of others. I knew there was not a man, woman or child in the village with the grace of God in his heart that did not trust me. I knew at that great day some lives would stand before the Judge cleaner because I had

chosen that form of service. I also knew that going home in the early dawn of a glorious spring day upon this last occasion of defeating the wiles of the Evil One I had asked the Heavenly Father if I might not be spared that sort of service again forever more. All these attacks could have been overcome. It all grew out of a form of jealousy because a woman could succeed, had succeeded, where others had failed. A brave woman would have found the fight and victory an easy one. I should have held the ground a year before. But there comes a time when the cry of the human heart for the presence, or at least the nearness, of kindred and first familiar friends grows too strong. There was another call, too, to a church farther East, nearer "home." A majority of the congregation in W—— were loath to accept a resignation, and afterward wished to reconsider. I had my father only a few brief years of my life, but one thing I had learned of him, "when you know you are right do not let any one persuade you from your course."

One little girl regretted my going most because they were to have "a man preacher," and she thought that would "be horrid."

My experience for the next fifteen months in a city of sixteen thousand people, most of whom are foreign born, over a Welsh and American membership of fifty souls, planted as the only Prot-

estant English-speaking religious body in a population of five thousand in "the factory district over the river," our nearness to the ugliest and wickedest city on the continent, which certainly helped on our demoralization; the small homes that could not open wide enough for the pastor's reception as an inmate; the horrors of a boarding house filled with men of low character and habits; the effort to "keep house" in a little flat, which with all my other duties led to an almost fatal illness—a simple mental review of all this leaves me nearly breathless even now. Yet there were many things it is well to remember. It was not a lost battle. While I have sought not to emphasize a difference in sex, a truly thoughtful and helpful officary and a careful choice of personal friends may save one from those acts that are counted "masculine," and certainly there is no need of performing one's professional duties in "a mannish way." In my seven years as pastor, both at W—— and at H——, I was never expected to go out alone nights. I never made myself troublesome by asking company, and if duty called me unexpectedly I went without fear. But I saw to it that the girls of my congregation did not go about unprotected; I know a woman's right to be shielded in the dark from possible molestation, and to certain other courtesies which I never claimed for myself, but which have usually been granted me.

# Literature

## A Universal History

THE natural interest in history has been greatly increased in recent years by the elevation of historical investigation into a science and by the discovery of a wealth of new material, chiefly from under the soil. On the one hand history has become something more and better than the mere reciting of traditional stories; on the other hand, the sources of study are so many that one needs almost unlimited space to record the his-

tory of a single people. No small degree of courage is required, therefore, for one who essays to issue a history of all nations.

The seven volumes\* before us are a first and considerable installment of such a work. Ambitious as the project is, it is apparent that the undertaking has not been ventured without reckoning the

\* A HISTORY OF ALL NATIONS, FROM THE EARLIEST TIMES. *Being a Universal Historical Library, by Distinguished Scholars, in Twenty-four Volumes.* Philadelphia and New York: Lea Brothers & Company. Vols. I-VII.

Monument of Naram-Sin, King of Agade, with Superimposed Inscription, "Sutrak-Nakhunte, the King of Elam." From "History of All Nations." Philadelphia: Lea Brothers & Co.

cost. With more than one-fourth of the complete work at hand, it is easy to forecast a successful termination to the scheme and a real contribution to historical knowledge.

As the editor says, no one person is competent to write such a history as this. We live in a day of specialization; a student is most content with a large knowledge of a limited period or of a single nation. Therefore many able scholars have been called upon to treat the subjects which they have particularly mastered. Eighteen well-known specialists, mostly professors in American or German universities, have contributed to this work, while the whole appears to be under the editorial supervision of Dr. John Henry Wright, of Harvard.

The American editor has had a further advantage. This is not a new work altogether, but a translation of a German *Allgemeine Weltgeschichte*. It is more, however, than a mere translation. In several places the original has been supplemented or supplanted, as by the admirable sketch of Prehistoric Egypt, by Mrs. Stevenson, and the important contributions by Professors P. H. Steenstra, Morris Jastrow, Jr., A. V. Williams Jackson and Frederick Wells Williams.

This work is not a mere attempt to present the story of the brilliant exploits of the nations, but rather to portray the life of the people. Therefore social, literary and religious conditions find a place along with the usual political phenomena. Modern discoveries have made this newer treatment possible. Archeology has been laid under contribution wherever it had a story to tell. Contemporary monuments and records have been unearthed, making it possible to portray accurately and fully the common life of the times.

The work is profusely illustrated, not with useless fancy pictures, but with cuts of objects of real historic interest, such as coins, monuments, buildings, costumes, household utensils and objects of art. Some of the plates in colors giving *fac-similes* of manuscripts are very good, but most of the illustrations are old-fashioned wood cuts, doubly inaccurate since they have passed through the hands of both draftsman and engraver. It is inexcusable to use these in cases where

recent photographs can be procured.

As far as it is possible for a single reviewer to judge of this work it seems to be scholarly and accurate and may be commended to the reader as trustworthy. The method of treatment, however desirable it may have been to avoid repetition, is open to just criticism. For it is difficult, if not impossible, to get from this book a consecutive history of a particular nation. For example, the excellent contribution to the history of Israel by Dr. Steenstra carries the history down to the ninth century B. C., but after that the story of this nation is found only included in that of other peoples with whom the Hebrews were in close relations. Doubtless the general index, to which a whole volume is to be given, will partly remedy this defect. In all fairness it should be added that this feature is characteristic of the treatment of the Oriental peoples rather than of Greece and Rome.

Another noticeable defect is the absence of references. The editor refers to the innumerable monographs which have been published, and for most students these works are not easily accessible; but surely some who read these volumes would be glad of guidance to other books. It is a prevalent fashion to overload scientific works with references, to the confusion and dismay of the reader; but in this respect an excess is preferable to a dearth.

Just praise is due the editor for the analytical contents at the end of each volume and for the very full chronological tables at the end of Volume V. The volumes are large and handsome in printing and binding, but there is no apparent reason for making them so heavy (4 pounds 5 ounces), for half-tone illustrations are rarely used.

### English Men of Letters

THE recent additions made by the Macmillan Company to their new series of *English Men of Letters*\* are worthy of their place in this standard set of

\* ENGLISH MEN OF LETTERS. SYDNEY SMITH, by George W. E. Russell; ADAM SMITH, by Francis W. Hirst; THOMAS MOORE, by Stephen Gwynn; WILLIAM HICKLING PRESCOTT, by Harry Thurston Peck; WILLIAM CULLEN BRYANT, by William Aspinwall Bradley. New York: The Macmillan Company. 75 cents.

literary biographies. They include the two Smiths, Thomas Moore and our own Prescott and Bryant.

*Adam Smith* belongs to the category of writers whose names are the synonyms of their books—it is generally one book—and whose books are the synonyms of social, intellectual or political movements. Of such men it is not easy to write without provoking dissent; yet that was the difficult task before Mr. Francis W. Hirst, when he undertook to write of Adam Smith, not as one of the greatest economists and the protagonist of free trade, but as a man of letters. There was the danger from the Scylla of controversy as well as from the Charybdis of commonplace and flaccidity. Mr. Hirst has successfully overcome this double difficulty by throwing the weight of the exposition from the book, the "Health of Nations," to the man Adam Smith, the whole man as he lived and moved from the days of his boyhood and his apprenticeship at the universities of Glasgow and Oxford, to the days of his professorship at Glasgow and the composition of the "Theory of Moral Sentiments," his tour in France and association with the great leaders of science, thought and politics in that country, the return to England and the composition of the immortal work with which the name of Adam Smith will forever be inseparably associated, down to the last days of retirement at Edinburgh. And all this is directly connected with the circumstances, men and events of the time.

The author does well to lay stress on Smith's doctrine of sympathy or fellow-feeling as a primary instinct of man and the basis of his moral sentiments. That there is only an apparent, but no real discrepancy between this doctrine and the assumption, in the "Health of Nations," of individual self-interest as the dominant motive of man in his present-day economic or business relations, Buckle has pointed out long ago. But it is, perhaps, not so well known that the doctrine of sympathy, tho in a greatly modified and expanded form, is coming to be of ever greater significance in the explanation of social phenomena, particularly those of a primitive order.

There are a few comments we would

like to make, but the space at our disposal forbids. We shall, therefore, only mention two points: On page 81 the assumption is made that Marx looked forward to a state of society in which every one would enjoy the "whole fruit of his own labor." In his famous criticism of the Gotha program of the German Socialist Party, Marx expressly and at considerable length repudiates this notion. On page 83 reference is made to Smith's "queer idea" that the division of labor is the result of the propensity inherent in human nature to truck, barter and exchange. Was this idea really "queer" in Adam Smith's time, and would it not have been well to explain how so great a thinker came to hold as reasonable an idea that seems so "queer" to us?

Mr. Stephen Gwynn's *Thomas Moore* is a pleasing account of an extremely pleasing and lovable personality. It is pointed out that Moore does not nowadays occupy so high a position as had been assigned to him in his own day, when his vogue rivaled that of Scott and Byron, and greatly eclipsed that of Shelley and Wordsworth. Such are the mutations of taste! The men of the present age demand stronger spiritual fare than Moore can give them. The careful exclusion from his verse of any touches of realism, of which a characteristic example is given on page 31, and the carefully wrought, smooth and florid style, are alike distasteful to a generation that has become accustomed to a frank and even brutal exposure of human life and to a correspondingly direct, bald and even rugged style. It is noted, however, that Byron, who was Moore's direct antithesis in both of these respects, had a high opinion of Moore's poetical gifts and that many of Moore's contemporaries ascribed his weaknesses not to a lack of power, but to a lack of confidence in his power. For our own part we believe that even now, and largely owing to his defects, if defects they be, Moore's "Irish Melodies" and "Lalla Rookh" constitute the best introduction for youthful persons to the temple of English poetry. In his own day, and especially in his later years, Moore was not only a poet, but also a politician. And, indeed, even aside from his biographical

and controversial work, were not the "Irish Melodies" a political act of high import? As such it was recognized by his countrymen, who offered him a seat in Parliament from Limerick. Fortunately for him he declined the honor, for he was in agreement neither with Whigs nor Tories, did not agree at all points with O'Connell's party and would have felt quite out of place in Parliament.

For the more intimate relations of Moore's life we refer the reader to this delightful little volume.

Had *Sydney Smith* possessed £1,000 in 1792, when he was about to leave Oxford, it is almost a certainty that he would have gone to the Inns of Court and achieved as much fame as could possibly have accrued to a lawyer of Whig opinions in the days when Pitt and the Tories were in power and none but Tory lawyers were elevated to the Bench. Forty years later, under the conditions which confronted Sydney Smith, he might have gone into journalism, and become a Barnes or a Delane. But in 1792 Sydney Smith could not wait in the Temple or Gray's Inn until the attorneys found him out, and for a generation to come daily journalism was, according to Sir Walter Scott in his counsel to Lockhart, a calling in which a gentleman could not engage. Sydney Smith was compelled to make a start somewhere, and so he entered the Church, regarding holy orders, as Mr. G. W. E. Russell states, "frankly as a profession." This means that he did not persuade himself that he had any call to service in the Church, but was ordained deacon in the same spirit as in those times a young middle-class Englishman might have gone into the grocery business or apprenticed himself to a Manchester warehouseman.

Mr. Russell, as a Whig by birth, atmosphere and tradition; as the foremost exponent of the old Whiggism in the English daily press to-day, and as perhaps the best informed writer on all that concerns the history and traditions of the Established Church, now in Fleet Street, was eminently well-equipped to write of Sydney Smith. But zealous Churchman as Mr. Russell is, he has not taken Sydney Smith's long connection with the Church too seriously; and in sketch-

ing backgrounds for Sydney Smith as a preacher at proprietary chapels in London and Edinburgh, as an absentee from Foston, and as an ecclesiastical dignitary at Bristol and St. Paul's, he presents some sharply defined and telling pictures of the internal economy of the Established Church in the dark days of Church life, which intervened between the Restoration and the accession of Queen Victoria. Mr. Russell has also drawn very liberally on Sydney Smith's writings; so liberally that the pages of extracts which he quotes will abundantly serve all but special students of literary style or of the political and literary history of England from the French Revolution to the beginning of the reign of Queen Victoria.

*Prescott* as a historian is somewhat out of fashion for two reasons: our historians do not now pay so much attention to the personal and the spectacular elements and they have shown us quite a different picture of Aztec "civilization" than that presented in his descriptions of the Court of Montezuma. But for his splendid pen pictures of battle and pageant he will always be admired.

Professor Peck writes of *Prescott* pleasantly and in his usual popular vein. His summary judgment of *Prescott's* rank as a historian is as follows:

"Without the humor of Irving, or the fire of Motley, or the intimate touch of Parkman, he is superior to all three in poise and judgment and distinction, . . . placing him at the head of all American historians."

The sketch of *Bryant* is more critical than sympathetic, and it renders scant justice to the fine translations of Homer. His choice of iambic pentameter blank verse was in accordance with the genius of the English language—the use of a hybrid hexameter would have been a mistake. Perhaps Swinburne could have accomplished the feat, but we fear Homer would have been smothered in luscious epithet and "the spirit of the Greek" would have fared worse than in *Bryant's* restrained version. Mr. Bradley says: "*Bryant* is no Wordsworth"; if he did not reach the heights of Wordsworth's genius, he also escaped the dreary plains of his platitude. No less a critic than Matthew Arnold pronounced "*The Waterfowl*" to be the

best short poem in the English language. The story of the frail and bookish boy, the young lawyer, poet and editor is told clearly and well, tho it lacks the sympathetic note of ideal biography.

### Bible Commentaries

PRESIDENT HARPER'S work on Amos and Hosea<sup>1</sup> will unquestionably take its place at once as the best critical exposition of those two prophets that has yet appeared in English. It is painstaking, accurate and thorough in scholarship, fair and sound in judgment, full and impartial in the statement of contrary opinion, and mindful of its text, not as a series of exegetical puzzles, but as a document in the history of humanity and humanity's two noblest religions. It fulfils a much larger purpose than the primary one of a commentary, which is to explain the text; it seeks to show the position of these particular prophets in the development of the religion of Israel, and is therefore practically a history of the Hebrew faith from its beginnings to the close of Hosea's work, about 735 B. C. It may be questioned whether so much should be included in the scope of such a commentary, and whether 605 pages are really necessary to make clear the essential message of 23 chapters of the Bible, less than 14 pages as printed in the Revised Version. One would look more naturally to the commentaries on the earlier historical books for discussion of the place of Elijah and Elijah in the development of Hebrew religion, and to works on the Hexateuch for an estimate of the religious contribution and significance of the Decalogs, the Book of the Covenant, and the Judæan and Ephraimitic Narratives. President Harper is 100 pages along before he reaches Amos. Yet undeniably a clear opinion must be had of the religion implied in these earlier documents before the work of the first literary prophets can be appreciated, and it is perhaps ungenerous to complain of receiving more than one has a right to expect.

It is difficult to refrain from discussion of the story of the growth and

formation of Israel's faith, as told by President Harper in clear, bold strokes and with frequent original suggestion. But even to outline his sketch of how the Hebrews came to their worthy faith would transcend the limits of a review. It can only be said that in general President Harper represents the views of modern critical scholarship. In minor matters he touches upon controverted points on nearly every page, and his views on many particular passages will be questioned. In the matter of the distinctively new in Amos it is doubtful if President Harper's exposition will stand. He says that the new in Amos was

"that spirit of observation and recognition of general law, of philosophical insight and reasoning, which became the so-called wisdom-spirit when nationalism had passed away and the doctrine of individualism was beginning to assert itself. Amos is almost as much sage as he is prophet." (p. civ.)

But this is to blur the image of Amos which stands out from every paragraph of his genuine utterance—the image of a man of ethical fervor, of passion for righteousness, the Hebrew prophet *par excellence*. In effort not to credit Amos with anything which his predecessors had seen or taught it must not be forgotten that the herdman of Tekoa *felt* some very old things with an intensity the world had not known before, and that in the intensity of his feeling, in the fusion of ethical and religious conviction in the white-heat earnestness of his soul, is his essential message of the righteousness which rules the earth and is in truth the living God—a message which is confused rather than described by making him half-prophet and half-sage.

President Harper's text-book on the *Priestly Element in the Old Testament*<sup>2</sup> appears in a third and considerably enlarged edition. It is a valuable aid to the historical study of the worship, ritual and laws of the Old Testament and is especially full in its references to authorities.

Professor Ramsay is perhaps the greatest living authority on the geography and history of Asia Minor, and he has now applied his special knowledge of the ancient communities of that region

<sup>1</sup> A CRITICAL AND EXEGETICAL COMMENTARY ON AMOS AND HOSEA. By William Rainey Harper. New York: Charles Scribner's Sons. \$3.00.

<sup>2</sup> THE PRIESTLY ELEMENT IN THE OLD TESTAMENT. By William Rainey Harper. Chicago: The University of Chicago Press. \$1.00.

to the interpretation of the *Letters to the Seven Churches* as found in the second and third chapters of the Book of the Revelation.<sup>3</sup> He holds to the authenticity and integrity of the Apocalypse, as against the prevailing recent view that it embodies Jewish apocalypses. His interpretation of particular passages is open to question, but his historical, geographical and archeological material on the churches addressed in these letters is very full and valuable. He is at one with all recent critics in regarding the book not at all as prediction but as a description of Christianity in its opening struggle with Rome.

A little book thoroughly to be recommended is Professor Porter's *Messages of the Apocalyptic Writers*.<sup>4</sup> It will be found very enlightening as to the books of Daniel and the Revelation, and will interpret them to any intelligent, fair-minded person not as puzzles of prediction but as interpreters of their own times. In no department of Biblical study has historical criticism better justified itself than in the interpretation of these strange, much abused writings.

The *Bible Problems* considered by Canon Cheyne<sup>5</sup> are principally the Virgin Birth and the Descent into Hell. These features of the Gospel narratives are explained as adaptations of Babylonian myths—a view advocated in Germany by Winckler and Gunkel, but which has not as yet gained general acceptance.

The commentaries on the Pauline epistles by the late Dr. Joseph Parker<sup>6</sup> are the first issues of a new "Practical and Devotional Commentary on the New Testament," edited by Dr. Robertson Nicoll. They give a paraphrase of the text and "improving" applications to modern life.

Mr. Balmforth's volume<sup>7</sup> consists of a

series of fourteen addresses made with the design of popularizing the results of the higher criticism of the Old Testament. Illustrations are chosen from the various classes of literature and periods of history, and some of the principal facts brought to light in recent study are presented fearlessly and with no little skill.

*My Lady of the North.* By Randall Parrish. A. C. McClurg & Co.

The most of us pass through a period in the evolution of our literary taste when the utmost of our demand upon the novelist is that he tell a good story. Some, indeed, unblushingly admit that they never proceed beyond that point, and even those who claim attainment of higher altitudes may be conscious of occasional descents to their adolescent plane of enjoyment. To all in this frame of mind, be it temporary lapse or permanent condition, *My Lady of the North* will offer some hours of decided entertainment. A story of the Civil War, it yet makes no pretense of dealing with its profounder aspects, but moves spiritedly through the recital of the battles, the raids, the romantic and often tragic conflict between personal attachments and sense of patriotic duty which were the surface indications of that national upheaval. No particular originality marks the style, and the characters are rather prone to converse in set speeches, but they are well-defined, the descriptive passages are vigorous, and the author has given us an agreeable change from the regulation war story by reversing the usual situation of the Yankee officer enthralled by some dark-eyed and rebellious daughter of a ruined plantation home. A Connecticut heroine in Virginia is a commendable departure from the easy and obvious in plot.

*The Lion's Skin.* By John S. Wise. New York: Doubleday, Page & Co. \$1.50.

This is a story of Reconstruction days in Virginia. And the publishers announce that with it the author "breaks a literary silence of some years." Meanwhile, every other writer of note in the South, and every one who could ever lay the scene of his story edge-wise over

<sup>3</sup> THE LETTERS TO THE SEVEN CHURCHES OF ASIA AND THEIR PLACE IN THE PLAN OF THE APOCALYPSE. By W. M. Ramsay, D.C.L., Litt.D., LL.D. New York: A. C. Armstrong & Son. \$3.50.

<sup>4</sup> THE MESSAGES OF THE APOCALYPTICAL WRITERS. By Frank Chamberlain Porter, Ph.D., D.D. New York: Charles Scribner's Sons. \$1.25.

<sup>5</sup> BIBLE PROBLEMS AND THE NEW MATERIAL FOR THEIR SOLUTION. By T. K. Cheyne, D.Litt. New York: G. P. Putnam's Sons. \$1.50.

<sup>6</sup> THE EPISTLES TO THE COLOSSIANS AND THESSALONIANS. THE EPISTLE TO THE EPHESIANS. Both by Joseph Parker, D.D. New York: A. C. Armstrong & Son. Each \$1.25.

<sup>7</sup> THE BIBLE FROM THE STANDPOINT OF THE HIGHER CRITICISM. By Ramsden Balmforth. New York: E. P. Dutton & Co. \$1.25.

Mason and Dixon's line, has been breaking his "literary silence" on the same subject. Eleven novels appeared last year dealing with the Civil War and the Reconstruction days. And no sooner did we turn over a new leaf and begin the new year than Tom Dixon tries to quench our smoking flax with "The Clansman." Now come two more from Captain Wise and Dr. Mitchell. Evidently there is something wrong with the Southern novelist. He does not know when to stop nor how to change his subject. One might infer from his representations that nothing ever did or will happen there, except "the war," and that the only thing which remains of interest is the negro problem. *The Lion's Skin* is written in a style similar to that of *The Southern Literary Messenger* in 1845, and by an author who is apparently so absorbed in telling the reader what he himself saw in Virginia just after the war that he does not allow his own characters to talk. They are almost obliged to make love by signs behind his back, while he engrosses the reader's attention with endless descriptions of the people, conditions and events. And if it is just the same to Captain Wise, we advise him not to break his "literary silence" again with the *débris* of antebellum civilization in the South. If no men have been born and nothing achieved there since the war, in the name of common decency, leave the brave old dead ones in peace. The way they have been raked up and shaken up in fiction during these last half a dozen years is enough to tease the wrath of heaven.

**Whosoever Shall Offend.** By Marion Crawford. New York: The Macmillan Co. \$1.50.

Occasionally Marion Crawford disappoints us with a story, which, however interesting, bears no psychic resemblance to his peculiar genius. This was the case with "Cecilia," and to a less degree with "Marietta." The latter was a sort of Venetian glass wonder cast in literary form. There was so much crystal beauty of coloring expressed before in words; but we missed the human, as if a thing so warm and changeable had no place in such an achievement, as, indeed, it had not. One might as soon expect to find

blood arteries in a Venetian vase. But in this last novel Crawford is at his best. He writes with the charm and originality of a man at the full tide of his powers, and not with the faded manner often observed in authors who have already written many books. The story leads up through the still life of the Italian mind to the knife-point in a dramatic situation. The character and temperament of the people is portrayed so accurately that the curious treachery and secretiveness peculiar to them no longer seem arbitrary traits, but logical development. Most writers of fiction who lay the scenes of their stories here show Italy at the end of an historical perspective or through a tourist's field glass, but Mr. Crawford presents the land and the people with the air of one intimately acquainted with both. Neither does the Pope dominate his imagination, as frequently happens even with writers like Mrs. Humphry Ward. But it is what the Italian really is, plus the Pope and poverty and tradition, that Mr. Crawford presents.

### Pebbles

A Boston spinster owns a dog,  
One of those high toned "towsers,"  
That's so well bred and nice, 'tis said,  
He never pants—he "trousers."

—*Philadelphia Post*.

....Ilda Brimmeyer and Frank Bleilie's horse ran away Sunday. They upset in the mud. Miss Brimmeyer lost her gold watch. All the girl's friends feel sorry for her. She is a nice young lady.—*The Dubuque Times*.

....Society in East Atchison was all agog last night, the occasion being a banquet at which covers were laid for over a hundred. The guests had been told what was coming, and there were no regrets. The spread was very elaborate, consisting of two tubs of fish, seventy-eight mud hens and a bucket of frogs. After the guests ate all they could hold, they carried home what remained.—*The Atchison Globe*.

FROM AN AUTHOR'S DIARY.

## The Duties of Directors

THE nature of the service performed and of the obligations assumed by a life insurance company should make the directors of such a company keenly sensitive to the requirements of all rules of propriety concerning the conduct of trustees. By law they are forbidden to do certain things, and, of course, they ought not to violate the law. But the peculiar character of their trust should cause them to be restrained by something more than the letter of the statute, and to avoid with scrupulous care any act that might serve, or seem to serve, their own personal interests at the expense of the policy holders whose interests they have undertaken to guard. The rule for them to obey should be that of the conscience of an upright and intelligent man. They have voluntarily assumed the duty of protecting the contracts made by their company for the benefit of widows and orphans, contracts sustained in many instances by annual payments made with great difficulty, by continuous sacrifice and by severe economy. The policy holder who performs faithfully his part of the agreement is entitled to security and to something more. He may justly demand his share of the fruits of honest and conscientious management. Directors, or officers, who by extravagance, loose management, large expenditures for little or no service, or a diversion of the profits of the business to their own pockets, unduly and unjustly increase the cost of insurance and reduce the policy holders' promised dividends, do not deserve the respect of their fellow men, even if in this they have violated no statute.

Men in places of such responsibility who thus immorally deprive policy holders, or the prospective beneficiaries of policy contracts, of just dues are especially deserving of reprobation. If in addition they violate laws designed for the protection of the purchasers of insurance, they deserve punishment more severe. It is very difficult, and

it should be impossible, for any one who defrauds a life insurance company by the ordinary methods of criminals, or robs a savings bank, or steals from a poor-box, to excite the sympathy of even the most thoughtless. It was discovered last week that one Lobley, a released convict, had defrauded the great Equitable Life Assurance Society of \$27,000 by conspiring with a dishonest clerk to procure a loan upon a policy stolen from the company's vaults. The two thieves have been arrested and are in jail. They will be vigorously prosecuted, and their just punishment will speedily begin. This is as it should be. No one will regret the conviction of these scoundrels.

In the statutes of New York may be found the following provisions:

"No director or officer of an insurance corporation doing business in this State shall receive any money or valuable thing for negotiating, procuring or recommending any loan from any such corporation, or for selling or aiding in the sale of any stocks or securities to or by such corporation.

"Any person violating the provisions of this section shall forfeit his position as such director or officer, and be disqualified from thereafter holding any such office in any insurance corporation."

It is admitted by at least one director of the Equitable Life Assurance Society (he is also an officer) that he has been a member, and even the leader, of financial promotion syndicates or groups that have bought large quantities of securities and then sold them to the Equitable at much higher prices. It is well known that his associates in these syndicates were other directors (some of them officers also) of the Society. It is publicly reported, but not yet proved, that the profits of these Equitable syndicate operations during the last three years have been between \$5,000,000 and \$10,000,000. It is known that loans amounting to millions have been procured by directors from the Equitable's funds; it has been repeatedly asserted and never denied that more than \$20,000,000 in securities have been sold to

the Society, not without profit for the sellers, by a firm the controlling figure in which is a prominent member of the Equitable's board.

Enormous salaries are paid by this corporation, in some instances to persons whose services in return for the pay are almost nothing. It has been repeatedly asserted, and not yet publicly denied, that to one director (a Senator of the United States) there has been paid \$25,000 a year for many years past. The Equitable controls, by the ownership of stock, several Trust Companies and banks. With these institutions millions of its funds have been deposited. The Trust Companies have assisted in the promotion of various undertakings. One of these was the Shipyard Trust. It is asserted, and has not been denied, that the leading officers of the Trust Companies (being also directors of the Equitable) were associated with a vice-president and director of the Society in the promoting and trading syndicates heretofore mentioned. With all these charges—some admitted to be well founded, others not yet denied—there are many others of less importance, but all of them pointing to a waste of funds that should have been sacredly guarded for the benefit of policy-holders, or to a diversion of a part of these funds for the personal profit of the guards themselves.

When we consider the offenses as to which admissions have been made by parties to the pending controversy, and those others as to which repeated public assertion has not been met by denial, and others still the commission of which is suggested by the official and other records of the dispute, we naturally turn to a list of the directors to ascertain who the men are who have either approved or permitted such maladministration. Among the fifty names are those of very prominent American financiers, capitalists and railway managers. Some of these men have had little or no knowledge of the Society's affairs. Others may have sought these places on account of the financial influence associated with them; others may have been moved to accept on account of the honor attaching to such a connection with one of the world's greatest fiduciary institutions.

There are others still who have been

false to their trust, using the influence and opportunities of membership for personal profit. But are not all of them responsible for what has taken place? Was it not the duty of every one to become acquainted with the affairs of the institution of which he was a guardian, and, if he could neither approve nor prevent what was taking place, to withdraw from the board, or, possibly, to make public protest? We trust that one result of the investigations now in progress will be a perceptible elevation of the moral standard to be observed in the board and the management of this great company and in other corporations where such elevation is needed.

### The Excellence of Useless Knowledge

THERE recently appeared in the pages of a popular magazine a list of the books read wholly or in part by President Roosevelt during the two years ending with the first week in November, 1903. It was a long list and of remarkable range. Of the Greek authors included were parts of Herodotus, Thucydides, Polybius, Plutarch, Æschylus, Sophocles, Euripides, Aristophanes and Aristotle. Of western European history, legend and tradition were parts of Froissart, the Nibelungenlied, Beowulf and Lady Gregory's "Cuchulain." Of modern history were Carlyle's "Frederick the Great" and Hay and Nicolay's "Lincoln." Of literature were four or five plays of Shakespeare, portions of Dante, of Milton and of Molière. The poetry ranged from Keats to Browning, from Poe to Bliss Carman, and the novels were of every grade, from Tolstoy and Sienkiewicz to Jack London and Mrs. Alice Hegan Rice. It is a list that convincingly reveals Mr. Roosevelt's devotion to what ninety-nine Americans out of a hundred are pleased to regard as useless knowledge.

Perhaps no man in our country at the present time is exerting so great a personal influence as its Chief Magistrate. His countrymen admire him; they accept his character, ideas and habits as standards, and they imitate him, as the boys of a school admire and imitate some one

of their mates who exhibits the positive qualities of force and leadership. We cannot help indulging the hope that among the tastes and habits that Mr. Roosevelt's countrymen may cultivate at his suggestion will be an increasing devotion to useless knowledge.

The time was, in America as elsewhere in the civilized world since the days of Pericles, when the acquisition of useless knowledge constituted education. Boys were taught Latin and Greek, not because classical learning would help them to run a factory or a bank, but because some familiarity with Greek and Roman history, thought and literature awakened in even dull minds an interest in other things than business. It opened up sources of enjoyment. It cultivated sympathies. It unconsciously created a feeling that the mind has a right to enjoy no less than a duty to produce. Building on the classical foundation, the old college course opened to youth some of the treasure-houses of history, world-literature and philosophy. The college graduate was able throughout life to turn, from time to time, to interests broader and finer than those of his money-earning vocation. Judged by practical standards they were useless, but they afforded him refreshment, inspiration and enduring satisfaction.

We have grown impatient of useless knowledge, and it is an infinite pity. Our schools, colleges and universities have for nearly a generation now been applying to every subject and method the test of practicality. More and more education has become technical. We are getting highly trained men, but narrow men; and every day the educated man in the old-fashioned sense of the word is appalled, as he meets and talks with the younger fellows and discovers how amazingly little they know. They do not read, they have not read. They explain that they have no time to read, that they never have had time. Their life is made up of hurry and grind. They seize impressions from the headlines of newspapers and from the gossip of the railway smoking car and the club. Out of these superficial and often worthless impressions they construct their opinions of politics, world tendencies, science and religion, philosophy and art. They can-

not back up their opinions by citations of fact, and they know nothing of the deep pleasure that comes through serious application, genuinely hard mental work, upon other than practical matters.

We believe that in this neglect of knowledge for its own sake, in this decay of the habit of serious intellectual application by American men and women, lies the real secret of our preposterous devotion to fads, follies of the moment, crazes of every description; the secret also of our sense of hurry and its attendant weariness. We lack the basis for cool and rational criticism. We do not know enough to pass a really serious judgment upon the thousand and one questions that come before us for answer. We are not aware that the same questions have been met a thousand times before in human experience and that human experience has already sifted folly from wisdom in dealing with them. We feel hurried and are easily fatigued because we have not acquired that firmness of nerve fiber, that steadiness and endurance of brain, which comes only with persistent and systematic attention to a wide range of intellectual interests, and because we have not acquired, through well directed study, the power to discriminate between things of unequal value and to eliminate from our lives those things that are not worth while.

For these unfortunate results our schools and colleges are, we think, greatly to blame. In abandoning useless knowledge they have forsaken the very springs of mental health and strength, the sources of wisdom, the living waters of rational enjoyment. We believe that President Roosevelt is the man among men that he is to-day, the man of power and influence, because, like the great men of other lands and of an earlier day in our own land, like Bismarck and Gladstone, like Jefferson, Hamilton and John Adams, he has continued through life to drink at the fountains of useless knowledge.

### All Ready

THERE is a jolly couple that live about two miles away through the hills, and they come over occasionally to make

the editorial rafters rattle with roaring laughter. Such a woman as that! Why, she has solved the whole problem of woman's rights and woman's mission without discussion or essays. She simply laughs a big, soulful, heart-lifting laugh and talks about whatever comes to hand. It is her business to brighten up the world around her and cheer it on. "Oh! Tolstoy is well enough," she says, "and Browning will do better than corsets; but the best book out is this big book of Nature. You cannot beat that and you cannot surpass its illustrations—not even in *Country Life* and *Country Calendar*. They only copy; Nature works out her own pictures at the same time that she does her work. A man or a woman is good for something just about as they can read this book easily and translate it into the vernacular of everyday thinking and doing. No King James about it, you see! You have just got a right to go out and use your eyes and your ears and your nose, too, and attend to what your senses find." This was not given as a preachment or as the conductor of a Teachers' Institute would give it, but was presented with laughter. Well, and why not? Why should not truth come with gladness, and fun and wisdom keep company?

We—that is, the editorial we—had just finished housecleaning. We mean the big outdoor house—the real house of a free soul, and body, too. It takes too much time—it really does—every spring to prune, and rake, and hoe, and burn the year's rubbish; to get it together and be prepared for another springing. Then, again, we have to give another three weeks in autumn to get ready for winter, which is a big contribution of brains and nerve to weather. The only thing to do about it is to get all the fun out of it we can. That is what this neighbor of ours, from over sunrise way, is good for—to help us see the downright jollity there is in common affairs. "Why, see," says she (the he in the case gets little chance for philosophy in words, but he puts it into work, and is just what a good laughter needs), "if everything just went right on—steady summer, with the same birds, same brook songs, same weather—we would get deadened to half that goes on, just

as we do to the ticking of a clock. In May the frogs' croaking is sweeter than robins' singing, just because it has been frozen up all winter. It either stops after a few weeks or else I don't hear it—which you must tell, for I really don't know. It's the novelty that gives the joy," and then the laughter overflows the words, as the roar of a brook drowns the rippling. But somehow it is the big-hearted laugh that does the work and makes the spring cleaning seem to be very tolerable.

Last week we had our last bonfire. Curious make-up it was. There were bits of everything that Nature had done for a twelvemonth and of what man's carelessness had undone. Have you noticed that in wild places, where folk have yet had no hand, Nature works just as if man were a part of the scheme? We are needed everywhere—to trim, to drain, to let in the sunshine, to discipline the rampant and then use up the superfluous for fuel—and bonfires. She—that is, Nature—makes a lot of stuff she knows is useless—a lot of overplus. She lets all her plant children have a jolly good time, growing, climbing hand over hand, wrestling with each other—spoiling each other's clothes. Man must see to that. Bonfires are one way of evening up this ebullition of Nature. Everything goes in except tin cans. (The world will soon not be able to hold these old tin cans. What shall we do with them? If we bury them we plow them out again. This is the greatest problem of spring cleaning.) But the bonfire is the jolliest thing in the world. Old people like it as well as the young, and in this way we get a fairly good ready on our neighbor's plan of finding fun in all that you do.

The crab apple blossoms are full in bloom along the northern line of States. The trees, some of them no bigger than shrubs, are balls of purest white, with a perfume that is full of ozone. The butterflies and the bees worship these trees as much as the Japanese, or we, do. There are big Ajax, fluttering around for a taste of honey, and there those delicious slips of sunrise, the yellow Turnus. You say you have lost your taste for butterflies since you have found they are only huge worms

changed over. Our neighbor says, "That is the fun of it, the oneness of everything. We are only splendid worms ourselves—worms of the dust, some one calls us. Worms of the air, I think. Everything has got wings; only find them. A woman as homely as myself can fly—and I intend to do it—always. Your cherry tree is only a stick till it blossoms, but look at it now! and that is hardly a hint of what it will be when the red cherries fill the branches. I tell you now there's lots of chances for the sticks and the bugs—and there ought to be." And her shouts of laughter make rings and waves away down into the valley.

Harry and Gladys are wheeling compost into the rose and aster beds and are forking about the sweet peas, running wires for trellises and tangles of strings for the climbers. Their tongues go as fast as their hands and feet, and they evidently do not know that they are hard at work. Work is one of the easiest things possible to abolish from this world—not by reducing the hours of labor, but by putting soul into it. She says: "Just co-operate better and then you won't know that you are at work. The fact is you will wonder, as you finish the job, when you did it. Everything is easy enough if people will pull together. You can't find a grumbler in the world who is not grumbling alone. Those two young people were not grumbling; they were anticipating—foreseeing the flowers, just as we are foreseeing the pears and plums. Heaven help a miserable soul that can't co-operate!" And all this time the great laughter punctuates the wit and crackles the air as it breaks up old selfishness. Yes, Gladys and Harry have done a lot of work, and you can see that they are still forking and wheeling and talking and laughing. It is dinner time and they must be called.

Everything knows that spring has come, and nearly everything is ready. In the morning the robins will begin the day at exactly four o'clock. They have put the philosophy of our jolly friend into a science. No matter if the air shakes out a belated snowstorm, they shout the glory of daybreak. Thousands of them, from East to West, from the

Atlantic to the Pacific! What a chorus! Then the barnyard cock claps his wings and crows until his neighbor answers from across the lake. Praised be the green earth and all that springs forth! It is a curious fact that no two things in all the world find out just the same rays of sunshine. "That is it," says our friend; "I don't see anything as other folks do, and I am glad of it. What a silly thing for people to try to conform. They cannot even get the same clothes, and if they could they would still look unlike. Bees get pollen and honey where we get fragrance and color. Then somebody else comes along and gets a poem. Let them have them. I will eat the honey and I will read the poem. We cannot all be Emersons. What an idiotic world it would be if we were. Can't improve on Nature." So we clean house. So we get ready for a change of season. We shout to Nature "All Ready!" Give us a shift of scenery! Strawberries for shortcake! Cherries for pies! Raspberries for cream, and apples, perfect only when eaten out of hand! When we have gone the rounds of the year, with good cheer and honest work, we shall cheerfully turn our faces to the past while the curtains are rung down for 1905.

### The Railway Congress

ALTHO the International Railway Congress, which was in session at Washington from May 4th to May 13th, is an institution of twenty years' standing, it was not until the Congress met in London, in 1895, that American and Canadian railway men took any interest in it. But when the International Railway Congress convened at Paris in 1900 a large delegation of American railroad men were in attendance, and the delegates were moreover deputed by the railroad organizations of the United States to invite the Congress to hold its 1905 meeting in Washington. This invitation was accepted, and from May 4th to May 13th there were in Washington some 1,100 railroad men from all parts of the globe in attendance on the various sessions of the Congress. Fully 350 of the delegates were from overseas, and there is not a country with any consider-

able railroad mileage which was not represented at the Congress. Germany was represented for the first time, and there was a larger and more representative gathering of British delegates—insular and colonial—than at any previous Congress. Except for the Canadian delegates, practically all these British colonial railroad men were representatives of Government-owned railroads. Before the Boer War the railroads in the Transvaal and Orange River Colony were represented by dividend earning companies, but with the British possession of these territories came Government ownership, and for the first time the Transvaal and the Orange River Colony were represented at the International Congress.

The Congress may be described as a great clearing house for railway world ideas and experiences. It is divided into five sections for the discussion of matters concerning (1) permanent way; (2) motive power and rolling stock; (3) operation; (4) general railway economy, and (5) light railways—railways for serving isolated rural communities which differ in their construction and operation both from trunk lines and street railroads and which are in service chiefly in countries of Continental Europe, having reached their highest development in Belgium, Austria-Hungary and Prussia. For a considerable time before the meeting of the Congress experts in the railroad world were appointed to act as Reporters. To each of these Reporters is assigned some particular phase of railway development or economy. The Reporter collects his data and submits his report and conclusions to the section of the Congress which is concerned with the subject. All these Reporters are, of course, experts in their special line, and each must be ready to answer questions and give supplementary information when the section is in session. Discussion follows. Then the "conclusions" of the section—in other words, the recommendations—are adopted and come before the Congress in general session for final approval. Most of the sections held two sessions a day for seven days, so that it will be seen that a great variety of subjects come up for consideration and report. In fact, it may be said that

when the Congress adjourned, and the 3,500-mile tour of the United States and Canada organized by the American Railroad Association began, it was impossible to name a department or phase of railroad work which had not come under review and concerning which some new light of information or experience had not been forthcoming.

Merely to catalog the subjects discussed would need two or three pages of *THE INDEPENDENT*, and a full report of the Congress with the speeches made at the official receptions and at the three banquets by Vice-President Fairbanks, Mr. Morton, Mr. Taft and Mr. Cortelyou would fill the pages of any of the New York newspapers for a full week. It is therefore only possible to indicate some of the features of the discussions in the various sections. One of these is the fact that comparisons showed that, notwithstanding the work of the Interstate Commerce Commission for eighteen years past, American railroads are freer from Government control than those of any of the Old World countries. On all European railroads there are Government regulations designed to prevent railroad employees from being too long on duty. These regulations are in the interest of public safety, and while none of the delegates questioned the utility of these regulations from this point of view there was a general feeling that when statutory regulations to this end are made they should allow as much elasticity as possible to the railroad management to meet the exigencies of railroad work.

Railroad rates were discussed for a whole day by the section concerned with general railroad economy. Here again it was shown that in America railroad managers have much more freedom of action than the managers of most European railways and certainly much more freedom than railway managers in Great Britain, who since 1891 have been tied down to freight classifications and rate charges fixed by Parliament, with a Railway Court constantly in session to see that justice is done between railroads and traders. President Stuyvesant Fish, of the Illinois Central, pleaded for a continuation of this freedom for American railways, and the Congress adopted

a recommendation in favor of a large measure of freedom for railroad managers provided there were no undue preferences for individual traders and all were served alike. Such freedom it was insisted was necessary for full development of railway transportation and for the most comprehensive service for the territories through which the railroads pass.

The United States has as yet no light railways in the European sense of the term. Some of the Continental delegates were convinced that in this country, with its far-reaching railway systems, light railways could be brought into service and would greatly develop isolated industries, which as regards European countries light railways were regarded as of such importance and utility that aid from the central and local governments was strongly recommended to bring about their construction and guarantee their operation. It was in this session in the course of this discussion that the statement was made by one of the French delegates that the tendency to State ownership of railways was becoming more general in Europe every year.

Two direct gains result to the United States from the Washington meeting of the International Congress. One affects the railroad world and the other the public at large. The sectional meetings, the railway exhibition in Monument Park and the tours on which over 300 delegates were taken as the guests of the American Railroad Association served to educate the Congress as to American railroad methods and economy and also as to the achievements of American manufacturers of locomotives and other railroad equipment. As regards the gain to the public, speeches of members of the Roosevelt Administration at the public functions of the Congress have served to focus the attention of the country on railroad rates and Government control over rates in a way that cannot but make for a clear and advantageous discussion of this great national issue.

### Goldwin Smith on Materialism

It is a matter of no little interest to observe how those who give up their belief in revelation or in God, and who de-

clare that the evidence for these beliefs has been shattered by modern criticism and science, yet dread the consequences of their conclusions and seek in some way by new evidence to recover what they have lost. They throw overboard the Bible, but, if they are men of high purpose and serious thought, they yet search for some new proof that there is spirit apart from body and that death does not end all, as materialism asserts. If all is matter, then there is, they say, no mind apart from matter, and the disintegration of the body means the extinction of the succession of thinking which we call the soul, and this conclusion they would seek to avoid.

Such a man is Goldwin Smith, who writes on the subject in *The Sun* of this city. He declares that these questions are "not to be treated lightly." It matters much, he says, to society, "whether death ends all and conscience is a delusion," for "the churches are a momentous part of our social organization, and on these beliefs they rest." He even ventures to hope that some new evidence may arise, perhaps in the line of psychical research, and that the investigation "may yet end in inducing the germplasm to limit its unbounded pretensions and leave room for the continued existence of spiritual life and of such hopes as may reasonably be attached thereto." That might give us, he says, "a new religion independent of tradition;" but meanwhile "there is a natural tendency to take refuge in fantastic speculations of the spiritualist kind against which we have to be on our guard;" for if we must lose our present religion, we want another that will give us the same assurance of God and immortality which the Bible and the Easter season prate of.

For he tells us that the overthrow of the biblical revelation by evolution and historical criticism involves not only the loss of the immortality of the soul, but also of belief in the existence of God. He says:

"We can no longer sincerely accept the evidence for the Incarnation, the Immaculate Conception [he means *Miraculous Conception*], the miracles, the Resurrection. . . . Nor, we must sorrowfully confess, is the collapse of our evidences limited to the case of revelation. It extends to natural religion. . . . Theism

itself has been seriously called in question, and arguments based on the proofs of universal beneficence, such as the writers of the *Bridge-water Treatises* deemed conclusive, will unhappily no longer prevail. The wrench is great; but through frank abandonment of that which cannot be sustained lies our only road to truth."

While the fearless search for truth is the only attitude for an honest man, and in the end surely the safest attitude, we do not find the evidence yet by any means conclusive that Darwin and the higher criticism have overthrown "conscience" and "immortality" and "Theism." Even on an utterly materialistic basis, God excluded, right and duty could just as well exist essentially and be discovered as can the ideas of beauty or truth. The assumption that there is no God and no future life does not make injustice just, any more than it makes the truths of mathematics false; it only reduces their sanctions. Right will still be right, even if not rewarded in the next world, and a decent man will obey it and society will enforce it.

Equally the doctrine of materialism which Goldwin Smith finds in evolution does not necessarily imply the extinction of the soul at death. Granted that there is nothing but matter, may not the soul be a refined sort of matter, such as we are now learning about, which may have been organized in the body, and yet survive its death? The body creates and throws off in the course of its existence myriads of chemical substances, combined within it, and preserved long after the body perishes, even such coarse substances as bone or hair, or such even simpler and more permanent substances as carbonic acid, which may or may not last forever; and who can deny that the nervous system of man may not, out of the more refined elements of matter, have organized a special thinking substance which we call mind, a sort of spiritual body which may survive the coarser physical body? What are those electric atomets, a thousand of which, they tell us, are attached to every atom of hydrogen? What are those inconceivably minute, imponderable emanations of radioactivity which physicists are not yet able to weigh with their coarse balances? Indeed, what is ether itself, of which the

author of the periodic law of the chemical elements tells us that he believes it is a sort of matter vastly more refined than hydrogen and helium, as they are more refined than gold? If, as they tell us, an atom of hydrogen is only a little maelstrom in the ocean of ether, somehow produced and then eternal, why, even on the materialistic hypothesis, may not new combinations of eddies in ether have been produced in the brain which will last after the rest of its substance has gone into other combinations?

And then as to Theism. Have the deniers of God, who imagine that the evidence for matter has extinguished God, have they thought what matter is? Have they thought that the elimination of God has reduced everything to Chance and made Chance a creative God? And Chance is reduction to absurdity, for inherent necessity is the only alternative to an eternal Will. But we know that the inherent necessity does not exist. We find change everywhere. If matter exists by an inherent necessity, why seventy different elements, and we do not know how many more? Why does hydrogen exist here and not there? Why hydrogen here and oxygen there? Indeed, why at all are atoms scattered about, dancing about, diverse and contingent, in small portions of the universal ether? Or if ether is the essentially necessary thing, and so universal and eternal, why does it not remain inherently and necessarily the same, instead of breaking up, as they tell us, into scattered eddies which we call chemical atoms, formed in the ether like the rings puffed from a smoker's mouth, here in this earth, and none between here and Sirius? There is no choice; what exists by its own necessity must exist everywhere and always the same. There can be no choice between necessity and contingency, between uniformity and variation, between Will and Chance. To deny God is to enthrone Chance, and Chance is nonsense; it is unthinkable; it is causeless events.

We are in no immediate hurry, *pace* Evolution and the Higher Criticism, in both of which we believe, to accept pure materialism, or even to throw overboard the arguments for design and universal

beneficence, and the Bridgewater Treatises.

### The Schiller Centenary

It had been known for some time that elaborate celebrations commemorative of Friedrich von Schiller would be held on the one hundredth anniversary of his death, but it is not probable that any one, even the most enthusiastic German admirer of his country's *Lieblingsdichter*, anticipated the almost passionate enthusiasm which attended the anniversary exercises of last week. In many German cities three-day festivals were held; the dramas were reproduced on most elaborate scale, the poems were recited by favorite actors, orations were pronounced by some of the leading men of Germany, who vied with each other in praise of the poet, processions marched through gala decorated streets, and a giant *Kommers* made German joy complete. In Austria also the day of Schiller's death was widely observed, and Switzerland exceeded the poet's fatherland in doing him honor, ascribing to Schiller the merit of having given classic and permanent expression to the ideals of Switzerland and the spirit of her people. Here in New York we witnessed a crowded assembly in Carnegie Hall, with a notable address by Mayor McClellan, a torchlight procession participated in by over 3,000 German men, and a superbly ordered celebration by Columbia University, at which President Butler, Professor Carpenter and Carl Schurz gave most unstinted praise to the great German, and Udo Brachvogel in an original poem in German and Heinrich Conried by the recitation of Schiller's "*Kraniche des Ibykus*" stirred the listeners to intense enthusiasm.

It is indeed the enthusiasm, the spontaneous outburst of deep passionate feeling, which is the noteworthy feature of this commemoration. Neither in Germany nor in any of the widely scattered world regions where the festival has been held has it been an academic celebration, manufactured to preserve interest in a particular language. A great people have risen, the learned and the unlearned, the men of influ-

ence and the common men, and have told out the love and loyalty of their hearts without restraint. Passion thrills in every festival poem and oration that has been published, and at the Columbia Celebration, at least, which one of THE INDEPENDENT staff was privileged to attend, the response of the audience to every fortunate characterization of Schiller's work and spirit was unmistakably earnest and sincere.

To one who has sat in a German university lecture room, under any of the German professors gifted in speech, this Schiller enthusiasm is not difficult to explain. The room grows strangely still when there is even the echo of a passage from one of the dramas and poems, and the voice of the speaker trembles as if he would deal reverently with that which had wrought in the making of his life. Herrmann, of Marburg, the great theologian, tells his students frankly of the years of his early life when Schiller's call to freedom was the food of his soul and the heroes of the dramas were deliberately placed above the saints of the Bible and the Church. Germans are proud of Goethe and boast that in *Faust* is at least one German creation that all the world must prize and preserve forever. Yet they feel that Goethe is not quite all their own; he is a Greek with a German accent. But it is always "*unser Schiller*"; they claim him as "*ganz Deutsch*," and speak his name with ownership, as perhaps no other poet's name is spoken save that of Burns by Scotchmen.

Doubtless many qualities contribute to the popularity of the author of *Wilhelm Tell*. His sheer poetic genius would have given him vogue, whatever he had cared to say. In the art of winged words he was a master. But they are right who say that Schiller is always didactic, never an artist for art's sake, but always a teacher, a prophet with a message. There is a literary criticism which has small praise for Schiller, because of the "diction of the exhorter," the evident intention to impress men for truth and for duty. Yet it is Schiller the exhorter, the herald of liberty, whom the German people love.

The hero of their youth is not the artist nor the master of rhythm, but the author of the wild cry of freedom in the *Räuber*, and the creator of *Wilhelm Tell*, the incomparable utterance of the elemental passion of liberty. Schiller was undoubtedly a man with a message, and freedom was unquestionably his message, and therefore is he loved by the folk for whose freedom he spent his life, and for whose larger freedom his spirit still strives.

Our own Milton loved liberty and appreciated it not less wisely nor less deeply than the German. But his utterance of it, the *Areopagitica*, is a prose document, a tract for its times, a classic of our literature, but forever impossible as an utterance to the people. If only he had sung of liberty, and put

"man's first disobedience,  
And the fruit of that forbidden tree"

into prose! Then perhaps we should have had a torchlight procession for Milton—may his shade forgive us!—but that we could have tolerated if along with the mighty men of the English tongue who have fought for liberty we could have had one to sing of it with perhaps even a deeper, truer note than did the great man whom German hearts these recent days have so beautifully, so enthusiastically and so worthily commemorated.

#### The President on Riots

Since in our last issue we spoke of the riotous scenes in Chicago, the President has passed through that city and received from a committee of the Federation of Labor an address which stirred him to administer what was a healthy rebuke. It was an appeal to the President that he refuse to send troops to keep the peace. Disclaiming all knowledge of the points at issue, and having received no call for troops, the President made it perfectly clear that peace must be maintained at all events. They made a great mistake in resenting any possible call for Federal troops. Men who declare that they reprobate violence and that violence hurts their cause *must* wish that violence put down, by the police, if possible; by the sheriff, if need

be, and by troops if other means fail. If they resent troops, when other means fail to preserve order, they prove they prevaricated when they said they deprecated violence; and they probably did not tell the truth when they said they did not encourage it. They can stop the violence if they wish. They can organize peace, if they believe that violence harms their cause. Certainly it does hurt their cause, and they are very short-sighted when they do not see it. They are too hot headed to see how they are injuring themselves. The best thing they could do would be to secure the wisest counsel and be guided by shrewd, level-headed men. Then we should not see them put to such disadvantage as some late revelations in Chicago show.

#### Mr. Smoot and the Senate

As we understand the matter—and we take it from *The Salt Lake*

*Tribune*, a strong anti-Mormon paper—the present aspect of the Reed Smoot case before the United States Senate and the Mormon Church is about as follows: The investigation before the Senate has proved, by confession and common report, that a majority of the Apostles are living in polygamy, and that two of them, Taylor and Cowley, have taken polygamous wives since the laws and the revelation called the manifesto have forbidden polygamy. Mr. Smoot announced that he would present a demand at the ensuing annual Conference that these two Apostles be suspended. But before the Conference met these two men defended themselves by declaring that seven other Apostles living in polygamy had as truly broken the law and manifesto as had the two who had only gone a little further and increased their plural relation. They did not care to be sacrificed for the sake of Mr. Smoot's admission into the Senate. A lively scrap seemed imminent, but it was escaped by "urgent business" which took Mr. Smoot to San Francisco, so that he could not attend the Conference and press the charges; and that ended the effort to put the Church on a practically monogamous basis. So after the two and the seven had been fairly accused and challenged they were re-elected without opposition,

and things are as they were and as they will be until these old men die. For it is clear that while the Church will discourage additional plural marriages it will not interfere to break up those which have been contracted. Mr. Smoot, however, is no polygamist, and if the Senate refuses to admit him it will be because he supports a Church which allows its chief men to live in plural marriage.

#### The Parthenon

There was held last month in Athens an international congress of archeologists, and a chief topic before them was the restoration of the Parthenon. Particularly interesting was the opinion expressed by Professors Dörpfeld and Fürtwangler—the highest German authorities—that the sculptures of the west front should be taken down and stored in a museum, being replaced by casts; and Professor Fürtwangler said that if Lord Elgin had not removed the sister sculptures to London posterity would have been compelled to do so for their preservation. That justifies Lord Elgin, who has been abused as the greatest vandal of modern times. Nevertheless, we wish, now that Greece is competent to take care of her archeological treasures, that the British Government might make a present of the Elgin Marbles to Greece, where they could be put in a museum there, and replicas might be placed in their original position; just as the treasures taken from Italy by Napoleon were restored to their original locations.

#### France and Japan

Deserving of all praise is the restraint of the Japanese Government in the matter of its complaint against France. Beyond all question the Russian fleets have used the French ports very much as if they were their own. But this seems to have been by the criminal complaisance of the colonial authorities, and in spite of definite orders from Paris. At last, after all the evil has been done, the French Government has waked up to the danger and wrong, and bids its Russian guests go in peace, to war. Japan's protests have been vigorous, and have been heeded too late. Japan has been seriously injured

in her chances against Rojestvensky's fleet; but, inferior altho she now is in battle ships, she believes she is a match for her foe, and she does not demand the aid of her English ally. France will have to meet, however, a heavy claim for indemnity, made before the court of nations; for France is responsible for the conduct of her officers at Saigon. They may have been bribed, or may have merely shown subservient hospitality to their guests; but whatever the explanation, no excuse of orders from Paris disobeyed at Saigon will be valid. Most damaging is the fact that the dispatch of huge supplies of coal and other supplies to Saigon shows that the plan of refitting on the French coast was made long in advance, and this must have been known there and should have been known in Paris. Apparently the colonial authorities have tried to deceive their superiors in Paris; or the latter have been parties to the wrong they are now trying to evade.

We have not disapproved of Mr. Carnegie's rule excluding from the benefit of his gift for superannuated college professors all sectarian and State institutions; but we have said that it "puts it up" to such institutions to increase their salaries, so as to equalize their offers to teachers. *The Omaha Bee* has entered into a campaign in behalf of the State institutions, so as to persuade Mr. Carnegie to take them in. But why not also the sectarian colleges? If they cannot compete, let them remember that they thus get the advantage of securing younger teachers, the ones with ambition to make a reputation, the kind of men, we have been told, who do the best work before they are forty, and who, when old and lazy, will be taken into easy berths in the pensioned colleges. We would say, Let the States pension their own professors, and other teachers also; and we shall come one of these days to a general pension system.

Once and again on his return trip from the West Mr. Roosevelt has declared that he will not accept a third term of office. Now he ought to be believed.

# Insurance

## Total Abstinence and the Death Rate

THERE has been considerable recent discussion as to whether or not the drink habit shortens life. A writer on insurance themes not long ago in touching upon this subject pointed out that the safe limit of risk, theoretically at least, is not over three ounces of whisky or its equivalent per day. THE INDEPENDENT of last week called attention to the declaration of Sir Frederick Treves, a distinguished English medical authority and surgeon to King Edward VII, that alcohol is a poison and that it is an injury to the system when taken even in a moderate degree. In view of all this the paper by Joel G. Van Cise, actuary of the Equitable Life Assurance Society of the United States, on the "Effect of Total Abstinence on the Death Rate," printed a short time ago in pamphlet form, becomes particularly interesting and pertinent. In the opening portion of his paper Mr. Van Cise refers to some figures derived from the experience of the Mutual Life Insurance Company of New York, as cited by Mr. Emory McClintock in a paper prepared by him in 1895, entitled "On the Rates of Death Loss Among Total Abstainers and Others."

In the matter of longevity those who are total abstainers appear to have the best of it since, according to Mr. Van Cise, the percentage among abstainers of the actual death loss to the expected death loss was 78, while the corresponding percentage among the non-abstainers or moderate drinkers was 96. These figures will be cordially welcomed by those who are looking for arguments in favor of total abstinence and prohibition.

The question of indulgence in alcoholic beverages is one of world wide interest, and as high an authority as the late William E. Gladstone has declared that intemperance has been productive of more evil than war, pestilence and famine combined. The lessening of such an evil may well seriously engage the attention of the officers of any life insurance company.

Drunkenness is universally condemned and deplored, but all drunkenness began

with moderate drinking. Mr. Van Cise states that the effect of total abstinence is to lower the death rate and to increase the average duration of human life. He appears satisfied that it is so and he logically closes his argument with a plea for total abstinence which may well be most carefully considered and heeded, even if he may not have absolutely proven his case. In this connection the following table ought to be a trifle startling to the "moderate drinker":

DEATHS AMONG DRINKERS AND NON-DRINKERS.  
(From statistics Compiled by Life Insurance Actuaries.)

|                               | Drinkers. | Abstainers. |
|-------------------------------|-----------|-------------|
| In 36 years.....              | 11,241    | 6,300       |
| Between the ages of 20 and 70 | 57,891    | 46,956      |
| Between the ages of 40 and 50 | 10,861    | 6,246       |

The last figures show an excess of 74 per cent. Between the ages of 20 and 30 it was 11 per cent.; from 30 to 40, 68 per cent.; from 50 to 60, 42 per cent., and from 60 to 70, 19 per cent. The period from 40 to 50 is regarded by the insurance men as the "prime of life."

WISCONSIN has passed a law prohibiting the sale and use of giant fire-crackers. This is a wise step, but so long as the toy pistol lingers with its possibilities in the way of death by lock-jaw it is evident that all accident hazards have not been removed even in the Badger State. The prohibition of the sale of the cannon cracker is, however, bound to reduce the list of Fourth of July casualties and should also somewhat reduce the number of fires. Other States may well follow the example of Wisconsin.

....The Chicago *Record-Herald* is authority for the statement that the Royal Arcanum will have to consider the question of increased rates at the meeting of its Supreme Council at Atlantic City, which began there yesterday. Those high in R. A. councils admit that the present margin between assessments and death claims approaches the inadequate, which is exceedingly serious in view of the increasing death rate. Considerably more rigidity in medical examinations must come, and the probabilities are that future assessment rates will be figured from the nearest birthday of the applicant, instead of from his last natal day.

# Financial

## Trade with Germany in Danger

It was announced in dispatches from Berlin, three weeks ago, apparently by authority, that formal notice had been given to our Government that our commercial agreement with Germany would terminate on March 1st, 1906, when Germany's new tariff and new reciprocal agreements with seven European nations will become effective. Denials of this have since been published, but it is quite well understood that the agreement will terminate on that date and that the United States will thereafter be at a disadvantage with respect to exports to Germany unless in the meantime a new treaty of reciprocity shall have been made and accepted. That is to say, the duties on American products imported into Germany will be very much higher than duties on similar products from Russia, Austria, Italy and the other countries that are parties to the new German treaties. Germany has recently been buying more from us than from any other country, about \$215,000,000 worth of goods annually. Her sales to us are about \$110,000,000. Imports from this country have more than doubled since 1890, while our purchases from Germany have shown an increase of only 12 per cent. On the other hand, Germany has found friendly and inviting markets in the European countries, notably in Russia, whose purchases of German goods have grown rapidly.

If we should make no new agreement, and thus fail to gain the advantages enjoyed by the seven treaty nations, the increase of duties would be applied chiefly to farm products—wheat, corn, rye, flour, lard, salted meats, dried fruit, etc. Duties on these products imported from this country would be higher by from 25 to even 150 per cent. than those imposed upon similar products from the treaty nations. Clearly, the import trade in such products would be almost wholly diverted to those countries. We are now selling to Germany \$16,000,000 worth of breadstuffs and \$21,000,000 worth of provisions. It is true, however, that the bulk of our exports to that country—including \$109,000,000 in cotton, \$11,-

000,000 in copper and \$4,000,000 in oil cake—would not be affected, being still free of duty. But our sales of dutiable products to Germany might be reduced by \$30,000,000.

Altho our Senate regards treaties of tariff reciprocity with marked disfavor, it is probable that a treaty with Germany will be negotiated before the coming session of Congress. We hope it will not meet the fate of the similar treaties negotiated by Commissioner Kasson under the direction of President McKinley.

THIS year's output of gold in Alaska, on both sides of the boundary, will be about \$22,000,000.

....Our imports of india rubber have increased from \$10,000,000 in 1884 to \$44,500,000 in 1904.

....Plans have been completed for additions, the cost of which will be \$20,000,000, to the works of the Carnegie Steel Company in Youngstown, Ohio.

....April's pig iron output was 1,922,041 tons, against 1,936,264 in March, which still holds the record. The weekly capacity of furnaces in blast was higher on May 1st than ever before.

....The North American Trust Company, the Trust Company of America and the City Trust Company have been merged into one institution, called the Trust Company of America, and Oakleigh Thorne, formerly President of the North American, is President of it.

....A very large crop of winter wheat is indicated by the Government's report, issued on the 10th. An estimate based upon acreage and the high condition (92.5) points to a crop of 460,000,000 bushels, against 332,935,000 harvested last year.

....Dr. Howard, Chief Entomologist of the Department of Agriculture, predicts that before the present cotton season is over, the boll-weevil, moving eastward, will cross the Mississippi. Seven parishes of Louisiana have already been invaded by the destructive insect.

....Dividends announced:

Amer. Express Co., \$3.00 per share and extra \$1.00 per share, payable July 1st.

NEW YORK, THURSDAY, MAY 25, 1905

No. 2947

## Survey of the World

### National Topics

Mr. Roosevelt will visit several of the Southern States in a brief trip during the early days of October, returning to Washington before the 16th, when, it is expected, the special session of Congress will begin. His purpose will be to accept the hospitality of the only States—Florida and Arkansas—which he has not visited since he became President. It is asserted in Washington upon what seems to be good authority that the railway expenses of his recent vacation tour were paid by himself and that he will not accept free transportation hereafter.—Mr. Bryan will sail for Europe in September, intending to remain abroad for several months, seeking rest and studying experiments in municipal and State ownership of public utilities.—It is understood that the President assumes responsibility for the decision of Secretary Taft and the Panama Canal Commission's executive committee, on the 15th, concerning the purchase of canal material and supplies. We refer to the decision on another page. The Commission will make no unnecessary purchases before the session of Congress, when there will probably be an attempt to require by legislation the use of the products of American manufacture. Secretary Taft laid the question before Congress last winter, virtually asking for instructions, but Congress declined to give any. It is understood that the President's decision was not approved by three members of the Cabinet—Secretaries Shaw, Wilson and Metcalf. It has been attacked in published interviews by Representatives Dalzell and Grosvenor and other Republican opponents of tariff revision.—Secretary Morton will retire from the Cabinet on or before July 1st. It is reported that the evidence in the case

against the Atchison Railroad Company will soon be laid before a grand jury in New Mexico by the Government's attorneys, Messrs. Harmon and Judson.—The passage of Governor La Follette's Railroad Commission bill by the Wisconsin Senate leaves him free to accept the Senatorship to which he has been elected. He is to appoint the three Commissioners, who will have power to fix rates. But their decisions will be subject to review by the courts, and the old rates are to stand until the new ones are thus confirmed.

### Philadelphia's Gas Works

The proposed lease of Philadelphia's gas works for 75 years to the United Gas Improvement Company was approved on the 18th inst. by the city Councils at a meeting marked by wild disorder. Only one competing bid had been made, the terms of which were characterized by Mayor Weaver as "infinitely better" than those of the original scheme; but the Councils paid no attention to it, apparently for the reason that they were under orders to approve the project which had excited so much indignation throughout the city. They also coolly ignored the written request of the Mayor for a postponement of final action in order that he might examine the propositions. He and the protesting organizations of citizens preferred that the present lease (to expire in 1927) should not be disturbed or displaced. At the meeting the galleries and corridors were crowded with angry citizens, held in restraint by 100 policemen, some of whom had revolvers in their hands. After the protesting speeches of prominent residents the lease was promptly

"jammed through," while from the galleries came the cry, "thieves! thieves!" Ropes with nooses at their ends were dangling over the railing, and on placards attached were the words: "These for our Councilmen." Badges were worn bearing a picture of a gallows over the inscription: "The last resort." In the corridors the crowd was singing "We'll hang Tom Dolan to a sour apple tree." Mr. Dolan is president of the United Gas Improvement Company. The vote in the Common Council was 74 to 9; in the Select Council it was 37 to 4. In each branch there is only one Democrat, and the two voted no. The result indicates an easy passage of the lease ordinance over Mayor Weaver's veto, which is to be announced this week. But the Citizens' Committee is striving to arouse public sentiment in every ward by meetings and in other ways in order that Councilmen may be subjected to local pressure. Rope brigades will be organized for the Councils' meeting at which the veto will be received. "A more iniquitous measure," says the Mayor, "was never forced upon a free community." He has been urged to remove from office certain heads of municipal departments whose great influence over Councilmen has been exerted for this gas lease. This he now has power to do, but his power to remove or appoint the Directors of Public Safety and Public Works (who control the police and fire departments and the public contracts) will soon be taken away and given to the Councils by the bill which Governor Pennypacker recently signed and defended. One concession was made by the projectors of the lease before the vote was taken. The price of gas, instead of being fixed at 90 cents for 53 years after 1927, is to be 90 cents from 1921 to 1936, 85 thereafter until 1956 and 80 for the remaining 24 years. But for \$25,000,000 in hand the city surrenders more than \$100,000,000 in annual revenue, the provision for a reduction to 75 cents in 1918 and the right to take the entire property, with all improvements, in 1927. With difficulty the newspapers find words for their indignation. "It is crime so daring and outrageous," says the *Ledger*, "that to

most honest people it has seemed incredible." Says the *Press*, the leading Republican journal:

"The outrage stands unequalled and unapproached in the history of municipal crime. Tammany Hall, even in the hey-day of Tweed's most daring brigandage, never dreamed of such colossal pillage. It stands alone, unexampled, overtowering in its audacity and infamy."

All the newspapers are in agreement as to the character and magnitude of the offense.—The Massachusetts Legislature has made the maximum price of gas in Boston 90 cents and restricted the capitalization of the combined companies to \$15,126,000.—In Cleveland, Mayor Johnson, for the city, has offered the street railway company \$85 a share, or a little less than \$20,000,000, for its entire capital stock, asserting that this is a just and fair price.

#### Private Car Lines

Interesting testimony concerning the private car lines of the Armour company was given last week before the Senate Committee. Mr. Robbins, president of the Armour Car Lines Company, admitted that the company had from twenty to thirty exclusive contracts with railroads for the transportation of fruit, and that it had a monopoly of such traffic in parts of the West and South. In the territory covered by these exclusive contracts producers and shippers of fruit had to accept the rates fixed by the company, for the railroads were restrained by the agreements from carrying the fruit in cars of their own. His company had a monopoly in Georgia and Florida; it had exclusive contracts with all the South Atlantic coast roads and on the Southern Pacific. He insisted, however, that the Atchison road was in competition with his company in the fruit business of California. It has been asserted that this competition was suppressed by pooling agreements bearing the signature of Vice-President Paul Morton. The Armours, Mr. Robbins said, shipped their packing house products in the company's cars, but had no advantages over other shippers, altho they owned the company. He claimed that the company was not subject to the interstate commerce laws, and declined to answer certain questions about its business and earnings. "It seems," said Chairman

Elkins, "that you have all the advantages and none of the responsibilities of common carriers."—President Mead, of the National League of Commission Merchants, testified concerning these Armour cars, asserting that after the exclusive contracts were made the price of transportation was increased by 300 per cent. Mr. Mead quoted from testimony which had been given, he said, before the Commission in Chicago, week before last, by an officer of the Atchison road, to the effect that his company had to pay rebates now in order to compete with the Armour cars. Chairman Elkins remarked that if the statement was true the company was guilty of a flagrant violation of law.—Reports of the hearings in Chicago, as published in that city, show that a former confidential employee of the Armours, named Streycckmans, gave what was said to be a complete description of the car company's private policy. Large rebates were always paid, he said, to favored shippers. He gave a long list of the names of those who had received rebates exceeding 50 per cent., and the names of others to whom about 45 per cent. was paid. He also produced what was admitted to be a copy of the company's secret code book, in which there were words covering a large variety of messages of instructions concerning the payment of secret rebates, a word for the name of each of the Interstate Commerce Commissioners and other words giving warning of a Commissioner's approach. The word "Launch" stood for "Better arrange rebate there," and the word "Lava" for "Pay rebates from cash on hand."

#### The Strike in Chicago

It was expected on Saturday last that the teamsters' strike would be ended by action to be taken that night at a meeting of the strikers; but at midnight it was decided that the strike should be continued, because the seven express companies refused to take back any of the teamsters who had left their service. With respect to other employers the strikers were ready to make what would have been virtually an unconditional surrender, consenting to an "open shop" for the Employers' Team-

ing Company, and agreeing that other companies should take men back only to fill vacancies and should reject all who had violated the laws. Their willingness to accept these terms—which, it was estimated, would permit the employment of only 35 per cent. of the strikers—was due to the effect of President Roosevelt's address to their committee, to the changed attitude of Mayor Dunne, and to public indignation excited by revelations concerning the employment of hired ruffians to assault non-union men or union men who remained at work. The Mayor had promised to call for troops if the strike should spread, and he had begun to revoke the licenses of cabmen who refused to carry citizens to the boycotted stores, the first driver so punished being the president of the Cabmen's Union. Mr. Gompers had come to the city, and his influence had been exerted in favor of the acceptance of such terms as could be obtained. During last week there was not much rioting, but one man was killed Saturday night in the course of an attack upon non-union drivers. This was the eleventh in the list of deaths by violence. The strike spread to the public schools. In six of these the pupils, or a majority of them, went on strike because coal was delivered at the school buildings by non-union drivers. Many of the boys joined the mob in attacking these men, and some were urged by their parents to do this. Eight boys were arrested and sent to the House of Correction; fines of \$20 were imposed upon the parents of several others.—The disclosures concerning the employment of ruffians by union authorities relate primarily to the Carriage Makers' Union, which is not involved in this strike. They were made, by confession, in connection with the murder of Charles J. Carlstrom, in April, and the confession (a written one, which has been published by the authorities) is that of C. J. Casey, business agent of that union. Charles Gilhooley, a released convict, who admits that he murderously assaulted Carlstrom and was paid for it, boasted of his crime while drinking in a saloon. His arrest was followed by that of Casey, who re-

pented and confessed. This led to the arrest of the three members of the union's Executive Committee, who had appropriated the money to be expended in paying for such assaults, and of Gilhooley's assistants, Edward Feeley and Mark Looney. These men are held for murder. They have been identified as the assailants of Carlstrom, and, as has been said, Gilhooley admits that he did most of the work. A strike had been declared, but at the Meekel Wagon Works only a few of the forty union men went out. Carlstrom, a good workman, was the leader of those who remained. One evening, as he was about to enter his house, where his wife and child were waiting for him, he was attacked by the three ruffians, who left him for dead. He died two or three days later. The price paid for this was \$15, out of an appropriation of \$50. It has been ascertained that at least one other man died of injuries inflicted by the same ruffians, and that a man named Anderson, still living, was beaten by them. It is reported that the authorities have evidence of 19 similar assaults by Gilhooley and his confederates. Casey says, in his confession, that Gilhooley, when \$8 was offered to him for the assault upon Carlstrom, demanded \$15 because "other unions were paying that for a knock-out."—At the end of the long strike in the Fall River cotton factories, it was agreed that Governor Douglas should make an investigation and report as to what the average margin should be, between the cost of cotton and the selling price of cloth, to permit a 5 per cent. increase of wages from the end of the strike (in January last) to April 1st. He now reports that the margin (for a specified quantity) should be 74 38-100 cents. As the actual margin has been less than 60 cents, the manufacturers are not required to increase the wages of the three months, which have been on the basis of the reduction which caused the strike.

Outlaw Forces  
Exterminated in Jolo

After ten days' hard fighting in the jungles of Jolo island, Gen. Leonard Wood has exterminated a large party of piratical out-

laws, commanded by a Moro chief named Pala. The engagements took place during the first two weeks of the present month, but the news was delayed in transmission. In the first week about 300 of the outlaws were killed. Those remaining sought refuge in the swamps, but were attacked there. Pala himself was slain, and it appears that very few of his 600 followers survive. Nine of General Wood's men were killed and 21 wounded. When our Government took possession of the islands, Pala, who had been a slave-trader and pirate, fled to a small island near Borneo. One of his lieutenants having deserted to a neighboring British settlement, Pala landed a force there and demanded that he be given up. When this was refused he ordered a massacre, and it is said that 25 residents were killed. For this reason the British colonial authorities do not mourn now over his death. Pala recently returned to Jolo and organized this uprising, which General Wood has so effectively suppressed. None of the resident Moro chiefs appears to have been implicated.

Cuba and  
Porto Rico

At the recent convention of Liberals and those Moderates who do not support President Palma, the platform or declaration of principles unanimously adopted contained a paragraph asserting that Cuban sovereignty was in danger of being weakened by the Platt Amendment and calling for a revision of the permanent treaty of which the Amendment is a part. But a motion to place this paragraph at the head of the platform as the leading issue was defeated by a large majority. Some said that under the restrictions of the Amendment Cuba could never be free. A majority were of the opinion that the treaty could not at present be revised, and that the paragraph should be retained only as "a future aspiration." The convention made declaration of intention to carry out the accepted scheme of sanitation, with Government aid for municipalities wherever it should be needed. President Palma has vetoed the bill appropriating \$1,500,000 to assist the larger cities in sanitary work, on the ground that by the Platt Amendment the Government is re-

quired to do this work by direct action. The Presidential candidate of this convention is Gen. José Miguel Gomez, Governor of Santa Clara.

#### Church Union

The May meetings of the denominations have been mainly devoted to Church union. Union between Northern Presbyterians and the Cumberland Church had been approved by the presbyteries, but the opposition was sufficiently great to lead their General Assemblies to take further time for deliberation, so that union will not be immediately accomplished. The principal definite action for union was taken at Kansas City at the Quadrennial Conference of the United Brethren, when they agreed by the overwhelming vote of 246 against 5 to accept the plan of federation with the Congregationalists and the Methodist Protestants, looking to complete consolidation at a hopeful future time. The meeting was a most enthusiastic one. The "Syllabus" for the federation proposed was carefully explained at a great meeting on Monday evening, when Chancellor D. S. Stephens, of the Methodist Protestant University at Kansas City, and Moderator Washington Gladden, representing the Congregationalists, made addresses, which were enthusiastically received. They showed that the three denominations preach the same Gospel and serve the same God, and that combination would create a great missionary and educational force, thus securing the solidarity of ecclesiastical life, while sacredly guarding the liberty of the individual conscience. In behalf of the United Brethren Dr. L. S. Cornell detailed the careful and full consultations which had resulted in the plan of federation proposed. Dr. R. W. Funk, agent of the Brethren Publishing House, then offered a resolution adopting the proposed plan of federation, and its consideration was postponed till Thursday in order to give full time for consideration and for the expression of opposing views. A full discussion was had on Thursday, and it was then adopted by an almost unanimous yea and nay vote, all the seven bishops being in its favor. Already, at their national meetings, the Congregationalists and the Methodist

Protestants had adopted the Syllabus, and the next step will be to call a General Council of the three denominations to determine on the plan of union and work. The Bishops were appointed with power to select the other members for the United Brethren Church. It will now be the duty of the other denominations to appoint their members, when a time will be set for the Council to meet.

#### The Strike at Limoges

The strike, which began in the Haviland porcelain works from the demand made by the workmen for the dismissal of two foremen, extended to other factories and has kept the city in such a state of disorder as to threaten the destruction of the industries of the place. For a second time the national Government has been compelled to intervene to restore order, and the Prefect of the Haute-Vienne has taken charge of the police and brought in gendarmes and dragoons to patrol the streets, in spite of the protests of the Municipal Council. The Mayor of Limoges, M. Labossière, is a member of the Socialist group of the Chamber of Deputies, and both he and the Municipal Council, which is composed of Socialists, have sympathized so strongly with the cause of the workingmen that they have not afforded protection to the employers and the men who wished to work, altho they have by resolution condemned violence as injurious to proletarian interests. The porcelain works were sacked, a motor car of the proprietor burned and buildings blown up by bombs. M. Beaulieu, proprietor of a shoe factory, was besieged with his wife, mother and children in his establishment for several days by the strikers, who encamped about the place in tents and threatened to burn the building with the people in it unless their demands were granted. Beams were placed across the doors and only a small quantity of food was passed in. No one was allowed to enter or leave. The twelve-year-old son of the concierge who tried to get out was attacked and his ribs on both sides of his body beaten in. No physician was allowed to pass through the guards to

attend him. The family were finally rescued by a company of a hundred gendarmes sent by the Prefect and conducted to a neighboring town. M. Beaulieu then met a committee of the strikers and his creditors at the office of the Mayor. He expressed himself willing to open the factory and to re-employ as many of his former workmen as possible, but stated that since orders amounting to \$90,000 had been countermanded on account of the strike he would not be able to use more than 50 workmen out of the 300 now striking.

#### The Defense of the British Empire

On May 11th Premier Balfour gave to the House of Commons a general statement of considerable importance of the plans of the Government for the defense of England and the colonies. He stated that the Admiralty had decided that submarine mines constituted an inexpedient method of defending ports. They were more likely to injure the defenders than damage the enemies. The danger to neutral vessels from the floating mines used in defense of Port Arthur had proved so great that he thought the question of their use ought to be brought before some international tribunal. In regard to defending England, Mr. Balfour stated he would consider France as the enemy simply because this was the nearest country, altho it was the last thing in the world to be regarded as possible. It was the opinion of Field Marshal Lord Roberts that it would be useless to attempt the invasion of Great Britain with less than 70,000 men, and even if these landed it was but a forlorn hope that they would reach London. The Committee of Defense thought it advisable that the fleet and army should be concentrated in the center of the Empire, from which they could be distributed as the necessity arose. In case England should be attacked in the absence of the Mediterranean, the Atlantic and the home fleets the Admiralty would still have ready for service within a few hours 6 warships, 18 cruisers, 25 torpedo boat destroyers and 95 torpedo boats, together with submarine boats,

and he considered that it would be impossible to land troops upon the English shore. Mr. Balfour said that the Government was seriously considering the advance of Russia toward the Afghan frontier, altho he did not believe the invasion of Asia formed any part of the plans of the Russian Government. If Great Britain permitted the slow absorption of Afghanistan in a way similar to that in which the Central Asian States had been absorbed, and if Russia's strategic railroads were allowed to creep closer and closer to the frontier, Great Britain would be faced with the greatest military problems which had ever confronted her. These remarks of the Premier must be taken into consideration in connection with the recent reports that the accumulation of Russian troops on the Afghan frontier and the construction of the Russian railways in Central Asia have been continued during the war. The work on the Orenburg-Tashkend section of the Russian railroad was begun at both ends and has been continued steadily for two years. The line from Orenburg reached the Sea of Aral in the fall of 1903, and last fall the whole road was open for traffic. Russia now has as a railway base of concentration the Merv-Bakhara-Khokand line; two lines of communication by rail in the rear and two advance feelers abutting on the Afghan frontier. The results of the British Mission to Kabul this spring have not been given to the public, but it is rumored that the Amir refused to allow a railroad to be constructed from India into his territory. The request of the Amir for an Afghan seaport was refused, but he was assured of the British protection of his country.—The Turkish Government has asked London for an explanation of the presence of four British warships lying off Koweit in the Persian Gulf. Lord Lansdowne replied that there was nothing unusual in this, for some British warships were almost always employed in police duty in the gulf. It is reported that the British marines have been landed at Koweit and have thrown up fortifications, which in consideration of the rebellious condition of the province may well cause the Turk uneasiness.

### The Czar's Councils

It is reported from St. Petersburg that the Czar on his birthday, May 20th, signed a ukase authorizing a Zemsky Sovyet, or Council of the People, to meet next fall. The ukase will be published May 27th, on the anniversary of his coronation. The proposed national assembly will have no legislative power in itself, but will merely make recommendations to the Imperial Council. This is not likely to satisfy the zemstvoists, who demand a share in the actual government of the country. At the recent Moscow Conference the Shipoff faction, who favored an advisory council not in any way infringing on the powers of the autocracy, were in a minority, and Mr. Shipoff himself was left off of the Committee of Arrangement of the next congress of the zemstvos. The Moscow Conference recommended that members of the zemstvos refuse to serve on the various governmental reform commissions, as they are really intended to impede and postpone the reforms needed in Russia.—The Czar has ordered the establishment of a permanent Council of National Defense

"in order to insure the development of the empire's fighting force in a manner corresponding to the needs and resources of the State and to secure uniformity in the duties of the supreme naval and military administrations and harmonize them with those of other Government institutions in questions affecting the safety of the State."

A special commission under the presidency of the Grand Duke Nicholas Nicholaievitch is appointed to draw up the plans.—Some concessions have been granted to the Poles by the Czar in a recent ukase which permits peasants to rent and purchase land and allows the Lithuanian and Polish languages to be taught to certain extent in the schools. The children of Poland have recently been taking the language question into their own hands and there have been numerous school strikes.—An attempt was made on May 19th to assassinate Governor-General Maximovitch as he returned from service at the Warsaw Cathedral, but the bomb was exploded, accidentally or intentionally, in the hands of the Polish shoe-

maker who carried it just as he was about to be arrested as a suspicious personage. The explosion killed him and the two detectives and tore their bodies to pieces. Twenty-three other persons in the vicinity were injured. Major General Sokolovsky, Governor-General of the Province of Ufa, was fired upon several times while at an entertainment in the public garden and was severely, perhaps mortally, wounded. His predecessor, General Bogdanovitch, was assassinated in the streets of Ufa on May 19, 1903.

### The Russian Navy

Admiral Rojestvensky's united fleet again visited Hon-Kohe Bay, but did not remain there long. Admiral de Jonquières, the French naval commander, made another cruise along the coast of French Indo-China on the 15th, and on his return to Saigon stated that there were no Russian vessels in any of the ports. The Russian fleet was reported in latitude 13.30 N. and longitude 111.30 E. on May 16th. A fleet of 150 Chinese junks heavily laden with provisions for the Russian vessels were seen in Kwang-Chau Bay, Lie-Chau peninsula. Part of the Russian fleet, consisting of eleven of the slower vessels, returned on May 19th to the coast of Anam and anchored off Port d'Ayot outside the three-mile limit. The rest of the fleet, relieved of these, is expected to make a dash through the Pacific Ocean for Vladivostok, possibly coaling north of Luzon, for colliers and supply ships are reported to have rendezvoused in Balintang Channel. Admiral de Jonquières has again gone to Port d'Ayot to see that there is no violation of neutrality on the French coast.—President Roosevelt has refused to join in the proposed international effort to clear the China Sea of the floating mines which are doing so much damage to neutral vessels. Our Government takes the position that American interests are too slight to warrant sending a warship into the zone of marine belligerent operations.—There are persistent rumors of the severe illness and incapacity of Admiral Rojestvensky, who is said to be suffering from nervous prostration and organic disease. Vice-Admiral Birilev was

said to have been ordered to go to Vladivostok to take charge of the fleet when it arrives there.

### Oyama Advances

After the capture of Mukden the Japanese pursued the retreating Russians up the railroad beyond Kaiyuan and then halted, since which time both armies have maintained their positions without any serious fighting for nearly two months. Now, however, the reports

The Japanese are advancing in three columns northeast along the railroad from Kaiyuan and Changtufu. The opposing Russian forces occupy strongly fortified positions extending across the railroad from the boundary of Mongolia 42 miles toward the east. There is also a Russian force still further to the east on the Tongta River, a branch of the Sungari joining that river at Kwanjir. This force is in command of General Patorilov, with head-

quarters at Hailung-Cheng, on the Tongta, about 70 miles southeast of Szepingkai, thus defending Kirin from the southwest. Between the Tongta River and the railroad there is a range of low mountains. The country north of Changtufu is hilly and deeply cut by ravines, therefore well adapted for defense. The spring rains are over and the roads are drying. Correspondents report that Harbin is the scene of riotous dissipation of Russian officers and men. Music halls and theaters are numerous and always crowded, and Monte Carlo is outdone in reckless gambling by this military camp. Vladivostok is being prepared to receive Admiral Rojestvensky's fleet and also to withstand an expected attack from land. All foreign consuls have been ordered to leave the fortifications where they have been staying. Richard T. Greener, the American commercial agent at Vladivostok, has left for Babarowsk. A Japanese force under General Hasegawa which landed a few

Map Showing the Present Position of the Russian and Japanese Forces in Manchuria

from Manchuria indicate that Field Marshal Oyama is preparing for a general attack all along the line, and it is possible that an important battle on land may precede the expected naval engagement. Both armies have been extensively reinforced and doubtless have all the supplies they need, for the railroad has been repaired by the Japanese and they have uninterrupted communication by rail to Niuchwang, and from that port to Japan by trans-

ports. The Japanese are advancing in three columns northeast along the railroad from Kaiyuan and Changtufu. The opposing Russian forces occupy strongly fortified positions extending across the railroad from the boundary of Mongolia 42 miles toward the east. There is also a Russian force still further to the east on the Tongta River, a branch of the Sungari joining that river at Kwanjir. This force is in command of General Patorilov, with head-

quarters at Hailung-Cheng, on the Tongta, about 70 miles southeast of Szepingkai, thus defending Kirin from the southwest. Between the Tongta River and the railroad there is a range of low mountains. The country north of Changtufu is hilly and deeply cut by ravines, therefore well adapted for defense. The spring rains are over and the roads are drying. Correspondents report that Harbin is the scene of riotous dissipation of Russian officers and men. Music halls and theaters are numerous and always crowded, and Monte Carlo is outdone in reckless gambling by this military camp. Vladivostok is being prepared to receive Admiral Rojestvensky's fleet and also to withstand an expected attack from land. All foreign consuls have been ordered to leave the fortifications where they have been staying. Richard T. Greener, the American commercial agent at Vladivostok, has left for Babarowsk. A Japanese force under General Hasegawa which landed a few

weeks ago at Gensan, on the eastern coast of Korea, is thought to be moving on Vladivostok. Russia has protested to the Powers against the arbitrary control of Korean affairs by the Japanese, who are managing all departments of the Government. The Emperor of Korea is reported to be about to visit Japan, and it is questioned whether this is voluntary or whether it is a scheme to get him out of the way.

# The Near Future of American Society

BY EDWARD ALSWORTH ROSS, PH.D.

PROFESSOR OF SOCIOLOGY IN THE UNIVERSITY OF NEBRASKA

OF all forms of error, says George Eliot, surely prophecy is the most gratuitous. Conscious of this truth, I aim in what follows not so much to anticipate coming events as to forecast the probable working, in the course of the next thirty years, of the mounting tendencies discernible under the surface of American society. Surely it is permitted to project a little the curve on which we are already traveling!

The sharpest corner American society has turned since the destruction of slavery was turned in the early nineties, when the last homestead in the rain belt was taken up. This event, more pregnant by far than the demonetization of silver, the McKinley Act, or the Battle of Manila Bay, closed the expansive free land epoch that has extended through our nascent period and ushered in the era of limited natural opportunities and intensive development.

The arrest of expansion in the late eighties and the early nineties was almost dramatic in its suddenness. In the five years ending 1884, if we may trust the figures of the Department of Agriculture, the average annual enlargement of our food bearing area was near seven million acres. In the five years following it was less than three million acres. In the succeeding ten years, 1889-1899, it was eight hundred thousand acres, and would have been a minus quantity had not millions of acres of meadow lands been plowed up. Between 1860 and 1890 the median point of cereal production moved west about 120 miles a decade, whereas during the nineties it migrated only 25 miles. During the seventies the median point of improved farm acreage moved west 131 miles, during the eighties 107 miles, during the nineties only 57 miles. During the nineties the center of population shifted west only 14 miles, as against 48 miles in the

eighties, 58 miles in the seventies and an average of 50 miles per decade during the first century of the Republic. In the last four census years the contribution of the farms to our domestic exports was respectively 92, 82, 73 and 60 per cent., showing the decline in the relative importance of agriculture as the extension of the crop bearing area slackens.

There is, to be sure, a great irrigable area, but its development will be slow and costly. This land, that costs upward of twenty dollars an acre to make fruitful, is not an opportunity for penniless families such as used to flow out upon Government land and achieve financial independence. Hitherto the discontented American has enjoyed an option—to move up or to move on. He can no longer move on and, as “room at the top!” is the gospel for the exceptional man, it is hard to escape the conclusion that for the ordinary man the circle of opportunities is relatively narrower. The superior man, on the other hand, finding in our commercial and manufacturing development a widening scope for the exercise of his powers, more and more differentiates himself economically and socially from the common sort. Population being more highly refracted by the economic *régime* of to-day, it is likely that the social spectrum will be lengthened.

Our population has always sloped westward, lying deep in the older sections and thinning out toward the sunset. But when the onrushing tide of migration broke into spray on the Hundredth Meridian, the viewless coast of the fertile expanse beyond the Mississippi, the backwash began to proportion population to the man-supporting power of the different sections. As West and South thus acquire their due quota of people, factories and cities will multiply in them, and the interchange of goods between crowded East and farming

West will become less exaggerated. The natural currents of exchange run between January lands and June lands, so we may look for North-and-South traffic to gain on East-and-West traffic. Consumers will spring up at the Western farmer's door and his surplus will go to feed American city populations rather than European. Home markets will diversify crops and the soil will no longer be worn out in growing only exportable staples like wheat, cotton and tobacco. Farming will become intensive and the unit of tillage will become smaller.

In the first half of the nineties three-fourths of our domestic exports were agricultural products; in the second half of the decade only two-thirds. As thus we come to seek outlets for our surplus manufactures rather than for our superfluous foodstuffs and raw materials we shall turn on our heel and address ourselves more to the under-developed countries of South America, Africa and the Orient. The gashing of the Panama Isthmus will hasten our industrialization and make the Pacific coast almost our front door.

Once the East with its ships and mills, the Center with its furnaces and forges, the South with its slave-worked plantations, the West with its farms and the Far West with its ranches and mines constituted so many distinct basins in which unlike types of society developed. Henceforth they will more and more merge into a single great national basin filled with one rich and highly diversified social life.

Steam massed people, but electricity is dispersing them. When the mechanic comes to think nothing of living ten miles from his work the slum will vanish and the city will diffuse itself into the country. Already telephones, free mail delivery and interurban trolley lines are revolutionizing the farmer's life. The sleeve of intercourse is polishing away rusticity, and ere long the comic papers will have one butt the less. The clodhopper and the cobble-trotter types are both doomed.

Nowhere will the spirit of association thrive so mightily in the course of the next thirty years as among wage-earners. Throughout wide areas of employment the individual bargain, with

underpayment and oppression in its train, will give place to the collective bargain, and the sellers of labor, equalized at last with the buyers in respect to bargaining power, will command approximately the true market worth of their services. Workingmen will associate, just as capitalists associate, under legally prescribed forms which standardize the constitution and practice of the best existing labor unions and duly safeguard the interests of the minority and of the individual member. Labor organizations, once outlawed, now tolerated, will eventually enjoy in law and in opinion equal rank with corporations as pillars of our society.

It is safe to predict that within our lifetime neither Kropotkin's Utopia nor Marx's will be realized. The half million establishments in this country will not fall into the maw of a collectivist State. Yet the State will bulk bigger than it does to-day and the net of regulation it casts over business will have a finer mesh. It is thinkable that certain strategic businesses—telegraph, railroad, insurance, coal mining—may, on account of their regulative influence, be taken over by Government. Certain it is a thick collision mat of administrative bureaus and commissions will be interposed to shield the public from the sharp corners and rough surfaces of the public service corporation. Boards will be charged with looking after banking, insurance, gas, electric lighting, street cars, mines, factories, railroads, shipping, tenements, elevators and stock exchanges. As corporate undertaking spreads and the army of shareholders swells to many times its present size, corporations will have to allow their inner workings to be radio-graphed upon the screen of publicity. Government will become a giant purveyor of exact and statistical information. As the taxable social product grows, philanthropy and education will be fostered with a more generous hand. The public onslaught on disease will develop from desultory bushwhacking into a vast scientific warfare, and State aid to research will reach proportions yet undreamed.

It is hard to say whether our two-party system will persist or will yield to a system of deals between parliamentary

groups, such as prevails in most European countries. Certain it is that the line of cleavage will shift. In our political history the clash of sections—manufacturing North and consuming South, lending East and borrowing West—has played a leading rôle. With the inevitable assimilation of sections and differentiation of society within each section class strife rather than sectional strife will become the substance of our politics. The party will become an alliance of definite social groups with kindred sympathies and interests.

The foundation of future party opposition will hardly be the feud of liberal and conservative, as in England; the clash of city and country, as in Germany, nor the antagonism of nationalism and State's rights, as formerly in this country. The political cleavage most natural to our next phase would give us one party championing a type of social union where (as in the trust) a man's title to consideration, weight and benefit depends upon the amount of his *property*, and another party standing for a type of social union where (as in the labor organization) a man's title to participate is his *manhood*. Capitalism and humanism—under whatever banners we battle politically in the future—this unavowed difference will lie at the bottom of our strife.

And what of the *soul* of the American people? What spiritual crises, what rebirths shall we look for?

The pivot fact in the moral life of a people is the reigning standard of human worth, for this fixes the shining goals toward which the ambitious press. A healthy community will grade its members by a composite standard that gives due weight to family, personality, character, prowess, culture and possessions. This standard we still apply to women, but for men the sheer money standard wrought out among heavy spenders has within recent years triumphed in our great cities and spread with alarming rapidity to the minor centers. Not a day passes but new communities and new interests surrender to commercialism. Yesterday the office, the sanctum, the club; to-day the pulpit, the studio, the laboratory; to-morrow, perhaps, the court of justice, the council

chamber, the Senate—such is the progress of the invasion. Naturally enough the result has been a whetting of greed and thereupon an unprecedented carnival of boodle, graft, fraud and monopoly extortion. Who among us has not felt the tug of this vicious undertow that is wrecking characters, setting adrift the old buoys and tearing the piling from under our free institutions?

This plague cannot last, for it is too deadly. Relief from Mammonism will come, however, not from a hallelujah revival, but from a revolution in opinion; not change of heart, but change in the standard of human worth. The coming standard will not be birth, for the old aristocratic principle is dead. It will not be prowess, for the sword arm cannot put itself in evidence now that war is passing away. Culture being *power to enjoy* rather than *power to do*, can never become the universal measure of worth in our hustle civilization. Character standing alone does not appeal strongly to the many and does not admit of easily discriminated degrees. The only graduated test of man's worth that can dispute the sway of the pecuniary standard, the test that is as congenial to our industrialism as prowess was to militancy, is *efficiency*. When to-morrow's morrow, graft-stricken and desperate, lights Diogenes' lamp and looks about for an honest man it will find him in the trained expert, fortified with a professional ethics, who next to a living for Molly and the babies cares for nothing so much as the "*Well done, old man!*" of his brother experts.

No Savonarola will uprear the new goal, but certain regenerative forces that are quietly gathering at the heart of society. Our crowded colleges are rearing a breed that will not dance before the golden calf, and from these centers most of the social leadership of the future is bound to come. From schools of engineering, business, journalism, social work and the public service moral ozone will spread into new quarters. Over against the dollar standard of success professional schools, associations and periodicals will raise the standard of workmanship. In the public service the trained sanitarian, statistician, accountant, teacher, engineer or warden will

oust the henchman. The mere vote-getter with his buncombe and make-believe will retreat before the business-like expert, bent on really doing the work for which he draws the wage.

Tho all who experience this antiseptic, professional training seem but a handful beside the votaries of Mammon, it is possible they will not be left to fight the battle alone. The toiling millions value men in terms of efficiency and instinctively pay homage to workmanlike traits. Hitherto they have been too unconscious and mute to have a hand in shaping the reigning standards of human worth. Their inertia, indeed, is not to be wondered at when we see even the active commercial section capitulate to the leisure class and blindly worship the tin-foil gods set up by idlers and pleasers. Now, however, the deeps begin to heave and stir. The great and growing movement of association among laboring men promises to release into society a purifying current of opinion. It may be that labor will not become sordid in proportion as it becomes successful. When, through fellowship and converse, the workers come to themselves, they will perhaps pluck up the courage to champion their own sound ideals against the guilt, swag-bellied idols of our day.

Free land gone, we shall soon see an end of the West, that buoyant society of the rising sap where opportunity is equal, ownership general, manhood at a premium, birth and station at a discount. The Westerner has always been "ismy" and radical. Again and again his individualistic and leveling impulses in the form of Jeffersonian and Jacksonian Democracy, Lincoln Republicanism, Grangerism, Populism and Bryanism have swept coastward and Americanized the crusting, stratifying East. The frontiersman thought of this country as the Atlantis of the poor, the Eden of the aspiring, free from class distinctions and the social power of wealth. The stealthy inroads of the transforming forces have therefore raised wave after wave of ire, protest and radicalism, which have rolled

over the startled East and broken its moorings to the Old World. With no longer this leavening West, whence shall we expect new avatars of the American spirit?

The social principles that now seem native to our soil—respect for the Divine in man, faith in moral forces, confidence in the rule of the many, democratic feeling—had their origin in a century of free and facile expansion over a fertile continent. With the dying away of this process the principles must lose something of their pristine vigor. The mounting influences of machinery, industrial organization, city life and economic differentiation cannot but assert themselves nakedly, and slowly assimilate us to the West-European societies, save as the traditions the past has lodged in our souls may hold us: Backwoods, prairie and placer bred notions of equality and freedom; mill, railroad and department store breed notions of hierarchy and discipline. For generations the reaction of successive receding Wests has borne us tangent to the Old World, making us ever more "American." Henceforth we are likely to obey the main current of Occidental development and move more nearly parallel to trans-Atlantic societies.

Free land, one of the twin mammæ of democracy, is well nigh dried up. But, tho the physical West passes, there is a spiritual West we shall never lose. From time to time appear freshening, emancipating spirits who spurn man-made distinctions of place, rank and money, and whose hearts leap toward every man as toward a brother. These are the prophets, the humanizing Isaiahs, Garrisons, Hugos and Tolstoys, who recall us to natural fellowship, who impress us with our likenesses even when conditions are exaggerating differences, who level us even when social terraces are rising. Of these there will be no lack. May this spiritual West that cannot dwindle perpetuate the institutions and ideals the physical West brought forth!

LINCOLN, NEB.

# The Resting Place of Paul Jones

BY PARK BENJAMIN

AUTHOR OF "THE HISTORY OF THE UNITED STATES NAVAL ACADEMY," ETC.

*"Ôu peut on être mieux qu' au sein de sa famille."*

THE characteristically prompt decision of the President that the remains of Commodore John Paul Jones, U. S. N., shall have their final resting place at Annapolis not only vastly pleases the Navy and all its friends, but

forestalls a controversy for the possession of the tomb, which the country can well do without. Jones was essentially a naval hero; and he belongs with his professional posterity and not elsewhere.

The issue now shifts from where his sepulchre is to be to what it ought to be. And this brings to the fore that particular

JOHN PAUL JONES.

*Paul Jones*

Bird's-Eye View of the United States Naval Academy Buildings, Showing Chapel as the Central Object

feature of the magnificent group of buildings now being erected for the United States Naval Academy which contemplates the establishment of a Naval Westminster Abbey, where the bodies of those men who have distinguished themselves upon the sea may rest, and admission to which may come to be regarded in the Navy as the highest of all attainable distinctions.

When the new Naval Academy is finished it will be the most magnificently housed institution of learning in the world. Dominating the entire group is the so-called "chapel," a time honored name, but now become rather inappro-

priate for a structure which holds more people than Trinity Church in New York and is to cost nearly half a million dollars. In the general photograph of the buildings here given, taken from the Severn River side, its dome, 200 feet high, is seen towering above all. Another photograph shows its present state of completion, the metal skeleton being in place and the walls well up, and from a third, made from the architect's model, an accurate idea of the majestic beauty of the *façade* may be obtained.

The plan has the form of a Greek cross with a large circle inscribed, so that there results a rotunda about 112 feet high and

The Naval Westminster Abbey at the United States Naval Academy, Annapolis. Completed Building

83 feet in diameter, which will be the chapel proper. Occupying the entire space below the floor is the crypt, a circular vaulted apartment 18 feet high and entirely unobstructed save for the heavy columns which support the vault arches. Around the circumference is a massive wall, in which are niches to serve as tombs. At the center, surrounded by the circle of inner supporting columns, it is

ment of the crypt and also the sketch, which will give a better idea of its interior than any merely verbal description.

It is further proposed to make the exterior ornamentation of the chapel conform to its employment as a monument to Jones. There are already large trophies of arms, standing on pedestals on the roof over the angle piers. The end of the nave which contains the main en-

The Naval Westminster Abbey at the United States Naval Academy, Showing Present State of Building

proposed that the sarcophagus of Commodore Jones shall be placed, in plain view upon a pedestal, with such of his battle flags and captured colors as we possess disposed around it. Access to the crypt is had by separate entrances and it is to be amply lighted by glass tiles set in the rotunda floor above. Mr. Ernest Flagg, the architect of the new Naval Academy, has kindly made for me the accompanying plan of the arrange-

trance and which, like the transepts and choir, projects from the circular wall of the rotunda, is crowned by a circular pediment. In the tympanum of this pediment, shown empty in the photograph of the model, it is designed to place a group of statues representing Jones on the deck of the "Bon Homme Richard" during her famous action with the "Serapis," and on the tablet in the frieze of the main entablature above the doorway is to be

Plan of Crypt Memorial Chapel, United States Naval Academy, Annapolis, Md.

engraved an inscription repeating his defiant "I have not begun to fight yet." In the main portal there is to be a superb pair of bronze doors, the gift of one of the best known of the Naval Academy graduates now in civil life, Col. Robert M. Thompson, of New York, to whom more than any one else the rebuilding of the institution is due, for he started the movement and carried it to success—and into the design of these some Paul Jones motive could perhaps be worked. Certainly no more impressive monument to any departed hero could well be devised than the Naval Academy Chapel will thus become should it finally be decided to carry into effect the proposals above briefly outlined. There is also the great advantage that it will certainly be completed and that it will not require any popular subscription whatever.

The question as to locality being now settled, an issue yet to be determined is whether or not Commodore Jones is justly entitled to the chief place among the men of the Navy to whom their country is willing to award this last and highest honor. This is a matter not to be hastily settled, least of all amid the shouting and tumult which will necessarily attend the reception of the remains from the fleet already deputed to bring them across the ocean. The claims of Farragut, of Decatur, of Preble, or if only the men of Revolutionary days are to be considered, then of that most gallant

fighter, Nicholas Biddle, are all justly to be weighed. It must be remembered that Jones has constantly been dealt with in the language of hyperbole. Charged with all the crimes in the calendar and habitually styled pirate and renegade by his enemies, he has been equally the object of indiscriminate eulogy and superlative glorification by his indignant friends. After the War of 1812 the attacks on him by British writers broke out anew, and probably the bitterest of all were written when the last century was twenty years advanced. The recriminations and laudations were then resumed with increased vigor on this side of the Atlantic, and so the last two generations of Americans have been taught from their cradles to regard Jones as a sea Bayard *sans peur et sans reproche*—mainly by biographers who, however clearly, especially of late years, they may have perceived the facts, evidently have had no relish for the unpopularity which might possibly follow any attempted disturbance of the general conviction. A just appreciation of his deeds and character lies, of course, between the extremes. That he was a regularly commissioned Captain in the Navy of the United States and no pirate his former foes now willingly admit. The vast fleets of England and France had confronted one another for centuries, but no French captain had crossed the narrow strait and thrashed an English

View in Crypt Memorial Chapel, United States Naval Academy, Annapolis, Md.

frigate in an English harbor and sailed her a prize to France, nor forced another to strike her flag in sight of her own shores, and this with a sinking ship, which went to the bottom almost before the victorious crew could take possession of their capture. These things Jones did, and whatever may be said as to the military value of his achievements the

moral effect of them upon the French court helped the fortunes of the young Republic. None the less there is work for an *advocatus diaboli*—and there are strong arguments which he may urge against according to Jones any such primacy as the central place in the crypt betokens.

NEW YORK CITY.

## The Civic Value of Hartford's Four Hundred College Graduates

BY EDWARD PORRITT

[Our readers have long been familiar with Mr. Porritt's articles in *THE INDEPENDENT*, and they will be interested to know that he has recently become a citizen of the United States. This article is suggested, of course, by the different way things are done in English cities with whose political and social activities Mr. Porritt is familiar, as his books, "The Englishman at Home" and "The History of the Unreformed House of Commons," attest. Our readers will find Mr. Clark's article, which follows, as interesting and positive as Mr. Porritt's.—EDITOR.]

THERE are two obvious reasons why Hartford ought to be in the same class as Cambridge and Brookline among the well-governed cities of the United States. There is the influence of its three hundred Yale graduates; and there is its beauty and the beauty of its natural surroundings, which should evoke civic pride and bring home to Hartford citizens an abiding and stirring realization of the fact that the city is the larger home.

If Hartford cannot inspire this feeling of the larger home there is no city in the New or Old World that can; for surely in the Anglo-Saxon world there is no city—not exclusively residential—which has in a greater degree than Hartford everything that goes to the making of a beautiful city. All the beauty that makes the Connecticut Valley a joy is exemplified in the surroundings of Hartford; and in fine streets, stately avenues and magnificent parks, art has added to the natural charms of the Connecticut capital city.

Hartford's associations and scenery should arouse and keep alive a strong and active civic pride, and, as I have already suggested, there is another reason why Hartford in all that concerns a good and

progressive municipal life should easily rank with Brookline and Cambridge.

There are in Hartford not less than three hundred graduates of Yale. Other universities and colleges are also represented, and by a moderate estimate there must be at least four hundred college graduates of the voting population, to say nothing of the graduates of women's colleges, who are as numerous in Hartford as in any city of its size, but who are excluded (to my mind, unfortunately) from all part in its municipal life.

If the college spirit—the spirit which nowadays is supposed to make for good citizenship and clean politics—counts for anything anywhere, it ought surely to tell enormously in Hartford; for while there are more college graduates in cities such as New York, Philadelphia and Boston, those cities have not the self-containedness or homogeneity of Hartford; and under metropolitan conditions neighborhood feeling cannot be expected to have the same beneficent influence that it has in a city with under one hundred thousand population.

The college spirit and the leadership in public life that college training is now regarded as giving to college men ought

for these reasons to be exemplified and obvious in the State of which Hartford is the capital, and they ought to be especially visible in municipal life in Hartford. Yet the most enthusiastic admirers of Hartford (and I want to be understood as grouping myself with them) cannot claim that as regards municipal life Hartford even approximates to Cambridge or Brookline; and as concerns municipal conditions, it would, I think, be difficult to point to any advantages or permanent results, except perhaps in part as regards some of the schools, the libraries and the parks, which have directly accrued from the civic spirit of the three hundred and fifty or four hundred college graduates who do business in Hartford and make their homes within its borders or in its beautiful suburbs.

If a stranger were to come to Hartford he would at once be confronted with the gloomiest and ugliest evidence—evidence which he could not escape unless he were led blindfold through the city—that the college spirit counts for little on the

moral and esthetic side of the city's life. He would be confronted with a huge advertisement—an advertisement as large as the front of a three-storied house—which suggests one glass more, "That's all," of somebody's whisky, for a leering, blear-eyed, disreputable and boozy rounder in decent clothes, who from the way the sign-board artist has treated him is already mellow, and abundantly ripe for the patrol wagon and detention in some Keeley cure establishment for the rest of his natural life.

This disgraceful pictorial advertisement is on the roof of the most central business block in the city—on a block which is locally known by a good New England name. It dominates the heart of the city; and altho it vulgarizes the building on which it stands, vulgarizes the name associated with the building, vulgarizes the stores below, is irritating to the self-respect and good feeling of all who must pass that way, and, moreover, vulgarizes and spoils a magnificent street, which would do credit to such

The Advertisement

classic cities as Edinburgh or Oxford, this advertisement has been kept there not for a couple of months, but for a couple of years, and nobody knows how much longer Hartford must tolerate it.

Notwithstanding Hartford's four hundred university graduates, and the graduates of the women's colleges in addition, nothing practical has been done concerning "The Sign of the Boozee." It has never been suggested to the Board of Fire Commissioners that it was a danger to the fire brigade. It has never occurred to the Police Commissioners that it is a danger to the public peace, as it might be provocative of riot by outraged citizens. It has never occurred to the City Council, nor to the Mayor, who is a Princeton graduate and a lawyer, that it could be treated as a nuisance; and the 1905 session of the Legislature is being allowed to run its course without the suggestion of an act to safeguard Hartford and all other Connecticut cities from such wanton outrages on public decency and civic pride.

At alumni banquets the Yale spirit is a great force. But it is not worth shucks if it does not get beyond banquet halls and count for something in civic life.

Until I spent a few days at Brookline looking into municipal conditions there, I had a feeling that it was hopeless to expect much in the way of civic development and achievement in a city governed as Hartford is; for Hartford city government is so complex that I do not pretend to understand it. I have mastered the ins and outs of municipal government in England, Scotland and Ireland—both the systems that prevailed before the great municipal reforms of the thirties and those which have come into existence since then. But I never was confronted with a harder problem in municipal government than that of Hartford. There is a board of selectmen, a municipal body with two chambers, and a board of commissioners for this and another board of commissioners for that, also a city attorney; while as regards the schools, they are still under the old district system, and each district proceeds in a go-as-you-please style, without regard to equality of educational

opportunity for all the children of the city.

I did not expect much municipal achievement in Hartford. I did not see how it was possible under such a complex and antiquated municipal system. But at Brookline I discovered that the old New England system of town government survives in its integrity. Off-hand it might be said that this system is not adapted to modern municipal demands. Theoretically this may be true; but conditions in Brookline convince me that it matters little what is the actual plan of municipal government, and that everything depends on the spirit which is behind the government.

Brookline citizens exercise great care in the choice of their selectmen; then they loyally support them and take an active interest in their work; and the result is that Brookline to-day ranks with any of the most progressive and best administered municipalities in England. Evidently there is a Brookline spirit, and it is a spirit of untold value in civic administration. Whether it is the Harvard spirit I am unable to say; but it is a matter of common knowledge that it is the Harvard spirit that has given Cambridge the proud place it has so long held among New England municipalities.

Civic achievement of a high order is hardly to be expected from a common council which, like that of Hartford, is divided into two chambers—a council and a board of aldermen; for this confusing and useless two-chamber plan was copied from English municipal systems when they were at their worst. Except in the city of London, where municipal government is still in organization much what it was in the eighteenth century, the two-chamber plan has nowhere survived in Great Britain after the sweeping municipal reforms of seventy years ago. It disappeared without any popular regret; and, altho there are councillors and aldermen, both groups sit together, and procedure in municipal government is simple in the extreme as compared with procedure in Hartford. In England a boy who has passed the sixth standard can follow from the newspaper reports the proceedings of a municipal council.

In Hartford it seems to me to need years of training to follow what is being done—to understand where among Mayor, selectmen, councilmen, aldermen and commissioners responsibility and initiative really rest.

I sometimes think that Hartford's municipal authorities themselves do not always know where the initiative in any movement actually lies. If they did there would not be such hesitancy and failure to move in important matters as have marked the last few months. "The Sign of the Boozee" is one such instance, and I will quote two more where failure to move in the civic interests of Hartford has been equally marked:

A little while ago a seizing, holding, and squeezing company from New Jersey or elsewhere, moved on to Hartford's gas house; and the usual tactics of seizing, holding and squeezing companies came into play. These gas house exploiters had occasion during this session to appear before the Legislature in connection with two bills. One was a hostile measure, to regulate their extortionate meter charges; the other was to authorize the exploiters to issue bonds. In neither instance has there been an appearance for the city of Hartford, either to regulate the company's gas charges or to secure clauses in the bond issue bill to safeguard the city in the event of municipal ownership, which sooner or later must come.

The Consolidated Railway Company is also before the Legislature asking for comprehensive and innovating additions to its powers. It has had the audacity to ask that it shall have power to double-track street car lines in the city of Hartford and other Connecticut cities without the permission of the city councils. Connecticut people are accustomed to the demands of the Consolidated. It is of the Hartford Catechism as formulated by the local press, that its citizens "shall revere the Consolidated, and think no evil of the Gas Company;" and revering the Consolidated is so ingrained in Connecticut life and thought that if the Consolidated asked permission to move its headquarters from New Haven to the State House, the Legislature might grant even this privilege with alacrity, provided the Consolidated in governing the State would

pledge itself not to reform the Legislature nor to deprive it of the privilege of electing United States Senators. However this may be, the Consolidated's demand to over-ride the city councils in the matter of double-tracking car lines has provoked no popular outburst in Hartford, and as yet the city council is not on record as offering any opposition to this audacious proposal.

It is, it seems to me, difficult to realize and follow intelligently what the city council and the half dozen boards of commissioners, plus the selectmen, the Mayor and the dozen or more of school committees, are doing. It must be conceded also that it is possible to elect only a few Yale men to the city council. But if the study of law, economics and citizenship at Yale amounts to anything, and if the Yale spirit is really an active force for good, Yale men and other universitymen in Hartford ought to have been heard from in connection with the affairs of both the seizing, holding, and squeezing gas company, and the astounding proposition of the Consolidated with regard to the city streets.

Hartford lacks a decent post office service. It has a postal service so poor that it would not be tolerated in any English cross-roads settlement with a church, ten cottages and a fully licensed public house. People who live a mile away from the center of the city are practically blackmailed by the telegraphic companies. These companies accept business at the usual tariff at their outlying branch offices; but they charge twenty cents as portage for all messages delivered within the territories served for outward business by these branch offices. Hartford has no public baths. Its city hall is an architectural treasure, but long inadequate to present day needs. Its school system—separately elected committees for each of its public schools—has little to commend it, except that it is just the system Hartford had A. D. 1670 or thereabouts. Hartford's outlying regions—regions still within the city boundaries—lack any consistent plan for the laying out of new streets. Every landowner seems to do as he likes; to divide his land so as to give most frontages, without any regard as to what kind of a street will be the result or how the

street will fit in with the streets and avenues with which it will connect. Any architectural monstrosity that a speculative builder conceives will find a purchaser is allowed to go up; and generally in these and other matters, such, for instance, as street cleaning when the ice and snow are going, there is a lack of a broad, civic spirit—of any continuous care for the city as the larger home, such as might be expected if the college spirit of which so much is heard at alumni banquets was of any potency in civic life.

With the State Capitol in Hartford it might be conceived that the college spirit would make itself felt in the life of Connecticut; for the State is again only the larger home. But all the world knows what has happened in 1905 to Connecticut. It has been put in line with Delaware; and most newspaper readers know that the prime mover in this degradation of Connecticut to the Senatorial level of that other unfortunate State, which has had to put up with so much notoriety from Gas Addicks, the man in whose interest it has been done, who has gained his end by this disgrace to Connecticut, has received an honorary degree from Yale and is usually prominent at banquets in Hartford when the Yale spirit is extolled.

Turn up the Hartford newspapers of the days immediately following the late Senatorial election. Look at the scores of letters and telegrams which poured in on the self-created Senator. Then look up a Yale calendar, and see how many names of Yale graduates are appended to these fulsome and nauseating congratulations.

It should be remembered also that the only Hartford newspaper of any pretense to civic value supported Bulkeley, and that it is controlled and edited by a Yale graduate of State-wide distinction.

Again, watch the reports of proceedings before committees of the Legislature when the Consolidated Company or some other well-intrenched monopoly or vested interest trading in public utilities is out for favors for itself or would block some competing company which in the public interest ought to have a right of way. Note the names of the counsel for these aggressive vested interests, and

again turn up the Yale calendar. Five times out of six it is a Yale graduate who has been hired for this corporation service. Yale, too, is prominent among the lawyers who do the lobbying for these concerns.

The chances also are that when there is a bill before the Legislature to shorten hours of labor in factories—to bring them down from sixty a week to the level of Massachusetts and other of the progressive American States—lawyers who proudly point to Yale as their Alma Mater, and who never miss an alumni banquet, are there as hired advocates to kill off in committee a measure which is based on popular demand and humane considerations.

Again, when there is a bill to get rid of the doctrine of common employment so that the Consolidated Railroad Company and the other great industrial concerns of Connecticut shall make some compensation in respect of the men in their service who are killed or maimed—a bill to provide that the casualties of industry shall be a recognized charge on industry, as they are in Great Britain—Yale lawyers almost invariably voice the vigorous and persistent opposition of the Consolidated, which employs 35,000 men, and is the controlling and dominating industrial interest in Connecticut. As far as my reading of the Hartford newspapers goes, and it extends back to 1892, it is Yale lawyers who speak and lobby against every bill before the State Legislature which would abolish this doctrine of common employment in workmen's compensation cases—a doctrine which under present industrial conditions and present day social tendencies is as inhuman, as brutal, and as much out of date as the old slave codes of the Carolinas or Virginia.

Lawyers in any country and at any time seldom range themselves with progressive forces. Perhaps it is expecting too much, even of the Yale spirit, that lawyers who are of Yale should lead in any forward movement in Connecticut. All college graduates in Hartford are, however, not of the Bar; and if the Yale spirit really actuated these men toward right and justice, progress, fairer conditions between man and man and wholesome conditions generally in the larger

home, the Yale graduates who are not lawyers and cannot be hoping to be retained by the great vested interests could surely count for something in bettering industrial conditions and raising the level of civic life and State politics.

Only yesterday I received a postal card from some unknown source asking me to vote "No" on the consolidation of school districts at the city elections, in order to "keep our schools out of politics." There is scarcely a day when I do not hear, or read the remark in the Hartford newspapers, that this or that interest or question must be kept out of politics. The oft-reiteration of this saying is in itself proof to me that the college spirit and influence as yet counts for nothing practical in clean politics and good government in Hartford and Connecticut. It is an allegation or an admission of untrustworthiness and rottenness among those who are responsible for Hartford and Connecticut politics—for the administration of the affairs of the larger home.

It should be remembered, however, whenever this disagreeable saying is used in Hartford or elsewhere, that corruption in politics all the world over, and in every period of the world's history, comes not from below—not from the rank and file of democracy, not from the poor and the ignorant—but from above, from the well-to-do, and usually from the educated. It was always so in England. If there had been no lawyers eager to be of the House of Commons, no courtiers also eager to go there, and no landed aristocrats anxious to control Parliamentary representation—if these had all been lacking in the sixteenth and seventeenth centuries, and had continued lacking, there would have been no need for the Parliamentary Reform Act of 1832, for the act which immediately fol-

lowed for the reform of the municipal corporations, nor for the comprehensive, far-reaching and drastic corrupt practices act of 1883.

It is much the same story in this country; and it is certainly the same in Hartford and Connecticut. If there had been no "best people," eager to bribe, Bulkeleyism could never have become rampant; and in Hartford there would be no dread lest by consolidating school districts and equalizing educational opportunities the public schools should get into politics. If my conception of the larger home is right, in politics is where the public schools really belong; for politics to my mind are the affairs of the larger home.

There are, if I am correctly informed, Yale graduates in Hartford who can lay their hands on the "best people" who are responsible for this corruption from above, who can tell whence come the funds with which newly naturalized voters on the East Side are bribed at city elections and also the sources of the \$150,000 which debauched so many of the smaller rural towns of Connecticut at the State elections last fall. But Yale men in Hartford do not point out these offenders. They tumble over each other in their haste to get congratulatory telegrams on the wire when the nefarious schemes of these "best people" succeed, and take a delight in seeing their letters of congratulation in the public prints.

So long as Yale men thus acquiesce in existing conditions and fail to show any disposition to work for better things, so long will the university and college spirit count for little that is practicable or obvious in the way of a higher civic life and a more wholesome atmosphere in Connecticut State politics.

HARTFORD, CONN.

# Hartford Defended

BY CHARLES HOPKINS CLARK

EDITOR OF THE HARTFORD COURANT

I AM a native of Hartford and a graduate of Yale, and take a genuine pride in both facts, altho I realize that I was in no way responsible for the first, and that, while I did graduate from Yale in 1871, I couldn't do it now in 1905. Nevertheless the pride is there, and naturally I resent an adverse criticism either of my home or my alma mater, and doubly a criticism that groups and condemns them both.

I want to reply to Mr. Porritt's several indictments before giving myself the pleasure of taking up the larger and welcome subject of the public spirit of Hartford and Hartford citizens, whether college men or not.

(1) Women are not "excluded from all part in its (Hartford's) municipal life." A fictitious and in some respects amusing agitation some time ago pushed "the reform against nature" so far as to secure women's suffrage in school matters in this State. But it wasn't wanted, hasn't been used enough to acquire respect, and is admitted to be a farce. At the recent Hartford city election in April, when a very important school question was before the public, less than 100 women out of a total of at least 18,000 of voting age in the city went to the polls. But when it comes to women in affairs, the Hartford Public Library is presided over by Miss Hewins, who is one of our most useful citizens; the Good Will Club, which has kept thousands of street boys out of mischief and made fine men of many of them, is managed by Miss Mary Hall, who organized and developed it and is its mainstay; the Union for Home Work, whose wise charity has for years been relieving sufferers and encouraging the unfortunate to self help, is conducted by Mrs. E. L. Sluyter, its moving spirit, a ministering angel in the whole community; and in our public schools many noble women have done and are doing immeasurable good. Then

there are numerous clubs of women who meet and discuss public affairs with no idea that they are "excluded," except in the case of one club that is organized simply to discuss that exclusion. Hartford owes much to its women and is proud to be thus indebted.

(2) It is true that a big whisky sign has been placed on the top of a central building, as has been done in various cities. There has been considerable and very proper indignation about this. Protests have been made and still the sign stands. The reason for this is that there is no lawful way to secure its removal. It is absurd to class the thing as a nuisance within the meaning of the law or as a public peril; and, if it is not that, then there is no power to attack it. The city government is helpless, and, lawyers say, the Legislature can pass no effective law. It would require a constitutional amendment, and a curious one, to reach the case, for the rights that keep it intact are a treasured element in our personal liberty. The contracting parties, the land-owner and the whisky advertiser, are within their rights. "That's all," as the letters themselves read.

(3) Mr. Porritt is absolutely astray when he says the Consolidated Railway Company is asking the right to double-track the car lines in our streets "without permission of the City Council." No corporation can do more than its charter permits. This company has absorbed smaller ones and some of these are by charter limited to single tracks. They could not lay a second one if the local authorities granted the privilege. The Consolidated is simply asking the right, and this right under existing statutes is subject always to the consent of the local authorities. The case is exactly contrary to Mr. Porritt's statements. He simply doesn't know the law. That may be excusable, but, not knowing it, he certainly should know better than to be

led astray by "legislative strikers," who try to cultivate a spirit of hostility to the Consolidated because they cannot get pay to work for it, and whose trouble-making strength lies in being able to get a following of well meaning zealots. Time was when the great railroad hired a small army of lobbyists, bought every venal legislator and made others venal who did not start so, and was the source and inspiration of political corruption. That time, it is believed, has gone by, but it is said the present managers find it harder to get reasonable things decently than their predecessors did to get unreasonable things corruptly. Such an attack as Mr. Porritt makes in the name of public spirit and good government is another argument for those of the "practical" turn of mind, who contend that it is useless for a great corporation to be decent, that people do not expect or believe that it will be, and that the only way to manage it is to buy what you want, pay for it and get it.

(4) I cannot at all understand the gas reference. I think I am within bounds in saying that the old Hartford Gas Company was one of the most unpopular institutions in the city. When the new management secured control it was welcomed on all sides. Its subsequent attempts at extortion have been attacked by the newspapers and by committees of citizens, and it has been forced to modify largely the unjust and aggravating rule that it arbitrarily established. Where in the world the gospel of "Revere the Consolidated and think no evil of the Gas Company" came from is beyond me. "Hit 'em both—they're rich," is a more general doctrine.

(5) Hartford has no more to do with its post office than with its Adams Express office. The postal business here has grown enormously, the clerical force provided to do the work is insufficient, the building (now being enlarged) is utterly inadequate to the demands upon it. No one questions that the office falls short of what we want it to do, but that is not the fault of Hartford, but its misfortune.

(6) I have observed that men work for those who pay them the best wages. Teachers and lecturers distribute their wisdom where they can get the most for

its delivery. Even clergymen see the hand of the Lord in the bigger salary. Lawyers, whether from Yale or from elsewhere, sell their services to the clients that pay them best, and the big corporations get the pick of the talent. It is not for me to defend the ethics of the legal profession. There are lawyers who can do that better—perhaps with more enthusiasm—but all that Mr. Porritt's reference to lawyers in Connecticut comes to is that they are like others of their profession and the best are found on the side that can afford to pay them.

(7) Readers of THE INDEPENDENT do not care for any elucidation of our form of city government; we here understand it and any one who desires to can easily master its details. Its results are a peaceful, progressive city, free from scandals in administration. The scheme is not a model, it could advantageously be recast, but it is no discredit. And as for consolidation of schools, our district management is "politics." The little district meeting is open to all voters and has full control of school affairs. It is all we have left of the old town meeting. The objections to consolidation are not political, but legal and material—the adjustment of debts, ownership of property and so on. The people of the city do favor an even cost of education all over town, and a bill carrying us a long way in that direction will probably pass at this session of the Legislature.

So much for every point raised except that which refers to Senator Bulkeley. He is a successful business man, identified with many of our largest and most honorably conducted concerns, is of unquestioned and long established personal popularity, and if the people of the State themselves had voted for United States Senator last January, at an election where not a dollar was spent by anybody, he would have been in the first half dozen when the votes were counted, and probably in the first half of that half dozen.

So it is the fact that:

We have some woman suffrage and even that is not wanted.

The Constitution is bigger than the whisky sign.

The Consolidated isn't asking for leave

to lay tracks without city permission.

The Gas Company was called down and compelled to modify its rules.

The Post Office is regulated from Washington, not from Hartford.

Lawyers are lawyers wherever found, and usually human at that.

The form of our city government isn't so important as the results; these are fairly good and noticeably clean.

So much for the specifications of the indictment, and perhaps it might do to leave the case there, but simply to review the particular charges which have been made seems a very inadequate vindication for a city which is not and has no reason to be in a defensive attitude. In Hartford, out of about 90,000 inhabitants, there are about 300 Yale graduates; in the State, with, say, 1,000,000 people, there are about 2,600. How many graduates there are from other colleges statistics do not show. If State and city did lack public spirit it would be fair to hold the college men largely responsible, but it would be unfair to the great majority of the people, and so encourage a prejudice which has no real foundation, if one were to assume that, because public spirit does abound and because this is one of the best places in the country to live in, the credit lies with the small band of university men who live here. They have benefited enough by their college education and their experience of life to feel the utter absurdity of such an assumption. No one can name the foremost dozen men of Hartford or the State and leave out all college graduates, but no one can make the list up entirely of college men and not make himself ridiculous.

Public spirit is the birthright of Hartford. Here the first Constitution was adopted; here the charter was hid in the oak; here the constitutional convention was held in 1818; here men like Hooker, Stone, Bushnell, Burton, Walker, Parker, Twichell have preached a gospel of progressive citizenship, which has been reflected in the history of the town and State.

It may be called a sordid view to measure public spirit by dollars, but it is certainly suggestive that Hartford gave \$1,100,000 toward the construction of the State Capitol, put \$1,250,000 into

the construction of two railroads—and it is in there yet—and is now expending about \$3,000,000 for a stone bridge of lasting beauty across the Connecticut, while an ugly one of iron could have been built for a third of that sum. A system of parks of unsurpassed beauty lies all around the city, many of these the gifts of private citizens.

As to business, our great insurance companies, paying all losses, however great the strain upon their resources, are proverbial for honorable dealing and for wise and farseeing management, and what our great manufactories produce is recognized everywhere as the best of its kind.

Our educational institutions stand deservedly high. The need for a public library became so evident in 1890 that private citizens subscribed over \$400,000 for it, and now the municipality pays \$12,000 a year for its maintenance. Work on a small scale among the street boys was so successful that a fund of about \$60,000 was raised by private individuals to put the enterprise on a permanent footing, and there it is. Intelligent work among the poor is conducted at private expense with the best of public results. The City Hospital has received more than half a million dollars in public endowments, and its recurring deficiencies have been promptly made up by public subscription. Bring out a good cause; the people of Hartford will do the rest.

What is public spirit? Is it chronic dyspepsia and its expression in perpetual faultfinding? People who are all the time looking for trouble are disappointed if they miss it and unhappy if they find it, and never satisfied. Other parts of the State point to Hartford as a singularly public spirited community, and any one who knows the State, studies its legislation and familiarizes himself with its history knows that Connecticut has never been found lacking in public spirit when put to the test.

University men have been and are taking their full share of the work as citizens. The idea that they are the leaven that leaveneth the whole lump and that without them everything would go down, and the idea that those who have not been to college sit around to

see what the college men will do and then try their little best to imitate them, irritates everybody when it happens occasionally to be exploited, and mortifies and puts at a disadvantage the very element that it is supposed to exalt. In Hartford there are "educated" shirks and "uneducated" shirks, as there are in other cities, but to a very large degree all hands work together here. The argument that a man is "educated" and therefore should be put forward, and the argument that he is not "educated" and therefore is "one of the people" and

should be put forward, have each been tried and both failed. The question is what a man is and what he can do, and its answer places him.

In material development and the morale of its business life, in works of judicious philanthropy and practical charity, in opportunities for study and cultivation, in the liberality of its people both in act and in opinion, and in the whole wide range of things that go to make a place desirable as a home Hartford is willing to be compared with any other city in the country.

HARTFORD, CONN.

## Is Man the End of Evolution?

BY SAMUEL W. WILLISTON, M.D., PH.D.

PROFESSOR OF PALEONTOLOGY IN THE UNIVERSITY OF CHICAGO

[A short time ago the daily papers published a very sensational article, ascribing to Professor Williston the statement that man would ultimately be beaten in the struggle for existence by the birds, which would be the final inhabitants of this planet. As a corrective of these exaggerated reports we have obtained from Professor Williston this expression of his views as to the future evolution of animal life. He is one of the foremost authorities of the world on saurians and early birds, and can speak with as much confidence as any one can on such a doubtful point as this.—EDITOR.]

THE interminable struggle for existence among living organisms always has been and yet is the basic law of progress. Because of it the weaker individual, the weaker race, is relentlessly forced to give way to the stronger, the more vigorous, the more unapproachable type. The better survives and the best is never reached; nothing is permanent. We may assume that this law is inviolable, in material things at least, and that, so long as life lasts upon the globe there will be no cessation, no peace, however much the law may be modified.

There are living upon the earth at the present time less than three thousand species of the great class of vertebrates which we call mammals. More than forty-five hundred extinct species of the same class have already been cataloged, and since nearly one-half of this number have been discovered within the past twenty-five years, one-third indeed within the boundaries of the Argentine Re-

public alone, we may confidently expect that twice or thrice that number will be made known in the immediate future, and all these even will be but a fraction of the great numbers which have lived and perished in the past. If we estimate very conservatively that there are now in existence upon the earth two millions or more distinct species of animals and plants, we may, without doing violence to sobriety, place the number of forms which have lived and become extinct in the past at twenty millions or more; indeed, were we to say forty millions we doubtless would come much nearer the truth. Faunas and floras have been repeatedly swept away to be replaced by new ones, and always, upon the whole, by ones of higher rank.

The very meaning of evolution is that the sum total of specializations in living organisms progressively increases from year to year, from age to age; and such, indeed, has been true so far and well as we have traced life through the millions

of years of the past. We have not yet reached the beginnings of this history; we probably never shall. We have not had a glimpse even of the first part of the volume, of the first half perhaps, but we may confidently believe that such of the history as we have read teaches no different lessons than would that unknown part were some good fortune to unseal its pages to us.

To say that evolution is the law of progress is but to say that the early forms of life were generalized forms, potential forms, having within them the possibilities of higher development. In the border village of fifty years ago the artisan did many things equally well and equally poorly. But he had within him the possibility of higher things; with increased competition he became a specialist, doing fewer things, but doing them better. But he still has as much to fear from competition as ever, for there are now many other specialists of his kind. The earliest true vertebrates, the fishes, were all potential forms; unthinkingly we might even say that some of the earlier ones were higher forms than those which succeeded them, forgetting that specialization is merely the closer adaptation of an organism to those conditions in life which go to make up the well-being of the species, tho not necessarily of the individual. Some of these early fishes breathed air in part, as do a few of their descendants now living, and doubtless gave origin to the great class of amphibians. But the fishes, for the most part, went on into a greater specialization as purely aquatic animals, peculiarly fitting them for those places in life which offered the greater opportunities. They are to-day, so far as numbers and varieties are concerned, perhaps the dominant type of vertebrate life. Those which were left behind found neither avenue of freedom open to them, the land or the sea, and they have at last nearly succumbed, only a few hundred kinds being left among the thousands of their relatives. And the history of all succeeding vertebrate life has been a repetition of that of the fishes, tho to some, as the amphibians and the reptiles, fate has seemed less kind. From the early amphibians, long ago, in Paleozoic times, there arose a branch, a very split-

table branch, if I may use such an expression—that is, a very potential branch—the reptiles, which very soon divided into many groups, the most of which sooner or later rose to prominence, only to disappear forever. Of the fifteen or twenty main divisions of these animals only four or five have survived, and some of these are decadent.

Soon after the birth of the reptiles and from their more potential types there arose the two classes we call birds and mammals, which the earlier of the two we do not know, and from these early forms, still potential types, but with possibilities of larger things than specialization seemingly had left to the reptiles or fishes, have come the dominant forms of later times. Not all at once. While birds and mammals were still potentialities, still generalized and lowly, the reptiles had become actualities, in the air, the sea and upon land, and, through long millions of years they had to await their turn, gradually gathering strength for the contest for final supremacy. Their potentiality was greater, because it included intellectuality, and intellectuality, other things being equal, always has conquered and always will conquer.

High specialization, then, has been a factor in the extinction of the many animals of the past. Not over-specialization as an organism—for such over-specialization must mean the acquirement of organs and functions of no use to the species, an improbability, to say the least—but that over-specialization which limits too closely the sphere of activities, or prevents the possibility of adaptation to new environments, or that one-sided specialization which weakens the reproductive energies. That peculiar skill which made in olden days the stage driver best fitted for his work, best fitted to compete with others of like vocation, especially unfitted him for the vocation of a locomotive engineer. Stephenson's Rocket was a potentiality which has driven out or will eventually drive out the stage.

That high specialization has not proceeded with equal step is also apparent. The turtles, tho highly specialized reptiles, have remained for long ages with but little change, even as the bookmaker's art has remained materially unmodified

by the turmoil of modern life since the time of Guttenberg. Branches have gone from the turtles, it is true, seeking greater freedom, but coming to grief after brief seasons of mighty power, as exemplified by the monstrous sea-turtles of the later Mesozoic, animals measuring twelve feet across the shells. The lowly lizards, after waiting since Triassic times, have now acquired a dominant position among the reptiles for themselves and their descendants, and, like the bony fishes, will in much probability soon be the only representatives of their class upon the earth.

As a corollary to the fact that high specialization has inevitably led, directly or indirectly, sooner or later, to the extinction of the species is also the fact that, other things being equal, high specialization means a briefer existence for the genus, the species, and, possibly, for the individual. Certain individual reptiles have been known to live more than one hundred and fifty years, and a goose even has a greater span of life than has a man. Among the invertebrates perhaps the longest known life of any species is that of the brachiopod *Leptena rhomboidalis*, which began in the Ordovician and ended in the Carboniferous, a long span as we measure time, tho of only respectable geological longevity. But there is no such example of longevity among vertebrates, and briefest of all was the geological range of the higher mammals of the past. No living species of mammal is known to reach back of the Pleistocene, and no genus goes further than the Miocene, in all probability. This fact, the briefer duration in time of the higher vertebrates, is well understood by geologists, a fact often enunciated by the late Professor Marsh. It is because of this brief duration and restricted distribution of such species and genera that the testimony furnished by their remains in the rocks is so conclusive as to the age of the strata containing them.

A living organism finds relative peace only in so far as it can adapt itself closely to its peculiar environments. In the natural course of events it must, because of the unstable equilibrium of nature, be constantly confronted with impending dangers, and for all other creatures, as

for us, eternal vigilance is the price of liberty. If it cannot flee from those dangers it must meet them; if it is strong and powerful it will resist for a longer or shorter period, and perhaps conquer. But in the end it must adapt itself to those which it cannot conquer, or "go out of business." Were the glaciers again to come suddenly from the north far to the south, a tortoise or a snake must be driven to perish in the gulf, but a pigeon finds safety in flight across the waters, and a rabbit takes on a warmer pelage and burrows in the snow.

A species, then, like an individual, finds safety in adaptation to new conditions, just so long as it is possible, just so long as it is itself plastic. But you cannot teach an old dog new tricks, and the species must eventually become extinct, like the individual, tho it may have given off progeny capable of other things.

Were physical conditions absolutely fixed, were light, heat and moisture absolutely unchangeable, following each other with mathematical precision and in unvarying quantities, it might be assumed that the equilibrium of all nature would follow, and evolution cease. Possibly under the Agassizian view of multiple creation such a condition of stability under fixed conditions would be a corollary. But I cannot believe, nor do I think that any naturalist can, that were such fixed environmental conditions suddenly to become operative organic nature would become stable. There are hereditary influences at work, the accumulation of forces which have acted through past ages, physiologic forces, which affect more or less profoundly the action of environmental conditions. Birth, growth, decay and death are the inherent attributes of the individual, and I believe that they are the inherent attributes of species, genera, families and orders as well—that, in other words, nothing of life is eternal, unending, no matter what the surrounding conditions may be. Perhaps we may not prove that such a law has been an ultimate cause of the extinction of the animals of earth, but it is a very convenient theory at least in explaining many things which otherwise seem inexplicable.

Horses, forms doubtless allied to those

now living, existed upon the American continent nearly if not quite to the time of man's advent here, but they disappeared from causes which we do not understand. When introduced a few centuries ago the domestic horse at once adapted itself to those environments which seem to have been fatal to its early relatives; it quickly became feral, thrived and multiplied. And quite parallel to this history is that of the camels. Originating in North America, they lived and multiplied in their descendants perhaps nearly to the time of man, and then became extinct. But a herd of domestic camels from Egypt, turned loose near the middle of the past century, found so congenial a habitat in Arizona that its progeny, notwithstanding man's intervention, may still be roving over those arid plains. The immediate cause of the extinction of those old horses and camels was doubtless unfavorable environmental conditions, but the ultimate cause may have been a loss of racial vitality, or reproductive energy, the physiologic decadence of their respective types.

In a few words, then, these are the lessons that paleontology seems to teach. Every genus, every species, in the past has had a time limit, long or short in proportion as the genus or species was lowly or highly specialized. The extinction of all life has been followed by the evolution of forms of higher rank proceeding from the less specialized, the more potential, the less fixed. Are there any inferences to be derived from these apparent facts which may be applied as to the possible future of man himself? Possibly, probably. But here we enter upon a field which is largely speculation, and have to consider factors which may largely or wholly vitiate conclusions drawn from our still fragmentary knowledge of past life. That we may apply any inferences at all we must eliminate from the discussion all except the material and consider man simply as one of the many millions of organisms which have been evolved in the past or are being evolved in the present.

As an animal man has inherited from his ancestors not a few vestigial organs, organs of no use or even of detriment to him, heritages, sometimes, as is the

pineal body, from ancestors so remote that their functional use is lost in deepest obscurity. Other functions or other organs, in our own race at least, appear to be decadent and soon may be only vestiges. He has also acquired certain specializations which are yet detrimentally imperfect, so imperfect that future improvement may be expected, and among these may be mentioned the incomplete adaptation of the structure of his abdominal walls to an upright posture. And not a few of his other functions yet remain, innocuously or advantageously, imperfect, or have become so from lessened use. We will leave out of account all vexed theories as to the methods of evolution.

He cannot see as well, hear as well, smell as well as can many another animal far lower in the scale of development. He cannot swim as well or run as well as can many other mammals. In each and every one of these there may remain possibilities of higher specialization. In two things at least he stands supreme among animals, the use of his hands and the use of his brain, in both almost immeasurably above other animals. And here arises a perturbing factor, since we have never had to deal with intellectuality as the dominant characteristic of a species in past history. Through it or by it he has largely mastered all environmental adversities, has conquered or is conquering other forms of life. But not all other forms. Even as it may have been the insignificant creatures which brought final grief to the mighty dinosaurs of the past, so, too, it is the microphytes and the microzoa which still set man at defiance. Man, then, makes his own environmental conditions to an immeasurably greater degree than has made any other animal of the past or present, and in so far as this affects his specific well being his future will be greater. Nor is he over-specialized as a species, but is still capable of many, even physical, advances, tho a change of type is an impossibility. That he can never regain organs or functions once lost is probable, if not certain, tho he may acquire other organs and functions which will in part subserve them. His lines of evolution, then, are fixed within certain narrow limits, but within

those limits there are, speculatively, vast possibilities yet. The species as a whole is not decadent, or at least we have no evidence that such is the case. Everything goes to show that his physical and reproductive energies are, upon the whole, as great as they ever were, tho there may be partial race suicide; and certainly his mental powers have not waned in historic times.

From the standpoint of race—that is, variety—the same struggle for supremacy exists and always will so long as he exists. The stronger and more vitalized will succeed, the weak will fail—not necessarily the most intellectual, for man must advance in both physical and mental powers *pari passu*; otherwise, like the saber-toothed cats, one-sided development may become weakness by lessening his potentialities. And those races which fail will not necessarily be those which we now deem inferior. The Mongolians, in our arrogance, not long ago we looked upon as inferior to us, but we are rapidly changing our opinions in these days. Even as the mammals themselves remained so long in a humble station to at last overthrow the then lords of creation, so, too, it is not impossible that some race in the obscurity of to-day or to-morrow will be the stock from which other and dominant races, yea, even other species and other genera than *Homo sapiens*, may eventually arise. Will man ever become extinct? If we are to apply the conclusions derived from the history of the past he will eventually. If so, when? The answer to this question is so purely speculative that no one of rational mind would presume to answer definitely. The paleontologist, unless forced, never ventures to estimate in years the duration of any form of life in the past. How idle, then, to conjecture for the future!

If he ever becomes extinct will he be succeeded by some other highly organized animal springing from a generalized

stem. Such has been the history of the past. If so, from what animals? Here the limits of sane speculation have been nearly reached. May we assume that his line of descent is a dominant one and indefinitely perpetual? That from it will arise in the future new species, new genera, new families? Possibly. I see no fatal objections to such an assumption; indeed, no great improbabilities. In late geological history at least the law of brain development as emphasized, if not suggested, by Professor Marsh seems to hold good—that is, there has been a general advancement, in a physiologic sense at least, in the size of the brain as a characteristic specialization of the higher, perhaps all, forms of life. This brain evolution seems to have reached its ultimate possibilities in the genus *Homo*, but one would be rash to say that an even greater potentiality is quite impossible for other lines of descent, for other mammals, for birds or even reptiles, tho it becomes progressively more improbable, to the vanishing point, as we descend the scale below the primates.

These, then, are the conclusions of a paleontologist: No present species or genus of life will endure forever; that man the species, man the genus, man the family will eventually become extinct, to be succeeded by some higher organisms, his descendants or the descendants of some other creature now living.

So far as these speculations deal with the past they may have value; so far as they deal with the future they are hardly worth while, not at all worth while, were it not that such speculations as to the future destinies of our kind are closely interwoven with present and earnest beliefs.

And, furthermore, even these speculations, tenuous as they are, may be vitiated by the existence of a Higher Power. Is there such? I know not. I have only faith and hope.

CHICAGO, ILL.

# The Future of Dancing

BY HENRY T. FINCK

AUTHOR OF "ROMANTIC LOVE AND PERSONAL BEAUTY," ETC.

SHORTLY before leaving for Europe Mr. Carnegie made a speech at Northampton, Mass., in which he expressed his unqualified approval of dancing, on the grounds that we should make this life as happy as we can, and that it does much for children in improving their manners and bearing. At about the same time there was a convention of physical culture experts at the Teachers' College, Columbia University, at which Dr. Sargent, of Harvard, spoke on "Useful Dancing from the Physical Training Standpoint," and Elizabeth Burchenal explained how grace of carriage and posture are acquired by training in dancing.

In his recent erudite volumes on "Adolescence" President G. Stanley Hall, of Clark University, makes a strong plea for the dance:

" . . . We have in the dance of the modern ballroom only a degenerate relict, with at best but a very insignificant culture value, and too often stained with bad associations. This is most unfortunate for youth, and for their sake a work of rescue and revival is greatly needed, for it is perhaps, not excepting even music, the completest language of the emotions and can be made one of the best schools of sentiment and even will, inoculating good states of mind and exorcising bad ones as few other agencies have power to do."

Evidently a tendency in favor of a renaissance of the art of dancing is in the air. What are its chances of success? Has dancing a future?

It cannot be denied that at social functions it does not play as important a rôle as it used to. Girls still seem to be eager to dance, but dancing men (striplings excepted) are becoming more and more scarce. Yet it does not follow from this that the situation is hopeless. In all probability the tide might be turned if dances were held before midnight instead of after midnight. Most American men are hard workers, who cannot afford to burn the candle at both ends. The words "Dancing from nine to twelve"

on cards of invitation would doubtless bring many desirable men back to the ballrooms, and this is a consummation devoutly to be wished, for diverse reasons.

Undoubtedly women and men, girls and boys, in American cities do not get enough exercise. Time is short and transportation facilities are so abundant and cheap that very few do as much walking as consideration for their health demands. Nearly every afternoon I walk in Central Park, and every time I wonder at the lamentably small number of persons who frequent this beautiful patch of country in the midst of Manhattan for exercise and refreshment. Early dances, rendered attractive by beautiful women, bright lights, good music, simple suppers, opportunities for conversation and parlor games for variety, would doubtless attract many men who, in addition to all these things, would, like their partners, enjoy the hygienic advantages of one of the most efficient forms of muscular exercise.

Another consideration in favor of a revival of the social dance is that it affords the best opportunities for courtship. Doubtless the increase in the number of bachelors and old maids is partly a result of the decline of interest in dancing, during which new acquaintances are most easily made. The fact that at certain dancing schools and balls undesirable acquaintances may be made has caused many worthy parents to taboo dancing entirely, which is unnecessary, for if these parents will give the matter the supervision it calls for mistakes are no more likely to occur in the ballroom than at other social gatherings.

If dancing is to have a future it must be made suitable for others besides the very young, to whom it now appeals almost exclusively. Before the nineteenth century most dances were slow and stately. The young folks not being allowed to meet in the days of strict chaperonage, the art of dancing was in-

trusted to the matured and married folk, to whose needs the stately gavottes, minuets, sarabandes, etc., were well adapted. For those under thirty the rapid modern waltz, polka and gallop are no doubt best suited; but why not restore the dances of the time of Bach, so that the middle-aged might have something appropriate as well as the young? In the world of music there has been for some time a tendency to revive the medieval dance forms, which exist in great variety of rhythm and tempo, and perhaps these will sooner or later invade the ballroom too.

This would break what is one of the chief drawbacks of the modern saltatorial art—its monotony—and make the dance of the future entertainingly varied. Some of our schools are already teaching national dances (at the Teachers' College Convention referred to above illustrations were given of a "weaving dance" performed in Sweden at harvest-time and of a quadrille from the Island of Gothland). Here is a fascinating field of possibilities for the ballroom of the future! Every country has its national dances; the variety is simply endless. Think of the dances of Bohemia, of Poland, of Hungary, of France, of Spain, of Russia, of Japan and a hundred other countries! Think of the admirable use made of national dances by Bach, Schubert, Chopin, Liszt, Grieg, Dvorák, Tchaikovsky and many others, and imagine the dances which originally went with such music, or inspired it, transplanted to our balls! What a transformation there would be! What a gain on the artistic side! The future of dancing could thus be made as interesting as the present of music—and this music would of course be adopted with the diverse national dances.

It is only in this way that dancing can be saved. For some time it has seemed as if it would soon be a lost art; it has languished in the home as in the public halls (even the annual charity and masked balls have ceased to attract), and we seemed in a fair way of following the example of the indolent Orientals, who have all their dancing done by proxy. "In the eyes of the Chinese," says Letourneau, "dancing is a ridicu-

lous amusement by which a man compromises his dignity."

International dancing, with its fascinating rhythms and varied local color, would raise the amateur art to the level of private theatricals and of domestic music. It would thus receive a tremendous stimulus, and both the young and the more elderly could be accommodated, for the national dances vary all the way from the melancholy Hungarian lassu to the wild friska, from the graceful Polish mazurka to the lively Spanish bolero or fandango with castanets.

The future of professional dancing also lies partly in this direction. The old-fashioned tiptoe dancing on the operatic stage has almost entirely disappeared, thank goodness! It was the most ungraceful thing imaginable; the dancers, in their scant and grotesque attire, whirling about on the tips of their stiffened toes, had a movement as awkward as if they were going about on stilts. We are less easily amused than our ancestors; the spectacular, pantomimic ballet alone can sustain our interest in stage dancing.

In this branch of the art there are possibilities which our managers have not yet seized. They have withheld from us in particular the delightful ballets set to music by some of the greatest modern composers. Rubinstein wrote one, "The Vine," and he introduced charming ballet music into "Feramors" and his other operas, but we hear it only in our concert halls. Modest Tchaikovsky relates how his brother, Russia's greatest composer, and Saint-Saëns, the chief of French composers, were enamored of this form of their art. During a visit which Saint-Saëns paid to Moscow he discovered that his tastes tallied in many respects with those of his Russian colleague:

"Both, for example, were in their youth very enthusiastic over the ballet and often tried to imitate the dancers' art. That suggested the idea to them of dancing for each other, and so they performed on the conservatory stage a short ballet, 'Galathea and Pygmaleon.' The forty-year-old Saint-Saëns took the part of Galathea and played the rôle of the statue with great devotion, while the thirty-five-year-old Tchaikovsky impersonated Pygmaleon. Rubinstein, at the piano, served as the orchestra."

Tchaikovsky preserved his interest in the ballet to the end of his life. Practically his last work was the "Nut Cracker," a most entertaining composition, the music of which has become very popular in concert halls, especially in England. I have been trying hard to persuade Mr. Conried to produce this ballet at the Metropolitan Opera House. It would surely be a success and would show us the great Russian symphonist from a new point of view.

As long as great men of genius are thus interested in the terpsichorean art we need not despair of its future. The new Hippodrome gives astounding proof

of what can be done in this line with the aid of plenty of cash. Its ballet surpasses in splendor anything ever done even at the Metropolitan.

With Mr. Stanley Hall's intimation that the dance "is perhaps, not even excepting music, the completest language of the emotions," I cannot agree. It was so among savages, who not only exhibited all their feelings in dances, but believed that the buffalo dance, for instance, would act at a distance and bring the herds within their range. Such an exalted place the dance will never hold again, but that it has a future is, I think, indubitable.

NEW YORK CITY.

## Profit-Sharing with the Customer

BY N. O. NELSON

[Our readers know how well Mr. Nelson has succeeded in making Leclaire village a model one, and how he has established in the desert of New Mexico a free home for consumptives, but the latest experiment in moral economics, which he describes in this article, is entirely new. It is hardly necessary to add that the scheme will make even our professional reformers rub their eyes.—EDITOR.]

I HAVE heretofore told THE INDEPENDENT readers of the profit-sharing plan which the N. O. Nelson Mfg. Company of St. Louis, Mo., adopted in 1886 and has continued ever since. I am now to tell about taking the customers and the public also into partnership.

For nineteen years the employees have received dividends of from 4 to 10 per cent. on their wages and salaries. All but the latest comers are stockholders in the company, their dividends having most of the time been paid in stock. All sick and disabled and widows have received suitable maintenance.

I have also told you of the town of Leclaire, in Illinois, 18 miles from St. Louis, planted in a wheat field in 1890, with its work, its education, its recreation, its beauty, its homes and its freedom. Leclaire was born and built on no other theory than that of improving the going methods of the world's work and life. Neither I nor my neighbors

and associates who live there regard ourselves as a community of saints. We are simply an industrious, well behaved, jolly lot of ordinary people. We have no rules, nor police, nor boss—in the fifteen years we have had no need of any. Visitors admire Leclaire, praise what we take as a matter of course.

I have told you about the Industrial School—not reformatory, please—where boys of sixteen and over study half the day and work as apprentices the other half. The schooling is free, the work is paid for and the students pay the cost of co-operative board. We do not aim to manufacture professional intellectuals for positions on top of the coach, but intelligent and competent men for the world's common duties. About half of the students are children of our own Leclaire people; the other half are from various States and countries.

A few months ago we celebrated with a banquet the thirty-third anniversary of the business and there announced a new

departure for the future. It is about this that the editor has asked me to write.

Beginning with the present year I, as the principal owner of the company, have quit taking any profit or interest. I get a living wage for my work; that is all, and it is enough. The profits are divided between the employees, the customers, philanthropy and the stock held by others than myself. Summing up the division without reciting the technical details, the employees get about one-third of the profits, the customers one-third and the employee stockholders and philanthropy the other third. The employees get dividends in proportion to their wages, the customers in proportion to the profitableness of their purchases. The stockholders other than myself get interest and a sliding scale of bonus. Philanthropy gets about one-fourth of the whole. I use the word "philanthropy" because it is an honest word and a good one. It means "the love of men" and in this case it is applied to such necessary and helpful things as we think most useful to the unfortunate. To this fund will be added such a portion of my capital as can be conveniently withdrawn from the business.

The dividends will be paid in my stock, thus giving me the money, and the employees and customers the ownership of the business. It will take no great length of time to make them the complete owners and the company a completely co-operative concern. This has been my objective point for many years past, awaiting only the proper conditions.

The logic of taking the employees and the customers into partnership is that these two classes together make the profit. The former do the work, the latter take the product and convey it to the public.

A share in the profits is a very different thing for employees from getting an advance in wages. If, in good times, the wages were advanced so as to pay out their share in the earnings the scale of living would, in most cases, be increased, and when times were poor and ordinary wages only could be paid a hardship would be felt. In paying the usual rate of wages and paying the dividends in stock they become the joint possessors of the means by which they make a

living, they have a proper interest in their work, they are accumulating a reserve fund for the exigencies of the future, and in due time their stock or their future cash dividends can be diverted to the making of homes, which very few employees now enjoy. It is not well for any one to be rich, neither is it well to be empty handed. A man should own the means by which he works, either severally or jointly, and he should own a home to live in. His manner of employment is the foundation of his home life and family; it is an essential in the social structure and political stability. The predominant proletariat is more than a menace; it is inevitable destruction.

The customer is taken into partnership because he contributes to the profit, because he is an interested party, because his good will is essential to the business. He is an active and necessary participant in the operations that yield the profit.

Profit arises partly from underpaying the employees, partly from overcharging the buyer and overpaying captain or capitalist. This contingent fund is needed for additional working capital, for homes and for social utilities, including education and aid for the unfortunate. It is better to use it this way than divert it into the congested channels of extravagant and injurious living for a few or for superfluous capitalistic investment in speculation. Should profits be largely expended on home building, the unfit tenements will be vacated and replaced. None will be built. When used to fully care for the dependents there will be little use for the poorhouse and outdoor relief. If also freely used for special education, the great endowments would lose their terror for college presidents and millionaires.

While I have thus resigned as capitalist I retain my post of captain and I shall most likely continue in that position as long as I am wanted. The business can safely be trusted to other hands. A well organized business, like a well organized army, has lieutenants fit for promotion and command. No organization is in safe condition that is dependent on a single head, neither is any large corporation dependent on the owners of the capital for good management. The majority of large corporations are conducted by

hired general managers and a corps of captains who may or may not own any of the capital. The functions of a captain of industry are disconnected from a controlling ownership. His business is to plan, to organize, to direct. He may be more or less a master of detail, but first and foremost he must correlate the men and the parts, he must adjust and harmonize, he must make ends meet. No command in the world can so decisively test fitness nor so surely eject the unfit.

As the captain of industry need not be a capitalist, need not gain wealth, neither need he be a mere plodder nor a speculator nor an autocrat. He needs imagination to see plans in his mind, he does well to cultivate his mind and feelings by classical reading and by intellectual association. He needs robust health, which he may get by walks afield, by labor on the land or, if penned in by miles of brick wall, the gymnasium will answer. Plain living is good for him as for everybody. He should have a heart with red blood flowing out of it in a cataract stream.

The ability and force implied by his position should serve his subordinates and the public. He belittles himself and his opportunities if he confines himself to mere trade and mere getting. He should be neither an ascetic nor a sybarite, neither a spendthrift nor a miser, not tied to tradition nor the credulous victim of fads.

Rather than accumulate large possessions for himself, it is better sense and better ethics that he manage for the interest of those immediately under his direction and for a widened circle beyond this. Incidentally he is always a servant of the public; he had better be so designedly.

Business has its cares and its perils. There is an irrepressible conflict between the employer and the hired one, between the merchant and the buyer. The whole process of buying and selling, whether labor or merchandise, rests in the larger sense on the old maxim of buying in the cheapest and selling in the dearest market. In the nature of the case and by tradition and education each tries for the best bargain. The conflict of interest is not only irrepressible; it is constant, not always seen, but always felt.

"The higgling of the market" is the formula of the orthodox political economy for arriving at prices and wages. Close upon the heels of this higgling and haggling come the "tricks of the trade." Fixing uniform prices by combinations and wages by unions are inevitable expedients to avoid destructive competition. No one has yet presented an acceptable theory of equitable division when trade is conducted for private profit. We must get along with the empirical methods we have. But we may approximate economic values and abate the glaring business evils by accepting wages and prices as they are and thereafter equalizing by dividing the profits between the two sides. When the seller is not perceptibly benefited by high prices there is a distinct advance toward amicable relations, toward a conscious mutuality.

When an employee of any grade, from manager to apprentice, receives the other half of the profit, he must be both stupid and base if he does not avoid waste of time and material. He can see ahead an adequate independence. Misfortune does not appal him. He can marry when he falls in love, because the key to a snug little home hangs on his peg.

No system can assure beyond mischance any business or any human venture, but there is infinite strengthening of all the strands that hold an industrial organization together when the interests of employees and customers are united.

The portion taken out for philanthropy is as logical as the provision for homes and social and sanitary conditions. A healthy and vigorous corporation composed of able and generous men can well afford to care for its own disabled and at the same time do something toward improving the conditions and relieving the distress of its neighbors. All men have a generous streak if only you touch the right nerve. When philanthropy becomes regularly established as a part of the system of this co-operative corporation I have faith that the employees and customers will take an honorable pride in maintaining it; they will be glad to contribute to meritorious public uses a portion of the common fund whose beneficent wings promise shelter to them and their loved ones and their neigh-

bors in the day of disaster, against which no one is assured.

We struggle intensely for foreign markets. Our navy is built mainly to keep open the door through which our surplus goods may pass. Better that we use this surplus at home and save ourselves the cost and the blood of war. We produce nothing more than we need at home, provided only we put it in the proper channels. All the labor employed in making goods for foreign markets could well be used for building fit homes for those of our own people who now occupy inadequate and unsanitary tenements. Better houses, better living, more schooling, better goods and clothing are needed. Our production is misdirected. We make things we do not want, and do without the prime requisites of civilized living. By distributing the profits, the "surplus value," among all the people we give them purchasing power and make a home market for all the commodities we can make. Let us stop making too much steel and build more and better houses for the common people. If we make too much cotton cloth, let us rather make more schools. More fruit and vegetables and meat might well take the place of the corn and wheat we ex-

port. If only the circle of demand was set in motion by increasing the income of consumers through a distribution of producers' profits we should make a healthy demand for all the labor we have.

A prominent manufacturer said recently that he devoted himself first to God, second to his family, third to his business. This order is good, somewhat equivalent to Theodore Parker's "I love my family better than myself, my country better than my family, the world better than my country." In either case the essential matter is whether the love to God or love to the world is a metaphysical concept or a reality, whether the love is shown in praying or practicing. God needs no incense or praise, but His children need much.

"Yea, what avail the endless tale  
Of gain by cunning and plus by sale.  
Look up the land, look down the land,  
The poor, the poor, the poor, they stand  
Wedge'd by the pressing of Trade's hand  
Against an inward opening door  
That pressure tightens evermore.  
They sigh a monstrous foul-air sigh  
For the outside leagues of liberty,  
Where art, sweet lark, translates the sky  
Into a heavenly melody."

ST. LOUIS, MO.

## The Japanese Canon of Taste

BY ADACHI KINNOSUKE

TO you who understand Greece—the Laconia of Lykurgus and of Leonidas, the Attic civilization under Solon and Pericles—Nippon and her culture, her ideals, her strength and weakness should be as an open book. Simply clothe the ancient Hellas in kimono and give her an Oriental setting—that is all that you have to do. Only in the variations which the accidents of environments have brought forth do we differ from the Greeks. In our national ideal we emphasize the State at the expense of the individuals, as did the Greeks. As you know, in the West of the civil-

ized to-day you make the individual the center of the universe; from the individual as the starting point you make all calculations. In Nippon we apotheosize the whole, the State; individuals do not count in comparison. Because His Majesty, the Emperor of Nippon, gives flesh and blood to this ideal of the whole, the State, his power over the nation is superhuman; as a political force, there is none among all the crown-shadowed heads like unto him. His power is as overwhelming upon the action of our national life as that of the ideal upon an individual. The story of the rigorous

training of the samurai and his worship for the sword and aspirations for fame reads as an Oriental version of the Spartan history. Athens flowered upon the isles of the Pacific in the culture of Nara, of Kyoto and of the Yedo of the Genroku period. In the matter of religion—the expression of the deepest phase of human life—both on the Mediterranean and upon the Pacific, the forces of nature were apotheosized; the Greek called it mythology; we call it Shintoism.

These analogies are striking. More striking even than these, however, is the similarity in the troublous matter of taste. Simplicity and the appreciation of the proportion of things, men and events, are the distinguishing hall mark of Hellenic culture. Higher than that has the esthetic ideal of Nippon never climbed.

Let us take it up on elementary lines, this question of the canon of taste—food. Plain living and high thinking, said your Concord sage, following Wordsworth. And the reason why we, in Nippon, have no such historic phrase as that is chiefly because there seems to be little occasion to call it forth. You have heard much of the simple diet of the Nippon people and how, in the present trouble in Manchuria, the excellent showing of our soldiers' health is largely due to that fact. It is not a national habit of the people of Nippon born of a modern day; neither is it confined to the men of modest means. Years ago, in the golden days of samurai and castles, simplicity in diet reigned over the banquet halls of the princes with a much more despotic scepter than it does in the civilized today. With the rich, above the necessities of life the simple rigor of his table was a question of art-conscience, a matter of taste; it was the stamp of refinement. It was not economy alone that was aimed at in those elegant feasts; apparently simple, the banquets of those rigorous days cost much more than those which might have been styled sumptuous. It is true, also, at a number of historic functions a number of rich dishes were offered; but the rich courses and costly *saké*, if used at all, were nothing but a means to an end. They were the setting by which the excellences of the elegance of the simple might be brought out with the advantage of contrast.

In the castle town of my forefathers there lived a man of taste. He was of the princely line of Matsudaira, lords of the historic castle of Mitsuhide. In honor of the autumn moon he asked on a day of happy omen a few men and women to join him in the Hall of Kiri (*Paulownia imperialis*). They were men and women first of all, and then too they were men and women of culture, of letters, of taste; and, singularly enough, all indifferent to wealth. Classical couplets flowed with the choice *saké* in the silver light of the cloudless night; our Lord Matsudaira was a master of imagination and of literary grace. On this occasion every dish that was served to his friends was a work of art; some of them even more beautiful to the eye than tempting to the palate. As the ripened full moon hung on a far gone hour of night and upon the arm of the pine sleeved with the frosted dusk, and the feast was also ripening to its close, and his guests were marveling at the richness of the feast and the *saké*, our lord of the clan lifted up a cup in his hand and faced his guests. Silence fell upon the Hall of Kiri. The cup in the lifted hand of the Prince was filled with pure water.

"Permit me to offer you, by way of crowning the humble refreshment, a cup which is not unworthy for the lips of the gods. For I have reserved to the last this, the choicest offering; I hope you will forgive me for imposing common *saké* upon your good nature. I know after so much common *saké*, the virtues of this cup which I am about to beg you to partake, will be the more keenly appreciated by you."

And in the matter of dress also: It was in the city of Kyoto (and the culture, especially in taste, of the ancient capital of the Mikado is as old as the mosses upon its temple yards) there lived a man whose name was Isono; he was famous as a man of taste. When my childhood days were graced by the acquaintance of him—he was fond of children—he was a man of over sixty-five. A man of wealth and of rank, he had devoted himself without reserve to the appreciation and creation of the beautiful in flowers and in letters. In letters he was partial to that choice form of belles-lettres called *hokku* or *haikai*,

which demands of an artist in letters to give to the world in seventeen syllables—syllables, not words, pray mark—a poetic thought, a fairy world, a finished and polished expression of wisdom; or a glimpse of a deep philosophy, or sometimes even a peep into the world unknown or a spark such as would kindle the heart of a nation, a torch whose light is the fire of patriotism. To the cultivation and perfection of a certain type of chrysanthemums also he had given over twenty years of his life. All his life he had never allowed silk to adorn the outside of his garment. One day a Bohemian friend of his, who was famous for his abnormal weakness for levity, spied a twinkle of silk peeping out from under his cotton kimono.

"Ah, silken garments, Mr. Isono," said the Bohemian, delighted.

"The old age is a mischief of a thing," the old gentleman apologized, "my shoulders find comfort in the light weight of silk. When you think of it a little you can hardly blame them, they have borne the snow-weight of over sixty winters, and that is a good deal for a pair of common mortal shoulders. I am using silk for the lining of my kimono."

Now Kyoto is famous as the home of a gold brocade called the Nishijin weave, which has belted the world with the praise of the Japanese textile industry. One day a friend of the old gentleman took him to task:

"You are a native and citizen of the city of Kyoto; you are very hard upon Nishijin-ori, which is one of the glories of her industry."

"I am not such a solemn foe of the Nishijin brocade as you seem to take me. It is a good thing to amuse children. The good people who have never seen anything better, I notice, are always delighted with it. I am always happy when others are pleased. Only . . . I notice that the rise of the Nishijin industry marked the fall of the Tokugawa power; it might be a mere historical coincidence."

To the eyes of America and Europe the interior of our houses is bare. It is not because we have no decorative art, because if the art world of Europe could be taken as an authority on this point we in Nippon have the finest development of

that very phase of art. And it is far from being bare, if you but look about a little. In every room in a Nippon house into which the outer world is likely to be admitted you can always find an alcove called *tokonoma*. Upon a low platform of the *tokonoma* it is usual to find a vase, in it a flower arrangement. You may also see a *kakemono*, which is of paper or silk and in shape a long, narrow panel, and which is suspended by cords upon the wall. Upon the *kakemono* you might find a study in black and white by Buncho, Sesson, Korin, or a water color by Okio or Goshun. Instead of pictures, and quite often, too, one finds a few lines of chirography; a classic couplet, perhaps, or a Chinese poem or a text from an ancient sage—but all traced with that vigor and with that eloquence that tell of the character of the penman and appeal to the imagination of the beholder and which make brush-writing one of the branches of fine art in the Far East. This bareness of our rooms is not without reason. In the first place, our rooms, as we look at them, are not exactly a second-hand curio shop. In the second place, our faith in the ability of quantity and number making good what quality lacks is rather weak. Moreover, and this is the third reason, we are abject slaves and our task master is called the beautiful; her thralldom, let me assure the innocent, is not a whit lightened because the chains with which she binds her slaves are of art. Our reverence for a work of art is a superstition—foolish, mad, past all the understanding of the wise West. Like love—and most assuredly our passion for the beautiful is infinitely more serious than the appetites of the flesh—it is a jealous divinity that we serve. It gives us much and all sorts of trouble. And one of them is this: If a work of art is worth our respect at all it commands our undivided worship at least for a time. It is not permitted us, therefore, to serve two gods at one and the same time. That, then, is the reason why we have always one *kakemono* upon the wall of the *tokonoma*. And the fourth reason, which some consider even more important than the third, is much simpler than the others; and for that very reason, no doubt, it seems to

be overlooked by the critics from abroad. With us the decorations of a room are not meant to show our friends and the public how much we have. They are, first and last, to please the people—first, those who would be guests, and then those who home therein. Only the geisha are forgiven for the vanity of their hair pins, called *kansashi*, for their brocade belts and the color scheme of their dresses, which contrast shockingly with

the neutral tints of those of their sisters of culture, and which are constantly screaming to the highway upon which they pass that there is something for every eye to see—forgiven even in them and not at all approved. And a geisha of distinction always shuns the cheap display of her sisters as if it were the poison which is able to destroy both soul and body.

NEW YORK CITY.

## At a Soldier's Grave

BY LYMAN WHITNEY ALLEN

THIS is a soldier's grave,—  
The grave of a youth who fell  
At Gettysburg fighting to save,  
'Mid tempest of shot and shell,  
The Stars and Stripes and the Union's life;  
And thus he fell in the strife.

A bullet crashed through his brain  
As he raised his musket to fire;  
From heaps of ensanguined slain  
They bore him home to his sire  
And her who was shedding the unseen blood  
Of heart-broken motherhood.

He lay in his casket dead,  
Enshrined in the Flag's embrace;  
White banks of flowers at his head,  
Hot kisses and tears on his face;  
They buried him here on this gloried spot,—  
This soldier youth who was shot.

I stand by this sacred sod  
And wonder, with thoughts benign,  
If ever he gave a sign  
Of trust in the living God;  
Of faith in the Christ divine.

I find me a baffling task;  
The unsought question will not away;  
But I stand at this soldier's grave and ask,  
With eyes on God's blue without dismay,  
Was it nought to God that he fought and fell  
Set face unto face with shot and shell,  
And all for his country's highest good,  
The making of human brotherhood,  
And all for the purpose of Providence  
Thus safely kept for the ages hence,  
For the working of God on eyes long blind,  
For the touch of the sky on the earthly mind,  
That Godhood and manhood might be allied,  
That the best in the race might be magnified,  
For the golden centuries yet to be  
Dependent on human liberty?

Since Jesus of Nazareth died for men,  
Methinks His grace is not least inclined  
Toward them who fashion His deed again  
In dying to save mankind,  
Who go like Him into blood and dust  
Borne down with the sense of a sacred trust,  
And sow themselves that the nobler worth  
Of manhood may blossom throughout the earth.

This man sowed self in his human way,  
Being only man, not God like Christ;  
He did his duty, he fought in the fray,  
And his life he sacrificed.  
And standing here by this soldier's grave  
I feel, I cry, some time, somewhere,  
A soul like his must have felt a wave  
From the inner deeps of God's love and care  
O'er the inner deeps of his mind and heart,  
And answered "Yes" to the Father's  
"Come";

For God is God and His earthward part  
Is not to be blind or deaf or dumb;  
For God is God, and His sovereign mood  
Is the measureless love of His Fatherhood.

Methinks that the One whose heart is shown  
In Christ's understanding and tenderness  
Must have some way, unto us unknown  
Who kneel and His name confess,  
By which through the power of the Holy Ghost,  
A working of love past human ken,  
He reaches and saves to the uttermost  
The men who have died for men.

On thee, O grave of the patriot brave!  
I strew these roses of hope and trust;  
Sufficient is He who seeks to save,  
Our God who remembers that we are dust.  
And here in God's-Acre of tragedy,  
By light of the Love that makes all things new,  
I dare to forecast what is to be,  
That Christ and the world shall one day view  
Together the travail in which He died,  
And God and the world shall be satisfied.

## Exploring the Forbidden Land

THE reports of the British Mission to Lhasa have a unique interest in that they represent the completion of the exploration of the habitable globe. Never again will two volumes be published containing so much hitherto inaccessible information about any people as these of Mr. Landon and Lieutenant-Colonel Waddell,\* for there is no other country of like degree

\* *THE OPENING OF TIBET.* By Perceval Landon, Special Correspondent of the "Times." With an introduction by Colonel Younghusband. 500 pages. 49 illustrations, 1 colored. New York: Doubleday, Page & Co. \$3.80.

*LHASA AND ITS MYSTERIES.* By L. Austine Waddell. 530 pages. 146 illustrations, 3 colored; 8 maps and plans. New York: E. P. Dutton & Co. \$6.

of civilization from which modern travelers have been so persistently excluded. But now, owing to Lord Curzon's expansive nature, we have snapshots and pen-pictures of all the mysteries of the sacred city of the incarnated Buddha. Here, on the roof of the world, the theosophists told us, the Mahatmas had taken refuge to get above the materialistic miasma in which we are living. Now that their haunts have been so ruthlessly invaded they will have to remain permanently in the fourth dimension of space, whither they have hitherto only occasionally resorted.

Narratives of exploration of the polar regions can tell of nothing but monoto-

Lhasa, Dominated by the Towering Bulk of the Potala. From Landon's "The Opening of Tibet." Doubleday, Page & Co.

nous fields of ice; travelers in the tropics meet only savage races; but in Tibet we have an ancient and peculiar civilization, where the priests of one of the great religions of the world have had undisputed and uninterrupted control of the political and social life of the people for many centuries. Here was a pope with no emperor to divide with him the governance of the world; here was a people whose devotion shrank from no form of penance and self-sacrifice; here was a religion purer in its origin than any other save one—and the result is Lamaism. Here is where praying is done by the twirling of wheels, where ritualism takes the place of ethics, where polyandry is a common form of matrimony, where cleanliness is as unknown as godliness, where men seek salvation by burying themselves in the ground for life, thinking of devils and drinking from human skulls.

Unfortunately the living god to whose toenails 4,000,000 people address their prayers was not at home when Colonel Younghusband called, but of his palace, the Potala, and of its Holy of Holies we have detailed descriptions and photographs. Mr. Landon thus describes it:

"It drags the eye of the mind like a load-stone, for indeed sheer bulk and magnificent audacity could do no more in architecture than they have done in this huge palace-temple of the Grand Lama. Simplicity has wrought a marvel in stone, nine hundred feet in length, and towering seventy feet higher than the golden cross of St. Paul's Cathedral. The vivid white stretches of the buttressing curtains of stone, each a wilderness of close-ranked windows and the home of the hundreds of crimson-clad dwarfs, who sun themselves at the distant stairheads, strike a clean and harmonious note in the sea of green, which washes up to their base. Once a year the walls of the Potala are washed with white, and no one can gainsay the effect; but there is yet the full chord of color to be sounded. The central building of the palace, the Phodang Marpo, the private home of the incarnate divinity himself, stands out four-square upon and between the wide supporting bulks of masonry a rich red-crimson, and, most perfect touch of all, over it against the sky the glittering golden roofs—a note of glory added with the infinite taste and the sparing hand of the old illuminator—recompose the color scheme from end to end, a sequence of green in three shades, of white, of maroon, of gold, and of pale blue.

The brown yak-hair curtain, eighty feet in height and twenty-five across, hangs like a tress of hair down the very center of the central sanctuary hiding the central recess. Such is the Potala."

One, at least, of these books is indispensable to every library of any pretensions to completeness, for there is nothing to take their places. It will be somewhat difficult to decide between them, for they cover much the same ground. Both give a narrative of the journey from India to Lhasa and back and a description of the country and its people. Mr. Landon has the genius of the true reporter for weaving a large amount of detail in an interesting "story," but he gives no map or index, which, in a book touching on so many subjects and dealing with a region hitherto unexplored, is quite inexcusable. Dr. Waddell pays more attention to the religious customs, which his previous study of Buddhism qualifies him to interpret. For this reason and on account of its index and maps it is more useful as a reference book than the other. Both volumes are thoroughly illustrated by admirable reproductions of photographs taken on the expedition.

## A New Study of Evolution

It is interesting to note the slow change of view of scientific men in regard to certain fundamentals which were formerly held to be immutably established. And herein science itself is seen to be subject to the universal law of evolution. It is not so very long ago that the scientific world regarded uniform, definite and absolutely fixed species as the units of all biological classification. Then came a period in which these units were conceived to be uniform and definite, but slowly varying, a change of view which required some mental readjustment and some bending of the old systems of classification. In time the doctrine of the definiteness of species gave way to that in which the limits of species were but illy defined, one merging into another without sharp lines of demarcation. From the last the step is short and easy to the abandonment of the doctrine of the uniformity of species

and the recognition of "simple" and "complex" species. With the abandonment of uniformity and a similar abandonment of definiteness and fixity, what is there left of the earlier idea of species? It is not difficult to see that these radical changes in regard to the nature of species must severely strain and ultimately destroy the ancient framework of the system of botanical classification.

In a course of lectures delivered last year Professor Dr. De Vries\* takes up at considerable length the problems connected with these changing views. So much has been said about his attitude with reference to Darwin's theory of evolution that it may be well to quote a sentence from his preface:

"My work claims to be in full accord with the principles laid down by Darwin and to give a thorough and sharp analysis of some of the ideas of variability, inheritance, selection and mutation, which were necessarily vague at his time."

Again (page 7) he says: "Darwin recognized both lines of evolution" (*i.e.*, "the sudden and spontaneous production of new forms from the old stock" and "the gradual accumulation of those always present and ever fluctuating variations which are indicated by the common assertion that no two individuals of a given race are exactly alike"). Still later (page 18), in referring to Darwin's view of the relation of natural and artificial selection, he says: "I hope to show that he was quite right." Surely the anti-Darwinists who have been claiming De Vries as one of their number have been overhasty.

The points emphasized by De Vries are elementary species, retrograde varieties, ever-sporting varieties, mutations and fluctuations. As to "elementary species," these are what some of us have been in the habit of calling sub-species, and what we have called species in our systematic works are, as a rule, compound groups, composed of two or three or a few, or "even hundreds of constant

and well differentiated forms." The view is advanced that it is by the improvement of these elementary species that we obtain the original horticultural and agricultural races and varieties, while in Nature by natural selection elementary species become more sharply differentiated so as ultimately to be recognized as systematic species.

How do these elementary species arise is evidently a question of the greatest scientific importance. By mutation, answers De Vries, and mutation is shown to be the sudden varying of a plant in one or more of its characters and the starting at this point of a new type. Some of these mutations are very slight divergencies from the parent type from which they sprang, while others are so great that their resemblance to the parent type is almost lost. When once a new type appears it continues indefinitely without change until it disappears (sometimes very soon, sometimes only after a long period) through natural selection.

The new doctrine is new only in that it shows us how the varieties, small or great, arise, and in emphasizing the fixity of these varieties during their existence. Not only does De Vries show us *how* new species arise; he shows us that they are actually arising before our eyes. It has long been a favorite amusement of a certain class of irreconcilable disbelievers in the general doctrine of evolution to demand of the evolutionists an authentic instance of the appearance of a new species, well knowing that the supposed slowness of the process made it well nigh impossible for their challenge to be met. De Vries has shown how we may see the incoming of new species, not in few and isolated cases, but in great numbers. Instead of being a rare and uncommon event it is one of the commonest of all natural phenomena.

### South American History

UP to the beginning of the nineteenth century and the advent of Bolivar the history of South America is chiefly annals of Spanish misrule. After the expulsion of Spain there remained populations of mixed and degraded blood, not merely without traditions of self-

\* SPECIES AND VARIETIES, THEIR ORIGIN BY MUTATION. *Lectures Delivered at the University of California by Hugo De Vries, Professor of Botany in the University of Amsterdam.* Edited by Daniel Trembly MacDougal, Assistant Director of the New York Botanical Garden. Chicago: The Open Court Publishing Company; London: Kegan Paul, Trench, Trübner & Co., Ltd. 1905. Pp. xviii, 847, octavo. \$5.00.

government, but with no capacity for it. Of their subsequent career there is little to record but anarchy and massacre, riots scarce worthy of the name of revolution and endless struggles between communities equally savage, or, more commonly, civil strife between factions equally corrupt and equally intent on plundering one another.

The task of the chronicler of the internecine disputes of the little States of ancient Greece is difficult and monotonous enough, but at least there were the beginnings of many great political ideas and everything pertained to the most marvelous people the world has ever known. The same difficulty and monotony is encountered in dealing with the South American republics, but without relief from the unbridled barbarism of races at the opposite end of the intellectual scale, and without lessons to deduce save those which long since have proved their truth in the decadence of Spain.

To this inviting labor Mr. Charles Edmond Akers<sup>1</sup> has addressed himself and in a volume of nearly 700 pages has presented a plain, straightforward, businesslike account of the successions of disturbances which make up the history of our Southern neighbors. There was no occasion for rhetoric in dealing with events which constantly invite the language of hyperbole, and amid the infinitude of confused and correlated happenings philosophy has no place. An introduction and a conclusion serve to connect the otherwise separate accounts of the political progress, or rather lack of progress, of the several States, but in point of lack of civilization there is little choice between them. Whatever culture there is is restricted to a small minority of the European element. The most modern of their possessions are military weapons. Ecuador, Venezuela and Colombia are the most backward and barbarous, Brazil is at the lowest moral level, Chile has shown more capacity than the others for constitutional government and there are even signs of advancement in Argentina, mainly due to immigration from Italy and investment of foreign capital. Bolivia, Peru and Chile all have

possibilities of development depending on their mineral wealth, but political corruption is everywhere. The general outlook which Mr. Akers presents is anything but reassuring, and his belief that our recent doings in Panama have materially injured the otherwise salutary influence of the United States seems to deprive him of any hope, at least for the near future.

The book is informing rather than entertaining, but this is a good feature, for the desire for better knowledge concerning the territory under the Monroe Doctrine is steadily increasing in this country, and just such a temperate and clear account as Mr. Akers offers is much better calculated to meet this demand than impressions of the picturesque or stories of careers as phenomenal as those of Bolivar, Lopez or Balmaceda. The work deserves wide and thoughtful reading, for there is nothing extant on this subject either so comprehensive or so reliable. The maps provided are large and good, and there are plenty of portraits which are in themselves especially interesting.

Mr. Akers wisely limits himself to the period included between 1854 and 1904. Mr. Thomas C. Dawson<sup>2</sup> goes back to the Empire of the Incas and the times of Pizarro and Almagro, because his book belongs to the "Stories of the Nations" series. He is much more optimistic and even thinks that "the moment the first vessel floats through from the Caribbean to the Pacific the course of commerce will reverse its direction" and all other foreign influence will be subordinated to that of the United States, which in time—how long not stated—will finally culminate in a sort of general bond of mutual interest between the South American peoples and something like a political and commercial millenium. Be this as it may, Mr. Dawson's statement that "intelligible details about comparatively recent times are proverbially the hardest to obtain" and his citation of "South America diplomats" as his chief authority put Mr. Akers' work far in the lead in point of present and live information. Mr. Dawson's book is, however,

<sup>1</sup> A HISTORY OF SOUTH AMERICA, 1854-1904. By Charles Edmond Akers. New York: E. P. Dutton & Co. \$6.00.

<sup>2</sup> THE SOUTH AMERICAN REPUBLICS. By Thomas C. Dawson. In two parts. New York: G. P. Putnam's Sons. \$1.50 each.

fully worthy of a place in the series to which it belongs, and probably serves its purpose there even better than would its larger rival.

**Fountains Abbey: The Story of a Mediæval Monastery.** By George Hodges, D.D., Dean of the Episcopal Theological School, Cambridge, Mass. New York: E. P. Dutton & Co. \$3.00.

Dr. Hodges's study of Fountains Abbey is founded on the writings of English antiquaries, archeologists and ecclesiastical scholars who have given years of patient and loving work to the history of Craven's famous ruin. He has, however, been much on the ground. He is well-versed in the architecture and literature of the monastic period in England and France, and it is agreeably obvious on every page of his history that the life which the members of the Cistercian order lived during the four centuries in which Fountains Abbey was the principal seat of the order in England had become very real to him during his "golden summer" in the Craven country of Yorkshire. Not only himself does Dr. Hodges carry back to the thirteenth, fourteenth, fifteenth and sixteenth centuries, and to the daily routine and environment of Abbot, Prior and Monk; he carries also his reader back with him, just as pleasantly and as effectually as does Dr. Jessop in his "Coming of the Friars," a book of permanent value, with which Dr. Hodges's *Fountains Abbey* is fully entitled to rank. The beginning of the Cistercian order in England and its quick growth after it had been established in the Skell Valley was an interesting story to tell. Moreover, it needed telling in a popular form. The authorities on which Dr. Hodges's history is based are voluminous; and while every first-class American public reference library has the publications of the Surtees Society and the journals of the Yorkshire Archeological Society, the literature of these learned societies is seldom inviting in its aspect except to students who have been initiated into the art of research, and just such an account as Dr. Hodges has written of Fountains Abbey is a volume to be welcomed. Fountains Abbey is the view-point from

which Dr. Hodges writes. It is with the architecture of Fountains Abbey that he is concerned and with the life which was lived there from 1132, when a little company of Benedictines went out from St. Mary's at York to live under stricter rule and soon to attach themselves to the then newly created order of Cistercians, until 1539, when the King's Commissioners took possession, and the partial demolition of the stately abbey immediately began. But between 1137 and 1150 six other Cistercian abbeys—Newminster, Kirkstead, Louth, Woburn, Kirkstall and Beverley—were established as off-shoots of Fountains, and while Fountains Abbey is the center of Dr. Hodges's story, he goes a long way toward telling the history of the Cistercian order as a whole in England. With a slightly different arrangement of the pages Dr. Hodges's book would have been one that would have been treasured by collectors of the printer's art. The "measure," as the printer would say, is just a little too short for the large size of the type. Uneven spacing—here too much and there none at all—is the result; and for this reason *Fountains Abbey* just falls short of being a splendid example of Edinburgh typography and presswork at its highest excellence.

**War of the Classes.** By Jack London. New York: The Macmillan Co. \$1.50.

Mr. London in this volume collects a number of previously published essays and papers bearing more or less directly on the irrepressible conflict between labor and capital. The most important of these, "The Class Struggle," was published in THE INDEPENDENT November 5th, 1903. Among others are "The Scab," from the *Atlantic Monthly*; "The Tramp," which first appeared, we believe, in *Wilshire's Magazine*; the comparative review of Mr. Brooks's *The Social Unrest* and Mr. Ghent's *Our Benevolent Feudalism*, from the *International Socialist Review*, and the autobiographical "How I Became a Socialist," from *The Comrade*. Some of Mr. London's best and most lasting work is to be found in these pages. It is regrettable, however, that certain discrepancies in the text have not been more carefully

edited, and that acknowledgment of the date and medium of the previous publication of the papers has not been made.

✱  
**Emmanuel Burden, Merchant.** A Record of His Lineage, Speculations, Last Days and Death. By Hilaire Belloc. New York: Charles Scribner's Sons. \$1.50.

This is an exceedingly witty satire on modern imperialistic and the "frenzied finance" methods of England. It is so close an imitation of the ordinary stately and stupid type of British biography that a careless reader would skim over many pages before he realized that the real story was written between the lines. No piece of social and political satire was ever more elaborately worked out in each incident, reference and detail, even to the titles of the amusing pencil sketches. Mr. Belloc is a master of the art of using praise that blames and commendation that condemns.

✱  
**Social Progress.** 1905. A Year Book and Encyclopedia of Economics, Industrial, Social and Religious Statistics. Edited by Josiah Strong. New York: The Baker & Taylor Co. \$1.00.

This is the second issue of this year book. Considerable new matter has been added, and corrections bringing the matter up to date have been added. It is, on the whole, an excellent volume, which every student of social questions should have. We note, however, a number of errors, partly due to bad proofreading and partly to faulty handling of the statistical tables. We pointed out some of these in a notice of the book a year ago, and their inclusion in the current volume is inexcusable.

### ✱ Literary Notes

Two of the most interesting and important books recently published on social problems, W. J. Ghent's "Mass and Class" and Robert Hunter's "Poverty," are now issued by Macmillan in paper covers for 25 cents.

....The complete journals of the Continental Congress, 1774-1789, are being published by the Library of Congress, and all public libraries should secure the set. It is annotated by Worthington C. Ford, of the Division of Manuscripts. Three volumes have been issued.

....An abridgement in one volume of Farmer

and Henley's seven-volume work, "Slang and Its Analogues," is published by E. P. Dutton, New York (\$2.50). It contains definitions of some 10,000 words, which is as much slang as most of our readers will want to use. It is not up to date on its Americanisms, and needs to be supplemented by reference to George Ade.

....We congratulate *The Dial* on the successful completion of twenty-five years of critical work. On account of its unbiased and competent appraisal of books and the large amount of literary information it gives this semi-monthly Chicago journal has always been very useful to book buyers and public librarians.

### ✱ Pebbles

A little boy from Papua came  
Crying down the lane.  
Said I to him, "Come, little boy,  
Tell me, are you in pain?"

"I am so scared," he blubbered back,  
"Alas, that such should be!  
My father is the tattoo man  
And has designs on me."

—*Harvard Lampoon.*

....The editor of the *Gazette* has been accused of keeping liquor in his cellar. This is a malicious and unspeakable falsehood. The liquor is kept in the pantry between the dining room and the kitchen. Why not tell the truth? It is also alleged that the editor of the *Gazette* has the gout, caused by high living. Yesterday for dinner he had home-picked sourdough, mustard, dandelion, horseradish, beet-top greens, boiled bacon and potatoes, corn bread and onions. Would you call that high living? Another lie nailed!—*William Allen White in Emporia Gazette.*

....The coal we are using is peculiar. It has too much iron in it to be fit for slate, and too much slate to smelt it as iron. It has served the only purpose to which it can be put. It has been sold. Dr. Jordan was sick last week, but rather than take medicine, came out pretty soon. The people of Huntsville will have a week of prayer this week. The situation is pretty tough here, but we have not resorted to any drastic measures yet. Four fine days in succession, with roads drying out and river falling, makes us feel that we shall soon be in shape to live whether subscribers pay or not. Fish will bite soon. Marshall County did not roll up a very big Democratic majority, but her corn crop will be worth consideration. Some fool fellows cuss us for things we publish. Great Scott! They ought to know some of the things we do not publish.—*Guntersville (Ala.) Democrat.*

# Editorials

## The Canal and the Tariff

SOME months ago, Mr. Roosevelt earnestly desired that Congress should revise certain parts of the tariff law, believing that they had been outgrown and were being used by combinations of manufacturers as instruments of extortion. A considerable majority of the Republican Senators and Representatives made strenuous protest, and he was constrained to lay aside his project of tariff revision. But we may be sure that he did not cease to think of it. Now, in the performance of duties which Congress imposed upon him and which he gladly assumed, he makes a just decision which suddenly and forcibly brings before the American people those tariff abuses and wrongs which he in vain urged his party in Congress to attack and remove.

This decision is that the Panama Canal Commission shall buy material and supplies where they can be obtained at the lowest prices. An "unfortunate act," a Republican Senator is reported to have said, and one "certain to bring the party face to face with the tariff issue in its most dangerous form." Dangerous to whom? Not to the people; but unquestionably dangerous to the combined manufacturers in some industries who are extorting high prices from American consumers while selling at much lower prices to foreigners abroad.

The President, to whom full authority for the construction of the canal has been given, is bound to be reasonably economical in the management of an undertaking the cost of which must be an enormous sum. Our Government's expenditures for the current fiscal year have already exceeded its receipts by \$36,000,000, and new taxes are suggested. Mr. Roosevelt and his Commissioners find that the combinations which have been selling to foreigners at great discounts from their domestic prices are disposed to exact these domestic prices for material which the canal-builders must buy.

For example, steel rails are needed for the Panama railroad. The combination price to American buyers, a price exacted from all buyers in the United States, is \$28 per ton at the mill where the rails are made. Freight charges added would make the cost on the Isthmus not less than \$33. But the same protected American makers have been selling their rails to buyers in Africa, Arabia and elsewhere abroad, at \$22, and even at \$20, after paying \$8 out of their own pockets for freight charges. They have sold at almost as large a discount in Mexico and in Canada, and they would make similar concessions now for sales on the Isthmus if the French or the English were constructing the canal there. Must their own Government be required to pay \$33?

Thousands of small steel cars are needed for the work of excavation. The price of such American cars to foreign buyers is from 30 to 40 per cent. less than the price exacted here at home from the people who gave the manufacturers the tariff duties which enable them to exact it. If the French company were still at work on the Isthmus it could have the cars at the discount rate. Ought not our own Government, building the canal, to be treated with equal consideration? Mr. Roosevelt thinks so. These are examples which show how great is the difference between the home prices and the foreign sale prices of many American products, such as the Commission must have and must buy somewhere. Mr. Roosevelt prefers that they shall be bought from American manufacturers, but he insists that the prices shall be as low as those for which the same manufacturers sell the same goods to foreign buyers.

Two ships are needed. None of the right kind could be found for sale in this country. In a year and a half two could be built, and then they would cost \$1,400,000. But two British ships of the desired kind could be had at once for only \$750,000. At first it was decided

that these should be bought, but it is understood now that ships will be chartered for temporary use until Congress shall have had an opportunity to say what course must be pursued. Here again the export discount will not be overlooked. Our manufacturers have been selling to shipbuilders in England and Scotland the steel plates of which such ships are made at prices lower than those of the English steel manufacturers, and lower by about 40 per cent. than those which our own shipbuilders were required to pay for the same material. It is quite probable that the two offered at \$375,000 apiece were made of exported American steel.

During the last ten months more than \$400,000,000 worth of American manufactures have been sold abroad. The list includes many products of the kind that are needed in the canal work. They were sold in competition with foreign goods, and some of them in the countries where the competing foreign goods are made. If they can overcome such competition on the other side of the Atlantic, surely they can meet it on even terms in Panama. The President holds that they must so meet it there (as they do in other countries) or lose the trade.

His decision concerning these purchases for the canal is "dangerous" for certain protected and greedy combinations because it sets before the American people, with the authority of an utterance of the Government itself, the fact that they are compelled to pay for many protected products from 40 to 60 per cent. more than the prices for which the same products are sold to foreign buyers. Such exactions are made by means of the tariff duties and of combinations that prevent competition in the home market. A considerable part of each of the duties which we have in mind is not needed for any legitimate protective purpose. In some instances there is no need of any part of the duty. Proof of this is furnished by the export sales. Some of the combinations exist in violation of law. The Steel Rail Association is one of these.

Such protection as is given by these unnecessary duties and by the combinations formed to take full advantage of them is protection for the benefit of for-

eign buyers and for the robbery of American consumers. It should be ended. Some expect that Congress will decide that canal material and supplies must be procured from American manufacturers. But any attempt to compel the purchase of American material at the domestic combination prices must bring on a debate that will lay bare the whole system of extortion and force a revision of those duties by means of which this extortion is practiced. For such a debate the records of the Canal Commission will furnish interesting and useful facts.

### Progress of Public Ownership

OUR sympathies go out to those editorial writers of the trust-owned daily press who have to earn their daily bread by writing articles on the public ownership of public utilities. As intelligent men they know that their productions are fool stuff or—worse. We do not make the charge that these have been deliberately false. We say merely that if they have not been intentionally false, they have been remarkably ignorant.

Because it is entirely within the range of possibility for the editorial writers to know that the arguments which they have made use of in predicting municipal disaster if the subways of New York should be built and owned by the city, if the street railways of Chicago should be purchased by that municipality, if the gas works of Philadelphia and of Boston should become public properties, are not based upon experience. The American correspondent of the *London Mail* writes thus to his English readers:

"Mayor Dunne has declared that Chicago can obtain the money with which to buy out the companies and reorganize the whole vast system without the necessity for levying taxes; but it is believed that he is absurdly optimistic, and it is prophesied that Chicago before long may be groaning under such a weight of taxation that the citizens will curse the day when they decided upon municipal ownership."

To such misleading argument the *London Municipal Journal* makes this pertinent and telling reply:

"This is exactly the kind of thing written and talked in our own country ten and twelve

years ago. Now our opponents have for the most part switched on to the 'unfair competition with private enterprise' argument, which influences nobody except company directors and shareholders. Municipal trading here, so far from adding to the burden of the rates, relieves them."

The New York press, however, as yet is by no means so unscrupulous in its dealings with this question as are the newspapers of some of our smaller cities. In Boston, for example, an organization of citizens, including some of the most substantial business men of the town, has been unable to get the results of its investigation of the public service corporations published in the local newspapers and would have been unable to reach the public at all through ordinary channels had not the corrupt situation been fearlessly exposed by the *Springfield Republican* with a thoroughness that has spread consternation and panic throughout the ranks of the thieves and their newspaper hirelings.

There are, however, multiplying indications of an awakening public conscience. For the first time in many years the decent citizens of Philadelphia have found the courage to say and do something in opposition to the shameless corruption that has reigned insolently in that city. The vote of the Councils to give over the gas supply to a private monopoly for seventy-five years very nearly caused a riot, and there is reason to hope that when Mayor Weaver vetoes the measure it may be possible to prevent the consummation of the deal over his opposition.

Meanwhile, elsewhere than in the United States, the transfer of great public utilities to public ownership goes steadily forward. The Italian railways are being taken over by the state, and the municipal railways of London by the municipality. So thoroughly successful has municipal ownership proven in England that it can without reservation be said that the experimental stage there, as in Australia and in New Zealand, has been passed. That the English-speaking people of the world are able to manage great business interests through collective action, as they are able to maintain the institutions of popular government, is a demonstrated fact.

It is impossible to regard this progress with indifference. The future of democratic society depends upon it. Whatever power controls the biggest economic interests and agencies will control the political interests, and the law-making and administrative machinery. If great economic interests must be monopolized by a small group of business men, organized in private corporations, popular government is a failure. The only workable form of government becomes minority government, by an oligarchy or a dictator, more or less limited by potential popular revolt. If the people can collectively own the great public utilities, and collectively prescribe terms of operation, the people can also maintain the reality of popular or democratic government. The signs are many and promising that democracy is destined in this big struggle to win out.

### Simplified Spelling, French and English

WHAT are called the "twelve words" which have been suggested as an entering wedge in the way of simplified spelling are: *program, tho, altho, thoro, thorofare, thru, thruout, catalog, decalog, prolog, demagog and pedagog*. Of these, however, *thru* and *thruout* are not so much simplified spellings as they are phonetic spellings, and the inclusion of them in the list instead of the spelling *thro* was doubtless intended to suggest that the ultimate object to be sought is complete phonetic reform. THE INDEPENDENT has used eight of these twelve words and many others, and the National Educational Association and some learned societies have also adopted them in their publications. The movement for reform will have to come primarily through educational journals and learned societies, and an effort should be made to secure the corrected spelling in publications of National and State Governments and schools and colleges, so that the people may become used to the better forms, which are generally the older forms also. It is the learned class rather than the literary class who have led in the reform of the German spelling, and many years ago of the Spanish,

and are now attempting a reform of the French spelling; but in no language is the spelling so utterly corrupt as in the English. It is true French is as bad as English in the matter of silent letters and in the number of combinations of vowels used for the same sound, but it is more regular—that is, the words are more consistently misspelled. One can generally tell how a French word is pronounced when he sees it, altho it is often impossible to spell it from hearing it alone. The pronunciation of a French word, like the conduct of some men, depends on the company it keeps, but its behavior under any given circumstances is generally predictable. In English we must have formal introductions to unfamiliar words. You cannot tell what to call a word by its looks with any greater certainty than you can tell what to call a man by his looks.

In France, as in this country, the appeal for relief from chaotic spelling comes chiefly from those who most appreciate the unnecessary hardship which it entails upon each new generation—that is, the teachers. The present French Government is the most progressive the country has had for a century and in addition to the reforms which it is making in Church and State it has taken up the question of orthography. The Minister of Public Instruction secured the appointment of a commission of philologists, teachers and deputies to recommend improvements in spelling, and their report was published last fall. The most important of the changes proposed are: to replace final *x* by *s* as the sign of the plural, thus spelling *bijous* instead of *bijoux*; to use single instead of double consonants in such words as *ballet*, *ballon*, *collier*; to use *i* instead of *y* where it has the sound of *i*, as *analise* in place of *analyse*; to drop the *h* in *rh*, *th* and *ch*, and to substitute *f* for *ph*, thus writing *rapsode*, *téâtre* and *filosofie* instead of *rhapsode*, *théâtre* and *philosophie*; to replace *t* by *c* in such words as *aristocratie*, *nation*, *ambition*, spelling them *aristocracie*, *nacion*, *ambicion*.

All these changes would remove irregularities and inconsistencies in spelling and would in many cases restore the original and historic form. For example, is the Greek  $\phi$  to be represented by *f* or

*ph*? At present the French very inconsistently use *frénésie* and *phrénologie*, *fantôme* and *pharmacie*, just as in English we have *fantastic* and *phantasy*. Literary men lay great stress on the importance of showing the derivation of a word by its spelling, but their insincerity is shown by the fact that they object just as strongly to spelling *sulphur* with an *f* as they do *philology*. Of course, they know that sulphur is not derived from the Greek, but they prefer to deceive people on a point which they consider of such great importance rather than make any change whatever. The American Chemical Society recommends the forms *sulfur*, *sulfuric*, *sulfate*, etc., and uses them in its official publications, but literary men, who ought to lead in such matters, refuse even to follow in a reform based upon their own argument of historicity. The only principle they consistently hold to is that in spelling "whatever is, is right."

The French Academy, to which as the official adviser of the Government the report was referred, refused to approve it as a whole, but consented to authorize optional spellings in a list of 150 words, such as *rapsode* or *rhapsode*, *confidentiel* or *confidenciel*, *bijoux* or *bijous*, etc. The Academy in 1740 carried out some very sweeping reforms, but now it appears its members are more conservative. They insist on retaining the silent *p* in *temps* because it shows the derivation. They insist on retaining the *d* in *poid*, altho it is a late interpolation indicating a false derivation.

Fortunately the Academy is not so all powerful as it used to be, and even if it refuses to admit the reform spellings into its dictionary it will be a long time before people find it out. The academicians have been for over twenty-five years on the revision of their dictionary and are still at work on C. In comparison with this rate the Oxford Dictionary seems like a daily paper.

But it is a great gain to have optional spellings permitted. If the people have a choice the simpler and more rational spellings will prevail. It will be a case of the survival of the fittest. It is only by the constant exercise of the force of literary authority and conventionality that the people are kept from throwing

off the burden of our illogical, inconvenient and pedantic orthography.

### The Mikado as Attila

EMPEROR WILLIAM is unfortunate in the reports of his speeches. They are injudiciously frank, if he is not misrepresented, and he has to repudiate them. In one he was said to have declared that it was because the Russian army was enervated by alcoholism and immorality that it was defeated. In another, equally disclaimed, for prudential reasons, he likened the Japanese to "the scourge of God." They were brave; Providence had raised them up to punish Russian Christianity for its sins; but, like Attila, they were pagans to be dreaded and resisted. The whole sympathy of his address was with the Russians and against the Japanese. He was putting into a martial address what he had previously put into his cartoon of "the Yellow Peril." It was an attack on the Japanese for their race and their religion.

Let us think about it. Attila was "the Scourge of God." The title was given to him by a monk who so addressed him as ordained to punish the sins of Christendom, and he accepted the title. He ruled the East from China, over Southern Russia, the Balkan provinces, Hungary and Austria, and carried his armies over the Alps into France. In the year 451 he fought the famous battle of Chalons, which put an end to his western conquests. Leader of the Huns, he is counted most distinguished in the line of the kings of Hungary, and was the founder of its capital, Budapest. The Hungarians are Huns. He is a chief character of the Nibelungenlied. He was a rough, rude, bloody, mighty man, and murdered his brother on the throne, as Romulus murdered Remus. Possibly the neighboring empire, half of which is Hungary, will not like the style of William's attack on the Japanese. They are not ashamed of their Hun name and blood.

Japan is not a Christian country; it is predominantly Buddhist. Its leader, to whose virtue its armies credit their victories, is the Mikado. The Japanese are not like the Huns in any respect except

that they are non-Christian. They have education, culture, civilization. They are not barbarian nomads. They live in cities and till their grounds and cultivate the arts of peace. They are not one whit behind the Russians—they are far in advance of them in what we have been in the habit of calling our Christian civilization; for they have industrial skill, education and civil and religious liberty. They are as unlike the hordes led by the Scourge of God as can be imagined.

The Mikado "the Scourge of God!" Let us have more such scourges. Do we remember the last poem he wrote—think of Attila with that famous iron sword writing poetry as this:

"The foe that strikes thee, for thy country's  
sake,  
Strike him with all thy might.  
But, while thou strik'st,  
Forget not still to love him."

Let us think further about this modern "Scourge of God." The victory of Attila would have pretty much wiped out Christianity and Roman civilization. It was a barbarian irruption over Europe, to overthrow Greek civilization, Roman law and Christian faith. How different is the success of Japanese arms! They work liberty for Russia, the old seat of Attila's empire; have already given it liberty of worship, and promise civil liberty as well. They will assure the intellectual conquest of all Asia, and first of China. It is not barbarism but civilization that Japanese victory proclaims and extends. Think how much our great Caucasian race—or a part of it—has done for the world's development, with almost no help from any other race. But the victory of Japan means the doubling of civilizing power; the Mongolian joining hands with the Caucasian in the march of human progress, led, but following close beside. What may we not expect when the vast continent of Asia adds its mighty momentum to that of Europe and America! That will give us a new world indeed. And this is what the victory of the Japanese "Attila" means.

The Emperor William's address was shocking statesmanship, for it insulted his ally Austria, and also Japan, a Power with whom it is well to be on good terms. It was also bad morals, for it was an appeal to racial and religious jealousy

and hatred, and therefore it was bad Christianity. We will pit the Mikado's little poem against the German Emperor's speech, both addressed to soldiers, and ask which is the more Christian, and which smacks, or smites, more of the scourge?

### Non-Sectarian Education of Ministers

It was rumored some months ago that the Union Theological Seminary of New York City had thrown over the Westminster Confession, prepared a new creed to which Directors and Professors would be required to subscribe, and thus completely purged itself of even informal alliance with the Presbyterian Church. Precisely what had happened was not known until the authoritative statement of President Charles Cuthbert Hall made at the recent commencement in connection with the announcement of gifts to the Seminary during the year of \$1,400,000, including the sum of \$1,100,000 for removal to a new site on Morningside Heights, opposite Columbia University. In connection with his announcement of the new location of the Seminary in the academic center of New York City, in the immediate vicinity of the Teachers' College, the Horace Mann School, the Jewish Theological Seminary, besides Columbia and Barnard and also the Cathedral of St. John the Divine and St. Luke's Hospital, President Hall made it clear that the Seminary had made such changes in its rules as were necessary to fit it for the complete non-sectarian education of ministers. The institution was founded without provision for any ecclesiastical control whatsoever, but later yielded a measure of oversight to the Presbyterian General Assembly. This connection was broken in the trouble over Professor Briggs, and the Seminary resumed its old-time independence; but both Directors and Professors were still required to subscribe to the Westminster standards and thus to qualify in Presbyterian orthodoxy. Indeed, the pledge required of these officers was more exacting than that of the ordinary Presbyterian minister. The clergyman declares only that his present conviction is reasonably in

accord with the documents of Westminster, but the Union Professors, even Professor Briggs after he had become an Episcopalian, and Professor McGiffert when he was a Congregationalist, had to vow to maintain Westminster doctrine and to teach nothing that would impair it.

This was naturally found somewhat uncomfortable, even to the ecclesiastical conscience, and the rule of the Seminary requiring it has been abolished. Presbyterian ministers may still be Professors and Presbyterian elders may be Directors, and as a matter of fact it is probable that for many years the majority in both the governing and teaching bodies will be men of Presbyterian antecedents and sympathies. But the Presbyterian standards are no longer required tests for the institution, and the way is open for Congregationalists or Methodists or Episcopalians to become either teachers or Directors. In place of subscription to the Westminster Confession there is substituted a declaration of allegiance to the principles of the charter of the Seminary and of the pronouncement of its founders in 1836. Those are very mild and moderate documents, outspokenly new-school, and are in no sense a creed, their only doctrines being the doctrines of liberty and toleration held by liberal men of every age. This institution would appear therefore to have cleared its way for the absolutely free and non-sectarian education of Christian ministers, and it starts on its new path with traditions of high standards of scholarship and firm stand for liberty in teaching, with a very large endowment, and with the speedy promise of a commanding site in the educational center of America's greatest city, where within a few years 10,000 students will be gathered within the radius of a few city blocks.

The fortunes of one institution are of comparatively small moment, but the principle of theological education in an atmosphere free from even the suspicion of sectarian influence is of very great importance. In this good day it should be a commonplace that a teacher, and above all others a teacher of religion, should be bound only to teach the truth. A man

set to defend and maintain a particular system of dogma is to-day an anomaly. There can be no particular Presbyterian view of the truth which Amos brought into the world, and no special Baptist interpretation of the personality and work of the Apostle Paul. Three-quarters of the study of candidates for the ministry is in interpretation of the Bible and the history of the Church, subjects in which denominational bias were an imperitance. The lesser matters in which one needs preparation for service in a particular denomination, such as methods of government and the conduct of worship, are best learned by actual participation in the work of some Church; and in a non-sectarian institution this may be supplemented by lectures from eminent leaders in the several denominations from which the students may chiefly come.

There may be some lack of prestige for a young clergyman who does not hail from one of the favorite denominational schools, but more than a compensation will be found in the reputation for having pursued one's studies in the free, open air of untrammelled research, face to face with all systems and all theories that have challenged the world's thought, and a servant of the Church from conviction and not from lack of courage or force ever to break the denominational apron strings. There is talk in ecclesiastical assemblies of "safeguarding our seminaries." The world does not want "safeguarded" men, of "fugitive and cloistered" orthodoxy, and the action of Union Seminary, following the precedent of Harvard Divinity School, which under President Eliot has also become non-sectarian, should do much for the increase of respect for the ministry among thoughtful and educated people, and should hasten the day when it will be believed of ministers that according to their light and power they speak the truth, the whole truth, and nothing but the truth. The principle which demands the non-sectarian education of clergymen is the principle of all modern investigation and thought, and we look for its extending application in the decrease of the denominational and sectarian atmosphere in all institutions of learning, higher and lower.

## The Training of a Tyrannicide

"A gentle and sensitive dreamer, avid of all the emotions of art and thought, amorous of all the beauty of life, filled with a mystic yearning for the infinite, his fine and ardent nature charmed all who knew him."

IN these words a writer in the *Euro-péen* sums up his personal impressions of Ivan Platonovich Kalayev, who stained the pavement of the sacred Kremlin with the blood of the Grand Duke Sergius and who is now immured in its dungeon under sentence of death for his deed. When arraigned before the judges as an assassin he indignantly denied the charge. "I am not a criminal. I am a prisoner of civil war."

In person he is a man more the type of Robespierre than of Marat or Danton. Slight in figure, timid in manner, nice in his habits, dainty in his dress, blond, pale, with large blue eyes and a pleasant smile, this is the young student whose deed has made the Czar of all the Russias afraid to enter his own capital, and has banished or imprisoned in their palaces the Romanoff family.

The revolutionists with whom he associated were inclined to look upon him with some contempt because he stood aloof from their practical politics and did not share their ardent enthusiasms and radiant anticipations. At meetings where they were debating in the heated and intolerant manner of radicals and reformers everywhere some technical point in method or doctrine he would sit silent in his corner listening with his head on one side and faintly smiling at the wordy dispute; his air so detached that he was once suspected of being a police spy.

For party labels and questions of socialistic orthodoxy he had little regard.

"The old words have fatigued humanity too long. They are incapable of expressing all the complexity of the psychologic vibrations of the modern man."

When he was reproached by his altruistic associates for his inactivity and asked "How do you justify your existence?" he would admit his absolute uselessness in their busy world, but would add "I am my own I. Is not that alone a justification of my existence? I am a free man and I will be a slave of no one, not even of the masses."

In this he shows himself more a follower of Nietzsche than of Marx. Like so many young men of Continental Europe he had been strongly influenced by the Prophet of the Superman and he zealously preached his theories of esthetics and amorality. But he evidently fell into the common fallacy of anarchists, and, altho an apostle of the extremist individualism, he did not hesitate to invade the sacred boundaries of another's individuality even with a bomb.

The Russian autocracy is responsible for transforming the idealist into the revolutionist. If he had been allowed to write poetry, as he wished, he would not have meddled with politics. He was the son of a Russian manufacturer of harmonicas, but it was from his Polish mother that he first learned to hate Russia. He threw himself passionately into the "Young Poland" literary movement, writing poetry and translating from Polish for the Russian magazines, while still at the classical school. When he was expelled from the University of St. Petersburg he was banished to Ekaterinoslav under police surveillance. Here he supported his mother and younger sister, to whom he was devotedly attached, by working in a railroad office at 30 rubles a month. His work was so conscientious and efficient that his wages were soon raised to 50 rubles, a sum ordinarily received only after years of service. When, in 1902, he was arrested and imprisoned for two months as a suspect, his place was kept for him and his pay continued. While at Ekaterinoslav he engaged in university extension work and organized a system of free libraries. To complete his education he went to Silesia, where he became a socialist, and on attempting to return he was arrested by the Prussian police at the frontier and turned over to the Russian authorities and immured in a fortress. This was one of the cases brought up in the Reichstag when the attack was made on the Kaiser's policy of using the German courts and police to execute Russian laws. Of the two prisons Kalayev says he prefers the Russian, for in the German model institutions the treatment is more harsh and unmerciful. It was proved to the satisfaction of the authorities that he was not an anarchist when arrested; that he

might have been one when he was released does not seem to have been taken into consideration. The Russian Government preferred to educate him in its prisons instead of in its universities and it has been logically rewarded. It hardened his tender heart until it was ready to repay with violence, to "call aloud on Justice by her darker name." Until

"Love grows hate for love's sake; life takes death for guide.

Night hath none but one red star, Tyrannicide."

## Radiation Cures

NEWSPAPER science is proverbially fallacious. Newspaper medicine, according to a good old rule, always needs to be discounted at least 90 per cent. before it may be accepted as current funds of truth. As a matter of fact, tho scarcely a month passes without the proclamation in the newspapers of some startling medical advance, especially in therapeutics, no important bit of progress in medical science has ever found its way to the public by this avenue. The recent sensational reports with regard to the curative effect of radiation treatment in a special case of malignant disease that has been prominently before the public, much as we would all wish them to be true, are not unlikely to prove quite as groundless as previous announcements of similar character. Three years ago the reports of cases of malignant disease, both cancer and sarcoma, which had been treated successfully by the x-rays, were extremely common. Some of the best authorities in this important department of surgery announced a relief of symptoms and a disappearance of tumors that were simply inexplicable and marvelous beyond the dreams of previous therapeutics. The number of successes continued to grow for over a year and then the first hint of the possibility that these so-called cures were not permanent began to be bruited. At the end of the second year there were very few conservative observers who still continued to believe that the x-rays in any form gave hope of permanent relief for malignant disease.

Then for a time there was a reawakening of interest in the subject of radiation therapy because of the introduction of

radium and the fact that this metal lent itself to practical employment under definite conditions as to quantity and quality of radiation that had been impossible with the x-rays. Radium, however, soon proved to be even less permanently effective than had been the original radiation agent. Both of these means of radiation therapy do produce very definite effects upon cell life, and these effects are more noticeable upon the cells of malignant tumors than they are on the surrounding tissues. In no case, however, have they proved completely effective in eradicating malignant disease, except when the cancer formation was quite superficial and was of that slow running character which makes it amenable to many other forms of treatment besides radiations. There is not a single case of deep seated malignant disease on record which has been cured by the application of any form of radiation therapy. It has been suggested that radiation might well be employed to help the surgeon and prevent recurrences after malignant tissues had been removed. Even this claim, however, slight as it is, is not considered by the most conservative surgeons as justified by experience. While, then, we have in the various forms of radiation, which have recently been the subject of so much interest in physics, therapeutic agents whose limitations are as yet unknown, it may be said that observations made up to the present time do not justify the hopes of success in the treatment of malignant disease that have been suggested by recent newspaper articles.

One fact that makes the decision in this matter much more difficult than is usually considered is not recognized by the public. It is that sufferers from malignant disease may have a complete remission of symptoms for a time, during which they may regain most of their normal health. In cases of cancer of the stomach it has been known that after removal of a portion of that organ patients have gained 30 or 40 pounds in weight and yet after eighteen months to two years their malignant disease has proved fatal. Not infrequently fatality is brought about not by a recurrence of the cancer in its original location, but in some other portion of the body. Modern medicine is compelled to confess

that it knows no more about cancer at the present moment than it did fifty years ago, and one of the greatest philanthropic enterprises that could be encouraged, seeing the present increase in the death rate from cancer, would be the establishment of special institutions for the study of this dread disease, which carries off more and more promising lives every year.

### A Renaissance of Moslem Civilization

WHEN we wonder that Japan, a "pagan" nation, should have so easily and completely adopted and assimilated the best of what we call Christian civilization, we forget some rather important historical facts. We forget that it was a "pagan" nation, little Greece, that invented civilization, something higher than the semi-barbarous culture of Palestine and Egypt and Assyria. We forget that a high civilization crossed the Ægean to Asia Minor and the Adriatic to Italy; and that, under Roman law, it covered the eastern and the western world before there was any Christianity to adopt it. That was all "pagan." We also forget that there was a time when the world's highest civilization had wandered from the banner of the cross to serve under the crescent. In the time of the Abassids all learning and culture flourished most under Moslem rulers, and it was through Arab teachers that Christendom recovered its Aristotle. Europe learned from Averroes and Avicenna; and algebra and chemistry were Arab words that came with mathematics and medicine.

Then, in turn, with the Turkish rule Arab culture drooped, and has never risen; while the same century that cursed the world with the Turkish rule restored Greek learning to Europe. From that time to this civilization has been Christian, so that we had ceased to believe it could be anything else, until Japan has waked us out of our delusion and conceit.

Is a renaissance of Moslem civilization possible? Why not? There is no such thing as race in the capacity for civilization. It is achieved by one race today; it will belong to another to-morrow.

It may rest by the Ilissus for a season, may then cross to the Tiber, may then follow the Suevi, who wandered from the Southern Danube to the Baltic Sea, may search out the Gauls on the Seine and the Britons on the Thames, may return to the banks of the Nile and the Tigris, and may to-morrow, for aught we know, make its choicest home on the Yangtse or the Niger. To that goddess nothing foreign, nothing human, is alien.

And yet to expect civilization from the Turks seems almost as hopeless as to look for it from Malays or Negritos. It is from North Africa that we may look for Moslem culture, or, perhaps, from Arabia. Arabia is waking to new life. She is throwing off the hated Turkish yoke. Western influences are penetrating even into Yemen. Great Britain is herself the greatest of Moslem Powers. From India her annual pilgrimages sail in modern steamships to Jidda, only a brief journey to Mecca. From Egypt the great annual caravan moves by land down the eastern Red Sea coast. Half the sea coast of Arabia is now held by Great Britain. The same Power rules Egypt and the Sudan, and is building a railroad from Cairo to the Cape. France, too, has become a great Moslem Power. She holds Algeria and Tunis and all the rest of North Africa, except Morocco, as far as Timbuctu. With these influences a new spirit is entering into the Moslem world. There is even a "New Turkey," and out of Syrian schools a fresh impulse affects the Arab world.

There are three great Mohammedan universities, at Cairo, Tunis and Fez, all African, and another is being built up at Khartûm. Until very lately they have all been devoted to Mohammedan law and religion, and have fallen into ignorance and decadence.

But there is a class of educated Arab-speaking Moslems who wish modern ideas infused into these universities and they have formed a society called Khaldunia, after a famous Arab philosopher and historian, Ibn Khaldûn. At Tunis it has opened, with the university, courses in physics, history, geography and literature, such as might be had in Paris. Of course the old orthodox Moslems fear it all, and talk just like our friends of the Bible League; and the answer of the

reformers has an equally familiar sound. Thus talked a rash young man of twenty-five, son-in-law of the Prime Minister, at Tunis, where the Khaldunia had a public meeting:

"Science and religion are two separate things. One can honor them both with no fear that they will conflict. If there appears to be a contradiction between the conclusions of the one and the teachings of the other, it is not science that is at fault, nor is it religion; it is the interpretation given to religion. We must hold fast to what science teaches, and then correct the error in the science of religious interpretation."

Another speaker, in flowing robe and pure Arabic, told his hearers that the Egyptian Moslems are the most advanced in the world, and that their university is open to new ideas, and their reviews are circulated over the Arab world. Immobility, said he, is death; it is absurd:

"When our Prophet said: 'March without fear against the enemy with bow and lance,' he did not mean to forbid muskets and cannon. What is true in war is equally true in the realm of science, for religion does not exclude progress."

If this spirit prevails, and we see no reason why it should not, we shall in another generation see a new Moslem civilization, as we have seen a new Buddhist civilization in Japan, and are likely to see a Confucian civilization in China. But everywhere its spirit will be Christian, and its prevalence will, we think, mightily help the progress of the Christian faith. But Christian or no Christian, it is to be warmly welcomed.

#### The Council of Peace at Brussels

Last week the Executive Council of the Inter-parliamentary Union met at Brussels. America was represented by Congressman Bartholdt. The date of the thirteenth session of the Union was fixed for August 28th, and, as suggested by the American program, it was agreed to send invitations to all the American republics, so that they may be represented when out of The Hague Court a World's Parliament shall be organized. This meeting of the Council and the coming meeting of the Union may well be called Councils of Peace, meeting in the city

where a council of nations finally overthrew Napoleon after the battle of Waterloo, a few miles distant. We suggest that this Interparliamentary Union is now the proper center for the work of all our numerous peace organizations. It is the most imposing, influential and international of them all, composed of the very men who have to decide on peace or war. In this country two hundred members of our Congress have given their adhesion to it and are represented by Mr. Bartholdt. There are similar representatives of other Parliaments, many hundreds of them. Their leadership is practical, as is their plan for an International Congress which shall grow into an effective World Legislature, supplementing the World's Judiciary Court of The Hague.

#### May Meetings

This is the month for the coming together of the denominations. The Northern and the Southern Baptists, who have been so long apart, so that they have constituted two denominations, with separate mission boards, have held a General Convention in St. Louis this last week, and agreed to establish a united "General Convention of the Baptists of North America," to meet triennially. This is a magnificent achievement, altho the union is rather in the nature of a federation than of a consolidation. The union of the Cumberland Presbyterians with the Northern Presbyterians has been voted by the presbyteries of both bodies, but full union is delayed in order to see if some serious opposition, especially in the Cumberland Church, can be allayed. In the Presbyterian Church the opposition came from certain presbyteries that feared Arminianism, and from others which did not believe it right to accept the condition which shuts out the negroes in separate presbyteries and synods. There will be full and perhaps long deliberation before the full union is accepted. But a further step has been taken toward ultimate union of the Southern and Northern Presbyterian Churches, altho no final action has been taken. We publish elsewhere the report of the happy final decision

for close federation of the Methodist Protestants, United Brethren and Congregationalists, in the hope of full consolidation later.

#### Freedom of Biblical Research

Notwithstanding the mopping and damping of the Mrs. Partingtons of the Bible League the flood of criticism still advances, and cannot be checked. Nor is it desirable to check it by fulminations and prohibitions. There must be free investigation welcomed as to both Testaments, with a view solely to learn the truth. Cardinal Newman in his "Apologia" (p. 347) laid down a principle applicable to all Churches:

"As to the Catholic religion in England at the present day, this only will I observe, that the truest expedience is to answer right out when you are asked; that the wisest economy is to have no management; that the best prudence is not to be a coward; that the most damaging folly is to be found out shuffling; and that the first of virtues is to 'tell truth and shame the devil.'"

In England over a hundred clergymen of the Established Church have signed a pronunciamento, which will be sent to all to sign, in favor of an "authoritative encouragement" to the clergy to "face the critical problems of the New Testament with entire candor, reverence for God and his truth, and loyalty to the Church of Christ; inasmuch as "the historical validity" of the "details of New Testament narrative" "must ultimately be determined in the court of trained research." This means that we must apply the same methods to the investigation of the New Testament history that we do to that of the Old Testament, and must be no more afraid of the result in one case than in the other. In this country there is a growing protest against faith being controlled by creeds. This appears in the overture from a distinguished presbytery asking the Presbyterian General Assembly definitely to replace the standards by a simple statement of belief. It appears in the unwillingness in the Episcopal Church to try charges for heresy. It is seen in the Methodist Church, in the case of Prof. H. G. Mitchell, of the Boston University,

about whom the charges of heresy have centered for some years. The last General Convention voted that they did not find the charges of teaching doctrinal heresy in Boston University supported; but they directed the Bishops to consider any charges that might be brought before them. The case was considered in their late meeting, and they voted that while they did not find his teachings contrary to the teachings of Christ, they did find them contrary to the teachings of the Methodist standards, and on that ground they declined to take action confirming his re-election. As the rules require their approval this is tantamount to a dismissal. It is a curious conclusion, and one that will not make for harmony in the Church.

The leading Church of England journal allows a correspondent thus to slander conditions on this side of the Atlantic; and we suppose people will believe it:

"The American view is that the family cannot too early fling itself upon the community. It may not absolutely disperse, but it certainly does not cohere. It throws itself into fragments, and asks the community (for adequate remuneration) to supply each with its best professional attention. It asks that the community should give professional mothering to its infants (since natural mothers are only amateurs); it demands factory-made food, house-service done by contract, knowledge purveyed exclusively by the possessors of diplomas. It has an absolute distrust of the home-made; an implicit confidence in the hall-marked. The family is unmodern, and, like a five-story London house, must be broken up into separate pieces to meet present requirements."

Who has ever seen anything of the sort here?

The Jews are among the oldest settlers of this country and they will celebrate this year the two hundred and fiftieth anniversary of the permission given them to sail, trade and live in New Netherland. The Dutch had long been tolerant of the Jews, and cordially invited them here when they were driven out of Brazil on its conquest in 1654, after they had lived there for nearly a century under Dutch rule. But for fifty years they were refused certain civil and

political rights, were not allowed to engage in retail trade or to build a synagogue. Now our Jews are mostly Ashkenazim (Germans), while the Portuguese, who hold themselves as of older social heredity, are few. We see but a single name, that of Dr. H. Pereira Mendes, in the list of several dozen committeemen who are to arrange for the celebration.

Dr. Washington Gladden is quoted in an interview at Sioux City, Ia., as saying that as fast as financiers are shown by regular legal proceedings to have made their millions by oppressive and illegal methods the Church should and will refuse to solicit gifts from them or accept money for charity at their hands. Accordingly he says that future Congregationalists will neither accept nor solicit funds from Mr. Rockefeller, and that Mr. Armour is a likely candidate for the Church blacklist if the present investigation corroborates the charges against the meat trust. That doctrine may be acceptable in Iowa, but not in New Haven, if we may judge from the fact that of the dozen Congregational pastors in New Haven all but one have signed a paper approving the acceptance of the Rockefeller money.

The record of deaths by railroad accidents is bad enough in this country, and yet it is not so much worse than it is in countries where better protection is supposed to prevail. According to a consular report there were in Germany 4,480 deaths from this cause in the five years 1897-1901. This is an average of 896 per year for a population of about 55,000,000, or 16 per million of population. In this country for three months of 1904 there were 411 killed on railroads, or, at that rate, 1,644 in a year. But our population is about 80,000,000, which gives 20.5 per million. We have more grade crossings, but we invented safety brakes and couplings.

The Santa Clara aeroplane invented by Professor Montgomery is yet very far from being an airship, successful as it was in solving the great problem of balancing the aeroplane so that it would not overturn. It was taken up

by a hot air balloon, which was then cast off, while the aeroplane, with an impulse gained by a rapid fall, changed its course, moved forward and upward, turned circles in the air and descended safely. This was much, but it was mere equilibrium, with sails of bellying wings; and it is yet to be shown how an airship can be lifted by its own power and made to continue its flight.

No paper in the South has done more to condemn violence and lynching than has the *Charleston News and Courier*. It mentions one explanation of some brutal lynchings that we are sure is not generally known. It says of burning at the stake:

"This punishment was a judicial penalty a century ago in American colonies, that it was freely used in the South before the war, where negroes were concerned, and that its wide public knowledge to-day is due, not to a new appearance, but to a more complete news service."

It would be well to have further knowledge of the crimes as to which this penalty was inflicted.

Who own the streets? ask certain of the employers whose teams have been blocked by the Chicago strikers. It is a very proper question, and no man and no mob has the right to interfere with free traffic. But there is another side to the question. Who own the sidewalks? Are not the Chicago sidewalks blocked with merchandise to the detriment of foot passengers, against the law, and by these very men who so properly complain that horses are interfered with? We have observed that certain parts of Michigan Avenue are almost impassable because of the aggression of private business. Those that break the law have no right to complain of lawbreakers.

Secretary Morton, who knows all about it as an experienced railroad man who has had to administer the evil, thus lists the railroad wrongs which the President is trying to correct:

"The private sidetrack arrangements by which unfair inside rates have been enjoyed by some of the big industries of the country, the

earning of more than a fair return on private car investments, the payment of commissions of various sorts or rebates or preferential rates in any form ought to be entirely discontinued."

Mr. Morton does not go, however, as far as the President, who would have power given to regulate the rates also, and he is likely to leave the Cabinet later.

It is an interesting fact that we are becoming more a nation of coffee drinkers, while less a nation of tea drinkers. We consumed last year 961,000,000 pounds of coffee, which is about two-fifths of the total consumption of the world, and about twice as much as we did two years ago. Meanwhile we used last year 109,600,000 pounds of tea, which is about the same as ten years ago. England consumes more than twice as much tea as does the United States. Just as our substitution of beer for whisky reduces the evil, so coffee is less harmful than tea.

The report goes abroad that the notorious Nan Patterson is to go on the stage, having received a high offer to appear in a play. This is the kind of thing that keeps up the prejudice against the stage. It ought to be a teacher of good morals; but this is a woman whose attraction is that she was confessedly and vulgarly immoral, and who appears to have shot and killed her paramour. The public exhibition of such a woman is disgusting, and is a sad comment on the character of the public that cares to see her act. She has acted enough.

King Peter, of Servia, finds that murder of Kings for political promotion is not as pleasant as it was painted to him. He is likely to follow the way of his predecessor, if he does not hasten to return to his home in Geneva. What a pity that the Balkan States cannot unite.

Chinese merchants talk of boycotting American goods because of our exclusion laws. That is human nature, and is also a proper retribution. Our law is foolish and wrong.

## The Sixtieth Anniversary of the New York Life Insurance Company

SIXTY years ago, or, to be exact, on April 12th, 1845, Caleb S. Woodhull, William V. Brady, Herman W. Childs and Joseph B. Noues met in this city at No. 3 Nassau Street to organize the insurance company that has now become one of the "three giants," the New York Life Insurance Company. The celebration of the sixtieth anniversary of this event by the company began on May 23d, was continued on the 24th and 25th and will conclude on May 26th. The functional demonstration was attended by sixty trustees, officers and guests of the company, sixty agency representatives, sixty personal writers on volume business and sixty writers on number of applications. Of the various participating groups in the celebration of the company's sixtieth year of existence, forty-three are North American, twelve are European, and those from South American, Asiatic, African and Australasian districts number five each. Success in the securing of business was the qualification considered when delegates were selected. The celebration necessarily takes the form of a tribute to the President of the New York Life, John A. McCall, to whom and to whose administrative capacity, energy and pronounced enterprise the company owes so much. The matter of giving the celebration a diamond jubilee character and of distributing diamond souvenirs to agents was at one time under consideration, but this feature was abandoned.

In connection with the present celebration it is interesting to note that when the New York Life was established it was under the name of the Nautilus Insurance Company. In 1849, by virtue of an act of the Legislature, the name was changed to the present one. The chief asset at the time of organization was a blanket charter authorizing the new company to write life, fire, marine and inland transportation insurance. The organizers had applications for \$300,000 of insurance with which to begin business. They also had something like \$50,000 in subscription notes, but not one cent of actual cash. The trifling organization expenses were paid for with

borrowed money. Among the first 1,000 policies written by the New York Life were 339 on the lives of American slaves. Something of the company's progress is indicated by the fact that the last annual statement, which was issued on January 1st, 1905, showed assets of \$390,660,260. The total cash income for 1904 reached the enormous total of \$96,801,272.

## The Examination of the Penn Mutual Life Insurance Company

THE examination of the Penn Mutual Life Insurance Company of Philadelphia, asked for by resolution of its Board of Trustees under date of December 7th, 1904, which was begun on February 1st, was concluded on April 24th. The results have now been issued in pamphlet form. The insurance departments of Pennsylvania, Massachusetts and Wisconsin were jointly represented in the examination, which required the services of some fifty persons, and every detail of the business management, as well as the character and security of the company's assets, were subject to the closest and most exhaustive examination. The surplus was found to be larger by \$259,237 than that claimed by the company. The valuation of the real estate holdings was likewise found to be \$387,699 in excess of the sum included in the company's last annual report.

HENRY EVANS, President of the Continental Fire Insurance Company, who is the specially authorized delegate of the New York Board of Fire Underwriters to deal with the local water supply question, has written a letter to Governor Higgins favoring the new water supply bill now pending. Mr. Evans concludes his letter as follows:

"That the bill is not without defects is conceded, but it is the opinion of the New York Board of Fire Underwriters that the defects are comparatively insignificant; a liberal standard of criticism should now be applied in order that the proposed work should be at once begun. The bill as it stands is sufficient properly to accomplish the desired purposes; all minor considerations should give way to an urgent public interest, and the bill in its present condition should therefore be signed. I am, very respectfully yours,

"HENRY EVANS."

## Community of Interest Restrained

It is beginning to be seen that the "community of interest" principle was seriously affected by the Government's successful suit against the Northern Securities combination. The action required by the original decision in that suit was not clearly indicated until the final decision in the following litigation concerning a distribution of the Northern Securities stock assets was announced, in March last. Now we see community directors retiring from directorships which they can no longer lawfully hold. At last week's annual meeting of the Northern Pacific Company, E. H. Harriman, William Rockefeller and James Stillman were dropped from the board. Mr. Harriman is president and Mr. Rockefeller and Mr. Stillman are directors of the Union Pacific. They represent what are called the Harriman-Standard Oil interests. The fact that Union Pacific proxies were voted for their successors shows that they were not forced to retire. They withdrew in obedience to the laws of Minnesota, Wisconsin, Montana and Washington, as these are now defined or supported by the recent Northern Securities decision, which said:

"The Northern Pacific system, taken in connection with the Burlington system, is competitive with the Union Pacific system, and it seems obvious to us, the entire record considered, that the decree sought by complainants [the Harriman interests] would tend to smother that competition."

The laws of Minnesota forbidding a railroad corporation to control, by purchase or in any other way, a parallel or competing road, say:

"Nor shall any officer of such railroad corporation act as an officer of any other railroad corporation owning or having the control of a parallel or competing line."

By the decision of the Supreme Court the Union Pacific and Northern Pacific are competing systems. Therefore these directors withdrew from the Northern Pacific board. A sharp de-

cline of the stocks directly interested on that day (the 18th) was due in part to an erroneous impression that their withdrawal had been caused by a quarrel, and in part to a belief that values would eventually be depressed by this blow to the "community of interest" principle. But the Union Pacific still owns large quantities of Northern Pacific and Great Northern stock. It was for a similar reason, in part, that Mr. Gould recently withdrew from the Union Pacific board. He is building a parallel and competing line to the Pacific Coast. But it is well to remember that "community of interest" does not necessarily depend upon the presence of one and the same person in two or more boards. The letter of the law is obeyed in the new boards of the Great Northern and the Northern Pacific, but Mr. James J. Hill's son and his personal counsel are in the Northern Pacific board.

THE recent statement of the Lawyers' Title Insurance and Trust Company, of which Edwin W. Coggeshall is president and general manager, shows a capital stock of \$4,000,000, surplus of \$5,000,000 and undivided profits of \$631,984.09. The deposits are nearly \$10,000,000 and the total assets are \$20,124,048.75.

....The Northwestern Trust Company of St. Paul, of which Everett H. Bailey is President, and Robert R. Dunn Vice-President, has declared a dividend of 2 per cent., payable July 1st. The capital stock is \$200,000. The surplus and undivided profits are \$32,806, an increase of \$18,000 during the past year, or 9 per cent. of the capital. The total resources amount to \$281,000. The company does not receive deposits or do a banking business, but does a trust and agency business throughout the Northwest. Either the President or the Vice-President of every national bank in St. Paul is a director of the company.

....Dividends announced:

Buffalo & Susquehanna R.R., quarterly, Preferred, 1 per cent., payable June 1st.

Buffalo & Susquehanna R.R., Common, 1 1/4 per cent., payable July 1st.

## Survey of the World

### Secretary Taft's Address in Ohio

At Ohio's Republican convention, on the 24th, the most prominent figure was Secretary Taft, the temporary chairman, who is now regarded as a candidate for the Presidential nomination in 1908. For this reason, and because he so directly represented the President, certain passages in his long address have been carefully considered throughout the country. Concerning the Esch-Townsend bill for the regulation of railroad rates he said:

"It attempts to give more power to the Railroad Commission so that its orders, when made, shall be effective until set aside by judicial hearing. It does not as yet provide for a general fixing of a table of rates by the Commission, but only calls for a fixing of a maximum rate upon complaint with respect to a specific instance of injustice. It seems a moderate measure, calculated to give the added power to the Commission necessary to effectiveness for remedying specific wrongs in rates without creating an all-powerful tribunal which shall in advance take away from railways the power of rate-making and of elastically responding to varying conditions. It will not thus paralyze individual effort in meeting the changing demands of trade. We can certainly trust our lawgivers to respond to the popular demand and to regulate the railways, so far as they ought to be regulated, without interfering with that control over their own property and with that motive for efficient and economic management which are still required to make successful the enormous business of railway transportation in America. This question must be settled by the Republicans."

The history of the Republican party's sacrifices in favor of human rights, he continued, and of its "contest for in-

dividualism against socialism" proved that it was not a party of the corporation and of the rich. Mr. Bryan represented an element of the Democratic party that was hastening as rapidly as possible toward a doctrine in which vested rights are little regarded:

"He is now formulating a doctrine in favor of the Government ownership of commercial railroads, to which he hopes to lead his party. Against this proposition, I feel confident, the Republican party will set its face like flint."

This was an additional reason why steps should be taken to remedy railway abuses by an increased power of governmental supervision and regulation, "in order to meet the argument that Government ownership is the only cure." To meet the deficit in national revenue there were "two alternatives: either to impose additional internal taxes or to readjust and revise the tariff." It seemed certain, he thought, that the treaty with Santo Domingo would be ratified because its provisions were so equitable and the necessity for it was so great. There was some difference of opinion as to the extent of the Monroe Doctrine:

"The President insists that if the United States is to become responsible to Europe for the good conduct of the Governments of Central and South America, then it must be heard by those Governments when it demands that they put their houses in order and so avoid the just complaints of European Powers. The Monroe Doctrine is difficult to maintain at all events, and if we assert it as we do we should accept the obligations that follow the assertion of the right."

While Mr. Roosevelt did insist upon carrying a "big stick," he spoke softly

and exercised a degree of forbearance that the confidence of strength and a righteous purpose justified:

"In one of the South American Republics we are at present engaged in attempting to rescue the property of American citizens from what is said to be an unjust confiscation by the sovereign under color of judicial sanction. We have asked for arbitration and it has been refused, and we are waiting now only until Congress assembles before submitting the facts to it for its consideration. Meantime we are exercising toward this Republic all the forbearance that is due to a weaker nation."

We should hold the Philippines, he said, certainly for a generation, and probably for several generations, but they could never have the advantages to which they were entitled so long as a high tariff wall between them and the States was maintained.—Governor Herrick was renominated by acclamation. He denounced the "professional lobby" at the capital and promised to recommend legislation against it. The platform says that Congress "should so legislate that American ships, with American sailors, shall carry American products over all seas and through the Panama Canal"; that unjust discrimination at the ballot box, based on race, color, or previous condition, must not be tolerated; and that "no step should be taken that may imperil or threaten our good times." Commending every effort to enforce existing laws against Trusts and discrimination in railway charges, it favors such further legislation concerning this discrimination "as may seem to the Republican Congress and Administration to be wise and conservative."

#### Railway Rates and Canal Purchases

Neither in Secretary Taft's speech nor in the platform was any reference made to the purchase of Panama Canal supplies. On the 20th the Secretary gave to the press a statement that the Government's original decision as to such purchases had undergone no change. That decision appears to have been suggested by the price exacted for 7,000 tons of railroad rails. Mr. Drake, secretary of the Panama Railroad Company, says in an official letter that, altho the company

in June, 1904, bought American rails for \$21.75 per ton, the Commission was recently required to pay \$26.45 for 7,000 tons. It is asserted that the same rails, for export to Europe, could have been had for \$20. Public discussion of this question may have been the cause of the dissolution last week of the Steel Rail Association or Pool, which for several years past has maintained a price of \$28 for buyers in the United States. The Commission also bought 200,000 pounds of lead from a foreign house, whose price was far below that which American producers demanded. A well-known Washington correspondent asserts over his signature that it was the President himself who said that the Trusts must be "made to take their feet out of the trough."—Mr. Elkins's Senate committee has closed its inquiry concerning railroad rates. A large majority of the witnesses recently testifying were railroad officers. It is asserted in Washington that the committee, opposing the President's policy and the House bill, will recommend a decrease, rather than an increase, of the Commission's power over rates, but will ask that power be granted for a frequent examination of the railway companies' books, in order that discrimination may be detected.

#### A Reform Victory in Philadelphia

Owing to an extraordinary popular protest against the recent approval by the city Councils of a lease of the Philadelphia gas works for seventy-five years to the United Gas Improvement Company, the lease proposition was withdrawn by the company on the 27th. Mayor Weaver's veto had not been received by the Councils, but it was known that already the number of converted Councilmen was sufficient to sustain the veto at the approaching meeting. It had been an exciting week in Philadelphia. On the 23d, Mayor Weaver demanded the resignations of David J. Smyth, Director of Public Safety, and Peter E. Costello, Director of Public Works. These officers controlled the police and fire departments, the prisons, the inspection of buildings, the highways, the

cleaning and lighting of the streets, the water works and many public contracts. They insisted upon retaining their places until their successors should qualify, being confident that the Select Council would not confirm the Mayor's nominations. Therefore he summarily removed them, appointing in their places Col. Sheldon Potter, a lawyer, and A. Lincoln Acker, a merchant, both heartily in sympathy with the reform movement. At the same time he retained as his counsel ex-Judge James Jay Gordon, of Philadelphia, and Elihu Root, of New York, formerly Secretary of War. On the following day, Judge Ralston, of the Court of Common Pleas, granted a temporary injunction restraining the Mayor from removing Smyth and Costello, and another restraining Potter and Acker from taking the offices. On the 25th Chief Justice Mitchell granted a writ of special supersedeas permitting Potter and Acker to assume the duties of their offices pending an investigation by the Supreme Court. Chairman Winston, of the Committee of Seventy, setting out to engage counsel of equal rank with the attorneys retained by the advocates of the lease, found many prominent lawyers unwilling to serve, because of their relations with the Gas Improvement Company or its affiliated corporations. Therefore he employed counsel in New York. Many of the Councilmen who voted for the lease were subjected to ostracism and boycotting. They were pursued and publicly denounced; their wives were shunned by all their neighbors; in the public schools their children were pointed out by other children as the offspring of "gas thieves"; business patronage was withdrawn from them; they were hunted from place to place by automobile parties; innumerable messages by telephone and wire and the mails were showered upon them; their portraits and addresses were placarded in the streets and published in the newspapers. Many yielded to this pressure, and when the lease proposition was withdrawn others were ready to give their allegiance to the Mayor. Persons formerly associated with the politicians who supported the lease, but who have broken with them, assert that it was the politicians' plan to sell the water works and to promote a

combination of all the public utilities under private ownership and in one corporation. The reformers will probably make municipal ownership an issue in coming campaigns.—The law of New York, imposing special taxes upon the franchises of street railway companies and other public service corporations in cities, has been sustained by the Supreme Court. It was enacted while Mr. Roosevelt was Governor. The corporations declined to pay and appealed to the courts. In New York City alone the taxes overdue which now must be paid exceed \$24,000,000.

#### First Awards from the Hero Fund

The Commissioners of the Carnegie Hero Fund of \$5,000,000 made their first awards last week, giving medals to nine persons, two of these being young women, while three are the widows of men whose heroism is thus remembered. For the dependent relatives of the 59 persons killed by an explosion in a shoe factory at Brockton, Mass., on March 20th last, \$10,000 was appropriated. Awards were made as follows:

Mrs. Gideon King Marshall, of Springdale, Pa., whose husband, a carpenter, lost his life, on May 25th, 1904, in a well into which he had descended to rescue two laborers who had been overcome there by gas. A silver medal and \$500 to pay off a mortgage on her house.

Mrs. Seymour J. Leighton, whose husband, a machinist, 41 years old, was drowned, July 4th, 1904, in the Merrimac River, near Lawrence, Mass., while striving to save two girls who had been carried over a waterfall in a canoe. A bronze medal and \$600.

Mrs. Thomas H. McCann, of Portland, Me., whose husband, on June 29th, 1904, after great exertion saved a boy who had fallen into the water of Portland harbor, and then was himself drowned. A bronze medal and \$600 to satisfy a mortgage.

Miss Ernestine P. Atwood, a student 17 years old, of Melrose, Mass., who at great risk, on August 22d, 1904, while bathing at the ocean beach in North Weymouth, saved and brought to the shore a drowning man after he had gone down for the third time. A silver medal and \$500 for her education.

Miss Lavinia Steele, 27 years old, of Iowa City, Ia., who, on December 9th, 1904, at great risk rescued George E. Hill, a law student, who had broken through the ice while skating on the Iowa River. A bronze medal.

John J. Riley, 44 years old, a ticket seller on a steamboat, who, on August 15th, 1904, dived from the end of the Iron Steamboat Company's pier at Coney Island, and saved August Rolke, 48 years, who had sought to commit suicide by drowning. A bronze medal.

John J. Healy, 24 years old, hospital attendant at Ellis Island, New York Harbor, who saved from drowning Agnes Strobel, who had leaped into the water to end her life. A bronze medal.

Louis J. Bauman, 17 years old, of Rodi, Pa., who, on July 17th, 1904, dived three times to rescue a drowning boy, and finally succeeded in dragging him under water to the shore. A bronze medal.

Alexander Cameron, 27 years old, a painter, of Lindsay County, Ontario, Canada, who saved a boy from drowning in the Scugag River, and suffered greatly thereafter from exhaustion and nervous shock. A silver medal.

The Commissioners have had under consideration 405 cases; 239 have been rejected, a majority of these because the events took place before April 15th, 1904, when the Fund was established; 159 are awaiting investigation. It must be shown that life was voluntarily risked.

#### **The Teamsters' Strike in Chicago**

Owing to the attitude of the seven express companies, who refused to take back any of their drivers (because they had broken their contracts), no progress was made last week toward a settlement of the teamsters' strike in Chicago. The lumber trade became involved because of the discharge of the lumber companies' teamsters who refused to deliver lumber to the boycotted stores and factories. There was but little rioting. The sheriff had 3,600 deputies on duty, and the police force had been augmented by 3,000 special patrolmen. Governor Deneen informed Mayor Dunne that if troops were needed he could have a sufficient number on hand in two hours. At the end of the week the strikers felt the discouraging effect of action taken by the Associated Building Trades. These union organizations, controlling 30,000 workmen, formally resolved to stand by their contracts and to do nothing that could draw them into the controversy. This indicated a loss of both moral and financial support. The teamsters sent agents to Eastern cities to raise money

and also to ascertain whether the drivers employed by the express companies in those cities could be induced to strike in sympathy. In the cases of the union leaders who were required to show why they should not be punished for contempt of court, Judge Kohlsaot ruled that President Shea might decline to answer, because, as he was under indictment, his replies might incriminate him or work to his disadvantage in the indictment prosecution. But no such plea was accepted in the cases of several other union officers, who were found guilty of contempt and sentenced to be confined in jail. They were allowed to be at liberty for five days, however, in order that their counsel might make due preparation for action to be taken in their behalf.—Seventeen boys who had been leaders in the public school strikes were committed to correctional institutions. It is asserted in Chicago that the school strikers were encouraged by some of their teachers, whose organization or union is affiliated with the Federation of Labor. The Federation adopted resolutions declaring that it would stand by the children who went on strike; that "if necessary for their vindication" it would withdraw all of the union members' children "from the corporation-controlled schools," and that it would appeal to the Supreme Court for the liberty "of the highest type of childhood to-day."—In New York about 12,000 excavators and rockmen are on strike for higher wages and for recognition of their union. For this reason work upon the foundations of several hundred buildings has been suspended.—Judge Morrow, of the Circuit Court, has issued, in San Francisco, an order restraining the California Federation of Labor from boycotting the products of a hat factory in Danbury, Conn.—In Quincy, Ill., eight leading officers of local unions have been indicted for boycotting a laundry company. One of the indicted men is a member of the Board of Education.

#### **Cuba and Porto Rico**

Gen. José Miguel Gomez, Governor of the province of Santa Clara, was nominated for President by the National-Liberal convention, apparently without any serious opposition, but a consider-

able number of delegates who preferred Governor Nunez (of Havana province) did not vote, having asked in vain that action be deferred on account of the illness of Gen. Maximo Gomez, the old revolutionist leader, who is Governor Nunez's foremost supporter. Owing to the disaffection of these delegates, the Moderates (who will nominate President Palma) may offer to Governor Nunez the second place on their ticket. It is said that if Governor Gomez should be elected he would seek to procure from the United States a modification of the restrictions of the Platt Amendment.—An official statement covering recent calendar years shows that Porto Rico's imports have grown from \$10,955,813 in 1901, to \$14,135,061 in 1904, and her exports, in the same period, from \$10,472,270 to \$17,043,932. Since 1898, her imports from the United States have increased from \$1,404,000 to \$11,934,000, and her exports to the States from \$2,382,000 to \$12,963,483. Since 1901, trade with the States (imports and exports) shows an increase of about \$9,000,000. The bulk of Porto Rico's sales to us consists of sugar and cigars; in the list of products bought from us by the islanders the most prominent are cotton goods, iron and steel manufactures, flour, pork, lard, ham and lumber.—The proprietor of a stage line of automobiles between Camuy and Aguadilla (a gap of 27 miles in the railway system of Porto Rico) seeks an exclusive franchise for daily automobile service across the island from San Juan to Ponce, promising to use large machines, and to charge passengers only 5 cents a mile. His stages have not missed a day's service for a year, and none of his 7,442 passengers has been harmed. A stage carrying 18 persons has sometimes drawn a trailer with 1,500 pounds of mail over the hilly roads of his route. The time from San Juan to Ponce by public carriage is now 13 hours. He would make it 9 hours. San Juan's Chief of Police during the riots crossed the island to Ponce in 5 hours.

#### The Swedish-Norwegian Dispute

The controversy between Norway and Sweden on the question of a separate consular service has

reached a crisis and in the present irritable temper of both parties no reconciliation seems possible. The Crown Prince Gustaf, who since February 8th has been acting as Regent, exerted his strongest influence to secure a compromise and in his address to the Mixed Council, representing the Swedish and Norwegian Governments, he requested them to negotiate an amicable arrangement for a separate consular service under a single Foreign Minister. The Norwegian Government, however, refused to agree to a renewal of the negotiations, for these had often been tried in the past and proved fruitless. Norway held that the right to a separate consular service belonged to her as a sovereign country prior to the union and was guaranteed by the constitution, and it was the determination of the Government to carry this into effect at once without waiting for the consent of Sweden and regardless of its effect upon the Union.

"In these circumstances the Norwegian Government find it advisable that no negotiations should be entered into regarding the Union until the establishment of a Norwegian consular service has been carried through. Only after this has taken place will the confidence necessary for friendly and fruitful negotiations regarding the delicate and difficult question of the Union be restored and the Government be able to advise the resumption of negotiations for regulating foreign affairs, diplomacy and the general conditions of the Union as established by the Rikssakt. But these negotiations must in that case be entered into on a perfectly free basis, with full recognition of each country's sovereign rights without restriction or limitation of independence as in 1808, and Norway's proposal must be admitted that there may be a separate Norwegian and a separate Swedish Minister for Foreign Affairs appointed on such conditions as each of the two countries may severally determine. It must also be understood that if the negotiations lead to no result a return to the *status quo* and the present untenable condition of the Union is not to be the consequence, but each kingdom shall have the right to decide on the future forms of its national existence."

Accordingly a bill was passed by the Storting providing that Norwegian Consuls-General, Consuls and Vice-Consuls, paid and unpaid, shall be appointed and placed under the direction of the Norwegian Government. The law is to take effect April 1st, 1906. The bill was

presented on May 27th to King Oscar, who resumed the throne on that date in order, it is said, to avoid burdening his successor with the odium resulting from the refusal of the Norwegian desires. The King declared that he could not assent to the law because the existing arrangement was established by a resolution of the Mixed Council and could only be disturbed by the Mixed Council. His love for both people impelled him to refuse his sanction. Each member of the Norwegian Cabinet personally urged the King to consent to it, and when it was seen that his resolution was unalterable they all presented their resignations. King Oscar declined to accept them, but the Ministers insisted on the ground that the King's veto of a unanimous decision of the Cabinet, voicing a pressing demand of the whole Norwegian people, was a violation of the constitution and invasion of the rights, independence and sovereignty of Norway. The Ministers refused to counter-sign a protocol of the proceedings. Under the constitution the King's veto is a limited one, and if the Norwegian Parliament passes the act twice more it will become a law without the King's signature. A separate consular service will involve a Norwegian Minister of Foreign Affairs, and the only bond of union between the two countries would be the person of the King. The Norwegians seem willing to accept all the responsibilities of complete independence, and Dr. Sven Hedin, the great explorer, speaking for Sweden, declares that no effort will be made to keep Norway in the Union, nor, in the event of separation, will a single drop of Swedish blood be sacrificed to defend her from invasion by Russia or any other foreign Power.

#### Meningitis in Europe

New York is not alone in suffering from epidemic cerebro-spinal meningitis this spring. In England, France, Germany, Austria and Russia the disease has been unusually prevalent and virulent. During the first three weeks of May there were in Prussia 1,935 cases and 994 deaths; in Silesia, 1,814 cases and 932 deaths. The greatest ravages have been among the soldiers in the barracks. The garrison in Essen was one of the first at-

tacked, and the men going to their homes for the Easter vacation spread the disease throughout Westphalia. The soldiers were recalled. In 1837 a similar epidemic broke out among the soldiers in Bayonne, killing many. The soldiers who were dismissed to their home carried the contagion with them into the country, creating many local epidemics. No cure is known; hot baths and antispasmodics, such as chloral and sulfonal, are used as treatment.

**In Russia** Ivan Kaleyev, who assassinated the Grand Duke Sergius in the Kremlin of Moscow February 17th, was hanged on the morning of May 23d. He consented to see a priest, but asked that it be officially recorded that he received him as a man, not as a priest. On the scaffold he said:

"It has been reported that I asked for pardon. That is a lie. I am faithful to the tradition of the People's Will. I do not ask any favor. I am glad to die."

The People's Will is the name of the revolutionary party with which he was formerly associated.—Riots of an unusual character occurred in the ghetto of Warsaw May 25th, 26th. The Bund, or Jewish Socialist Society, determined to rid the city of all the disreputable Jewish resorts which have been flourishing under police protection because of the blackmail they paid. Since it was impossible to abolish them legally the respectable Jews resolved to take the law into their own hands and wipe out this stigma on their race. The raid was conducted in a systematic manner. The houses marked for destruction were broken into and all the furniture and other property thrown into the street and smashed. The inmates were beaten, or, if they resisted, were shot. Ten or twenty persons were killed in the riots and a hundred wounded. Several hundred brothels, *cafés* and flats were gutted. Pianos, mirrors, costly furniture, works of art and jewelry were thrown from the windows and completely destroyed. No stealing was permitted. Some of the Gentile resorts were raided at the same time by bands of Gentile Socialists. The city officials looked on without interference, but on the afternoon of the second day troops were ordered to sup-

press the rioting. They fired upon the mob, wounding three persons.—In the Caucasus the race war between the Armenian Christians and Mohammedans has again broken out and in several villages there have been riots with considerable loss of life. Prince Nakashidze, who as Governor of Baku was popularly supposed to be responsible for the Baku massacres, was killed by a bomb thrown at his carriage. The officer in command of his Cossack guard and a bystander were also killed; the driver and others were injured.—The Chief of Police of Siedlce, a town 50 miles southeast of Warsaw, was mortally wounded by a bomb while he was sitting on the veranda of a clubhouse after the theater. The thrower of the bomb escaped. In Odessa the police discovered a bomb manufactory. Under the flagging of the cellar 137 nearly completed bombs were hidden.—The workmen in a private ammunition factory at Tala sent in a petition to the Ministry of Justice, saying that poor material was being used in the cartridges manufactured. The workmen struck rather than turn out such ammunition that would be useless or dangerous to the troops in Manchuria. The factory had secured a Government contract for 15,600,000 cartridges.—Many Poles are taking advantage of the Czar's recent ukase granting religious freedom and abolishing the religious disabilities of the Roman Catholics to throw off their nominal allegiance to the Orthodox Russian Church. In the Governments of Lublin and Siedlce 26,000 persons are reported to have deserted the Greek for the Roman Church in the past few weeks. In one village of 680 inhabitants, 678 changed to the Roman Catholic faith. This has so incensed and alarmed the authorities of the Orthodox Church that strong pressure is being brought to bear upon the Czar to put a stop to the movement.

#### The Great Sea-Fight

The greatest naval engagement of the world's history was fought May 27th, 28th in the Korean Strait, near Tsushima, and the Russians were overwhelmingly defeated. The route taken by Admiral Rojestvensky after finally leaving the coast of French Indo-China, about May

16th, has not been clearly disclosed. On May 22d the Russian fleet is said to have coaled off the coast of Luzon, of the Philippines. Then it passed through Bashi Channel between Luzon and Formosa. On May 25th several of the transports and slower vessels appeared at Shanghai, having been detached from the main fleet, which continued on to the northeast, toward Korea Strait, after taking on some supplies from the boats awaiting it at Saddle Islands. Three of the volunteer vessels ascended the Yangtse-Kiang (Yangtse River) in the night of the 25th without showing lights and anchored off Wusung. The Taotai or Chinese Governor of the city protested to the Russian Consulate against the presence of Russian vessels of war in the port and ordered them to leave within 24 hours. The transports and colliers were allowed to remain. The volunteer cruiser "Dnieper" was reported near Barren Island May 29th. It is reported from Tokyo that an American merchant steamer was sunk off Formosa about May 21st by Admiral Rojestvensky, to prevent the knowledge of his movements being conveyed to the enemy. The crew was saved. The United States Government has requested information from St. Petersburg as to the affair, as such action is entirely unwarranted by international law. Korea Strait, where the battle was fought, is divided into two channels by Tsu Island (Tsushima), which is 37 miles long and situated about half way between Fusan in Korea and Shimonoseki in Japan. Each channel is about 25 miles wide. The invasion of the continent was begun here by the Japanese throwing troops across this strait into Korea at Fusan and Masampo, and here Admiral Togo's fleet has kept nearly all the time to protect this vital communication between the troops in Korea and Manchuria and their source of supplies in Japan. Here the Vladivostok squadron was attacked by Admiral Kamimura August 12th and the "Rurik" was sunk, and the "Gromoboi" and "Rossia" escaped to Vladivostok, where they have since remained. Admiral Rojestvensky, instead of attempting to dodge the Japanese fleet by making his way around Japan to Vladivostok, where he might have been shut in like the Port

Arthur fleet, determined to strike a blow at the center of the naval strength of Japan. The Russian ships approached Tsu Island in the night of Saturday, May 27th, under cover of a fog and were discovered early in the morning when the fog lifted. Admiral Togo attacked Saturday afternoon, the fighting continued Saturday night and Sunday, and resulted in the practical destruction of the Russian fleet. Two of the Russian battleships, the "Borodino" and the "Alexander III," were sunk and three

battleships, while the Japanese had only four, and since modern naval opinion places the main dependence upon battleships the Japanese fleet was theoretically inferior, notwithstanding its numerous cruisers and torpedo boats.

#### The Yacht Race

The Transatlantic Yacht Race, in which American, German and British sailing vessels competed, was won by the American yacht "Atlantic," which completed the course from Sandy Hook to the

others, the "Orel," the "Sissoy Veliky" and the "Nikolai I" were captured. The armored cruisers "Admiral Nakhimoff," "Dmitri Donskoy" and "Vladimir Monomach" and the protected cruisers "Svietlana" and "Jemtchug" were sunk. The Russian flagship, "Kniaz Suvaroff," was seriously damaged. Altogether nineteen of the Russian vessels were lost. Three thousand Russians were taken prisoners, among them Admiral Nebogatoff, who brought the last division of the Baltic squadron to the Pacific. Admiral Togo reports that the Japanese fleet escaped injury. The two fleets were nearly matched in nominal gun power, but the Russians had eight

Lizard at 4 p.m. May 29th, thus making the time 12 days, 7 hours and breaking the record. The best previous record is 13 days, 20 hours and 36 minutes, made in 1891 by the "Endymion," which also competed in this race. The "Atlantic" was owned by Wilson Marshall, of the New York Yacht Club, and was sailed by Captain Barr, who in charge of the "Columbia" has twice defended the America's cups. The "Atlantic" is a three-masted auxiliary schooner and the newest of all the yachts entered. The Kaiser's Cup will, therefore, come to America, which still holds the international championship for either short or long distance racing.

# A WHITTIER IMPROMPTU.

By JOHN GREENLEAF WHITTIER.

[A bevy of merry girls, daughters of Whittier's Amesbury neighbors, accompanied him on one of his summer visits to the Bearcamp region, at West Ossipee, N. H. Toward sunset, one day, they were seated on the bank of the river, and the young lady with the "quaint name" (Miss Jettie Morrill, the same young friend for whom Whittier wrote "The Henchman" and "The Voyage of the Jettie") asked Whittier to improvise a poem suggested by his surroundings. These lines were composed upon the spot, and I have them as repeated from memory by one of the party. They were never before in print.—SAMUEL T. PICKARD, Amesbury, Mass., May, 1905.]

The Bearcamp's pleasant banks upon,  
I sit like gray Anacreon,  
And, happy as the Greek of old,  
I watch the sunset's paling gold,  
And mark the change of mountain mist  
From blush of rose to amethyst.

No chain of roses 'round my head,  
But smiles of merry girls instead;  
For Samian wine from flagons poured,  
I've sweetmeats from the private hoard  
Of one to whom is fitly given  
The sweetest name of earth or heaven;

And of one other, young as yet,  
And fair as spring's first violet;  
And one whose quaint name half belies  
Her fair brown hair and soft blue eyes,  
So ringed about with laughing youth,  
I quite forget my gray hairs' truth.

The shadow of my life's long date  
Runs backward on Time's dial-plate;  
I feel as when my youth began—  
The boy still lives within the man.  
I count myself like yonder tree,  
By many winters mossed and worn,  
Girt by its goodly company  
Of flowers, and so not all forlorn.

*George E. Cleveland May 20, 1905*

# A Word Concerning Rabbit Hunting

BY GROVER CLEVELAND

EX-PRESIDENT OF THE UNITED STATES

BECAUSE rabbit shooting is seasonable only in late fall or winter weather the mention of it is calculated to suggest shivering chills, cold feet, numb fingers and all sorts of heavy clothing. At first blush, therefore, it may not seem to be exactly an appropriate topic to be given a place in a magazine designed for midsummer reading. On second thought, however, I hope it will not be deemed amiss that the torridity of such a magazine should be tempered by a cooling admixture hinting of recreation free from dog-day swelter, and reminding the reader that a season is on its way which brings with it outdoor sport exempt from summer heat and unvexed "by the stings and arrows of outrageous" gnats, flies or mosquitoes. It is quite within reason to suppose that the addition of rabbit hunting to the ingredients that simmer in summer recreative reading might be as refreshing as the addition of ice to an otherwise tepid summer tipple.

Some hunters there are, of the super-refined and dudish sort, who deny to the rabbit any position among legitimate game animals; and there are others who, while grudgingly admitting rabbits to the list, seem to think it necessary to excuse their concession by calling them hares. I regard all this as pure affectation and nonsense. I deem it not beneath my dignity and standing as a reputable gunner to write of the rabbit as an entirely suitable member of the game community; and in doing so I am not dealing with hares or any other thing except plain, little, every day plebeian rabbits—sometimes appropriately called "cotton-tails." Tho they may be "defamed by every charlatan" among hunters of self-constituted high degree, and despised by thousands who know nothing of their game qualities, I am not ashamed of their pur-

suit; and I count it by no means bad skill to force them by a successful shot to a topsy-turvy pause when at their best speed.

These sly little fellows feed at night, and during the day they hide so closely in grass or among rocks and brush that it is seldom they can be seen when at rest. Of course, no decent man will shoot a rabbit while sitting, and I have known them to refuse to start for anything less than a kick or punch. When they do start, however, they demonstrate quite clearly that they have kept their feet in the best possible position for a spring and run. After such a start the rabbit must in fairness be given an abundant chance to gain full headway, and when he has traversed the necessary distance for this, and is at his fastest gait, the hunter that shoots him has good reason to be satisfied with his marksmanship. I once actually poked one up and he escaped unhurt, tho four loads of shot were sent after him.

In the main, however, dogs must be relied upon for the real enjoyment and success of rabbit hunting. The fastest dogs are not the best, because they are apt to chase the rabbit so swiftly and closely that he quickly betakes himself to a hole or other safe shelter, instead of relying upon his running ability. The baying of three or four good dogs steadily following a little cotton-tail should be as exhilarating and as pleasant to ears attuned to the music as if the chase were for bigger game. As the music is heard more distinctly, the hunter is allowed to flatter himself that his acute judgment can determine the route of the approaching game and the precise point from which an advantageous shot can be secured. The self-satisfied conceit aroused by a fortunate guess concerning this important detail, especially if supplemented

Mr. Cleveland Leaving "Westland," His Princeton Home, with His Nearest Neighbor, the Late Colonel Samuel W. Stockton, for a Day's Shooting

by a fatal shot, should permit the lucky gunner to enjoy as fully the complacent pleasurable persuasion that the entire achievement is due to his sagacity, keenness and skill as tho the animal circumvented were a larger beast. In either case the hunter experiences the delight born of a well-fed sense of superiority and self-pride; and this, notwithstanding all attempts to keep it in the background, is the most gratifying factor in every sporting indulgence.

Some people speak slightly of the rabbit's eating qualities. This must be an abject surrender to fad or fashion. At any rate it is exceedingly unjust to the cotton-tail; and one who can relish tender chicken and refuse to eat a nicely cooked rabbit is, I believe, a victim of unfounded prejudices.

Why, then, should not rabbit hunting, when honorably pursued, be given a respectable place among gunning activities? It certainly has every element of rational outdoor recreation. It ministers to the most exhilarating and healthful exercise; it furnishes saving relief from care and overwork; it is free from wantonness and inexcusable destruction of animal life, and, if luck favors, it gives play to innocent but gratifying self-conceit.

Let us remember, however, that if rabbit hunting is to be a manly outdoor recreation, entirely free from meanness, and a sport in which a true hunter can indulge without shame, the little cotton-tail must in all circumstances be given a fair chance for his life.

WESTLAND, PRINCETON, N. J.

# LAND CRUISING

*By Augustus Post, Chairman of the Touring Committee of the American Automobile Association.*

WHEN one goes cruising on his own yacht his joys are varied as he can pass from point to point, running in at this bay or that river, visiting this, that or the other city, and stepping ashore to get the feel of the land again.

But still there is a great deal of monotony in yachting. Practically the scenery is always the same. Far as the sight stretches to-day is the sea that rolled about one yesterday, with the line

of the horizon as its only boundary. Matters of interest are few and one learns nothing new about the world and its people.

Not so with land cruising in an automobile, or touring, as it is called. The scenes are constantly changing as the car flies along. Now the country is hilly, now gently rolling, and again, flat, with all the fields of growing things, backed by the woods, spread out in panorama. One gets very close to nature, and to him

Augustus Post, Land Cruising

Mr. Jay and Mr. Post on a Fifteen Horse-Power Car with a Record of Fifty-one Seconds

she displays all her wonders and beauties. He has the power of the bird to swoop and soar and observe, with the mind of the man to speculate and understand.

Towns, villages, cities appear and disappear, all busy with their little affairs, each thinking that its own personal hum is the voice of the world. The land cruiser sees a deal of human nature.

Close to the cities, where automobiles are common, some of the manifestations are apt to be unpleasant as the honest rustics of the constabulary and the local bench, being ingenious and thrifty, sometimes seek to turn touring into a commodity for their marketing. Thus they station men at intervals with stop watches, hiding them behind trees. The automobilist is forced to stop on account of a furniture van pulled across a narrow road, or some such obstruction, and he finds himself in the hands of—well, call them tax-gatherers.

There are the constable and assistant constable and some deputy constables, all honorable men and horny handed sons of toil, with their testimony carefully rehearsed; and from some shady nook, hard by, they produce the venerable justice of the peace, dispenser of the laws, who holds his court beneath the spreading greenwood tree and fines the automobilist enough to make the day's work profitable for all hands except the man who pays.

It is a scene of sweet arca-dian beauty and the glimpses of human nature displayed by the ruralists in pursuit of the dollars go far to compensate a tourist whose temperament is properly philosophic. From ten to twenty-five dollars is the usual price of admission, for, as the venerable gentleman who presides on the imaginary bench declares:

"By gum, these here city fellers hes got ter unnerstan' thet they can't do no sky-hootin' thro' our taown. No, sir!"

But such adventures as these are only met with on the outskirts of the big cities, in shoal water, as one might say.

When one cruises out into the blue water of the real ocean of country he finds no such set traps, and the authorities are not seeking to exploit him.

There are, of course, two sides to the question of automobilists' fines. Automobilists in the past have broken laws, done damage and cost lives by their recklessness; but at the present time I believe they are more often sinned against than sinning. The ruralists imagine that the man who has an automobile must naturally be rich enough to stand a squeeze, so they gather him in as a part of the season's crop.

It is not only the constables and the justices who in some instances seek to flourish at the expense of the folks who travel in the new fangled machines. Mine jovial host of the wayside inn is of the same mind and is apt to bite hard

Bodin's Car, Which Made a Mile in Thirty-two and Two-fifths Seconds

if given the opportunity. A horse, which eats oats and hay, can secure board and lodging for the night for 50 cents, while the automobile, which carries its own provision, must pay \$1. The charges for towing an automobile are also very high.

However, all this is only in the neighborhood of the cities, and it is growing less and less pronounced every year, as the newness wears off the machines and people come to recognize them as ordinary vehicles entitled to ordinary treatment.

Out in the blue waters of the country ocean, where automobiles are rare, the inns hail them as benefactors, as their drawing power is equal to a small circus. The inhabitants come in crowds, and the stimulation of their cerebral activities caused by examination of the machine and consideration of its qualities develops thirst which the alert landlord coins into good, hard money.

One can always tell when he is in a new district by the actions of the horses. If he sees a horse standing on his hind legs, biting the atmosphere and making wigwag signals with his forefeet, he can be sure that that horse is not sophisticated. There's only one thing to do if the tourist has a companion, he must stop the car, jump out and seize the horse by the head. If he waits for the farmer to wake up the horse will climb a tree or fly over the fence.

Mr. Vanderbilt and Mr. Macdonald on the Point of Starting in a Race

All horses not well acquainted with automobiles think them uncanny, and, under the influence of superstition, will do desperate things. If formally introduced to a quiet machine and allowed to smell and examine it at their leisure horses soon grow tolerant and finally *blasé*, tho I don't know why the smell of gasoline should be reassuring.

One very good touring route is from New York along the Boston Post Road, which runs for a long distance beside the Sound, and then through New Haven to Springfield and Boston. From there you can go to Marblehead, Portsmouth, etc., and on through Crawford Notch to the White Mountains.

The scenery is varied and glorious, the roads are of the best, while the wayside inns are good and comfortable.

This is the route of the tour of the American Automobile Association for the Glidden Touring Trophy. Contestants will probably start about July 11th, visiting Mount Washington Hotel and being present at the Mount Washington hill climbing events, which will be held this year about the same days as the events last year, when some of the cars made the eight-mile climb up the average grade of 18 per cent. in less than twenty-six minutes.

This White Mountain district is most picturesque and offers excellent chances

Ross Steamer with a Mile Record of Thirty-eight Seconds

1 A Couple of Touring Cars Going Down a Gentle Hill

for adventure. Some of the hills are steep, but not dangerous. There are difficulties enough, however, to lend spice to the trip.

In returning from this locality one may come through Franconian Notch and down the charming Connecticut Valley, or through Concord, Nashua and Worcester, Mass., back to the line of the Boston Post Road again.

Following west through Springfield to Pittsfield, Mass., one arrives on the most beautiful point of the Berkshire Hills, a region of fine landscapes, well appointed houses and very good roads. A short run can be taken through Lenox, Stockbridge and Great Barrington down to Poughkeepsie, after which one can follow the lovely Hudson River Valley back to New York.

This is one of the best tours for a good time, fine accommodation and pure enjoyment.

If one desires something more ambitious or wishes to go west he can run across the State of New York by the New York Central route, through Al-

bany, Utica, Syracuse, along the lake shore even as far as Cleveland, Toledo or Chicago.

Another very alluring route passes through the Catskill Mountains, proceeding directly west from Kingston by the Grand Hotel to Binghamton, and from there going through a fine agricultural country in the western part of New York State, and joining as a finality the northern or the New York Central road at Batavia.

Long Island, of course, as every one knows, is the best locality for a few days' touring. One can skim the south shore going and the north shore coming back, with beautiful scenery, good roads and satisfactory hotels everywhere.

New Jersey also has many attractions to offer. Tourists from New York go out to New Brunswick and there take the famous Rumsen road to the shore and along to Point Pleasant, Lakewood and even as far as Atlantic City. Many tourists reach this locality by coming from Philadelphia over White Horse Pike.

The National Highway, built after the defeat of Braddock, which leads west through Hagerstown and Cumberland to Wheeling on the Ohio River, is also very attractive as well as historic.

Over this road, first built by the British and the Colonists, flowed the great stream of settlers 160 years ago. English, Irish, Scotch and Americans with their families crossed the Allegheny Mountains by means of this highway and pre-empted the lands beyond, into which the French were then moving. Relics of those old days are common along the route. The old inns still stand there with their immense chimneys and fireplaces, almost big enough to take a cord of wood at a time. Old milestones and sundials speak eloquently of the past.

Going west from Wheeling one crosses the foothills and emerges on the plains, where the farming country is unsurpassed. The road here was built through the States of Ohio and Indiana by money obtained from the sale of public lands

as provided for when they received their charters as States, 5 per cent. being set aside for this purpose.

The road down the Shenandoah Valley is well known to bicyclists, but less explored by the automobilist. In the early spring or late fall the blossoms on the trees or the turning leaves make scenes of rare beauty all the way from Winchester and Lexington as far as Natural Bridge. Like all the Southern roads, one here finds this was constructed after the old method—the builders laid the stones and waited for travel to beat them in and make the bed smooth. Some of these roads have very solid foundations, they have at intervals what are called “water breakers” or “bars,” known in the North as “thank-you-ma’ams,” which are very annoying and liable to break your springs if taken too fast.

If one can overcome the difficulties of the Southern highways he can find many attractive places in the South. Ormond Beach, Florida, is a bit of paradise for

Hill Climbing

the autoist. During last winter the fastest mile ever made by a vehicle going under its own power was made there by H. W. Bowden, of Boston, with a machine which he runs by joining two 60 horse-power Mercedes motors. He went the mile in 32 2-5 seconds, but was not allowed a record as his machine was overweight.

Florida likewise offers attractions for the winter tourist and he will do well also to cross to Cuba with his machine. In Cuba he will find glorious roads, hard white and smooth running through avenues of palms. France itself would be hard put to it to surpass the excellence of some Cuban roads, which are a legacy from the departed Spaniards.

As to the question of what machine is best for the tourist the answer to that must be that it depends on the tourist. Different tourists have different wants.

For luxury and speed it is almost everywhere admitted that the foreign built machines are the best at the present time, as well as the highest priced. Among American machines are models well adapted for touring, and perhaps that give the buyer more for his money than he gets elsewhere. As far as reliability goes there are American machines that I think will stand all tests as well as any. For traveling over a rough road the White steam car, for instance, ranks very high. Electric cars are more suited to the city and immediate suburbs.

Some high powered gasoline cars are well calculated for touring, and are comfortable with four or five in the party, but I strongly advise against overloading any car and warn the tourist to be quite sure that he has a place for everything and all the articles he requires, otherwise there will be great discomfort.

The pleasure of a party is much enhanced if they can dispense with a chauffeur. It is well to provide warm and waterproof clothing and chains for the wheels, to prevent skidding. Extra tires must be carried, of course, and two jacks are better than one, because when you have the machine raised on one jack you can slip the other under and raise it still more. The bravest tourists can dispense with canopied tops, altho if the road's smooth and ladies are in the party they are of great convenience.

Another thing needed is a camera, for one sees plenty that he desires to preserve, and he should also have as a chart a route-card, showing the towns through which he will go, their distance from each other and from the starting point. He should if possible also report the tour to some organization or periodical.

The Touring Committee of the American Automobile Association have a great deal of information to impart to the tourists. They contemplate issuing maps for the benefit of their members and friends, and are glad to assist them. Motorists will find that by consulting the committee they will be able to make the tour without much difficulty.

Accidents will happen, of course, but they need not be a source of displeasure. A person can have a great deal of enjoyment repairing a machine, provided it is well made and he successfully overcomes the difficulty. There is much pleasure in getting it just right. An accident should not be dreaded, but accepted as part of the tour. There is a deeper pleasure, a more lasting sense of gratification, at accomplishing some difficult undertaking, even tho it entails some hard work. After it is all over one is glad to look back and to go over again the experience and feel that part of life had been lost if the event had been omitted.

The motorist should remember always to slow up when coming to a crossroad. No one can tell what's around the corner. The greatest danger is from other cars, which at times certainly do come whizzing by.

Some idea of the way in which the sport of automobiling is progressing in this country may be gained from the figures of the manufacturers. There are now about 17,000 licenses issued in New York State alone, and something like 75,000 have been made in this country. Last year 25,000 machines were made and this year 30,000 are being made.

I will make one last suggestion: When out in the country always check information received by questioning the next man you meet. Ask him as to the road you are on and how far it is to the town you are making for; distances are especially deceptive.

Don't be afraid of asking three or four people the same question and check-

ing one by the other, for in the rural regions the wits think it prime fun to misdirect, and if you neglect precautions you may find yourself, when the shades of night are falling, sitting humped up in your machine fifty miles from anywhere, not knowing which way to go

and using language not to be found in any of the sacred writings, while your soul writhes at the bitter thought that far, far away on his humble cot a pie-faced rustic is gloating over his own cleverness in "taking a rise out of that there city feller."

NEW YORK, May 3, 1905.

## The Pleasures of Ballooning

BY A. SANTOS-DUMONT

[The interest taken all over the world in ballooning as a sport is largely due to M. Santos-Dumont's daring and successful experiments in the management of motor dirigible balloons. The following article is copyrighted in Great Britain and other countries signatory to the Berne Convention, and all rights are reserved.—EDITOR.]

I SHALL never forget the unalloyed pleasures of my first balloon ascension. Tho scarcely more than a youth, I had long dreamed of the adventure, because in those days, before the founding of the Aero Club, it *was* an adventure, even in Paris. Everything was still in the hands of the professional aeronauts; and it was with one of the kindest and best of these, the late M. Machuron, that I was to make my initiation. To-day even ladies of Paris society, like the young Duchesse d'Uzes, think nothing of starting off from the Parc de Saint-Cloud for an afternoon floating over the map of France.

It was a beautiful morning in late spring. The basket rocked coquettishly beneath the immense sphere. I stood in my corner and heard the last word given: "Let go all!"

The wind ceased. All seemed instantly motionless around us. We were

off, without feeling it, at the speed of the air current in which we must live and move and have all our sensations, without having any sensation of its existence! Infinitely gentle is the unfelt movement upward and onward; the illusion is complete; it seems to be not we who move, but the earth itself that is sinking down and away from us!

In the emptiness that had already opened 1,500 yards below us, almost before I could realize it, the earth looked no longer the same. No, it did *not* look like an orange flattened at the Poles—we were not far enough away for *that*; but, by a phenomenon of refraction it showed concave like a bowl, the effect being to lift up constantly to the aeronaut's eye the circle of the horizon.

Villages and woods, chateaux and gardens slip and glide far, far below. Faint piercing sounds,

M. Santos-Dumont in the Car of His Airship

like locomotive whistles and the yelping of stray dogs, are the only ones which penetrate to us. The human voice cannot mount up to these solitudes. Human beings look like ants along white lines that are highways.

While my gaze was still held fascinated a cloud masked the sun. It cooled the gas of our balloon, which obviously wrinkled and began descending, gently at first and then with accelerated speed, against which we struggled by throwing out ballast. Yes, I was frightened. I did not *feel* myself falling, but I could *see* the earth coming swiftly up to us; and I knew what that meant!

It was an idle emotion. A few pounds of ballast overboard not only stopped the mad career of the earth in our direction, but sent it down, down, down again away from us, and we found our equilibrium, this time above a plateau of clouds at about 3,000 yards. It was a wonderful sight. On the dazzling white cloud screen below us the sun cast shadows of the balloon and ourselves, magnified to giant size; and this in the exact center of a magnificent rainbow.

As we could no longer see the earth by reason of this cloud screen, all sight sensation, even of movement, ceased. Were we standing still? Were we traveling at storm speed? We knew nothing. To learn the direction we were taking we had to drop below the clouds.

At the moment we began to see the earth again a gay peal of bells mounted up to us. It was the noon Angelus from some village belfry. I had brought up a little *panier* of hard boiled eggs, cold meats, cheese, ice cream, fruits, cakes, champagne, coffee and liquors, and I now experienced how delightful it is to lunch above the clouds in the *nacelle* of a spherical balloon.

No earthly dining room could possibly have such a decoration. The sun's heat sets the clouds in ebullition, making them throw up rainbow jets of frozen vapor like fireworks all around the table. Lace-like spangles of the most delicate ice formation scatter themselves here and there, appearing out of nothing, and film-like flakes pop into existence under our very eyes, in our very drinking glasses.

Then, suddenly, all changed like the trick in the pantomime; and a somber drop scene fell on the fairy scene of sunlight, cloud billows and azure. The barometer rose rapidly 5 millimeters, showing a sudden rupture of equilibrium and a swift descent. Doubtless the balloon had become overweighed with some pounds of snow, and it was certainly falling into a cloud.

We passed into the dim darkness of the fog. We still saw our basket, instruments and the parts of the rigging nearest us; but the balloon had completely disappeared. So we had the strange and delightful sensation of hanging in the void without support, either above or below; of having lost our weight; of being nowhere! Really, it was strange beyond description.

We slackened the fall, as usual, by throwing out ballast, and came to equilibrium far, far below the clouds at scarcely more than 300 yards altitude. A village fled beneath us. We were scudding fast. We compared our route map with the immense natural map unfolding below us, and soon we could identify roads, railways, villages and forests—all hurrying toward us from the horizon with the swiftness of the wind itself.

The storm which had sent us down marked a change in the weather. Little gusts pushed the balloon from one side to the other and up and down. Again, and again the guide rope, dangling 100 yards below our basket, touched earth; and soon even the basket began to graze the tops of trees.

What is called "guide roping" thus began for me. M. Machuron and I each held a sack of ballast, and when some special obstacle rose in our path—a tree or house—one of us would throw out a few handfuls of sand, to make the balloon leap up and pass over it. More than half the guide rope dragged behind us, and so we scudded comparatively close to earth at a wonderfully even altitude.

But shortly, as we passed over a little group of trees, a shock threw us backward into the basket. The balloon had stopped short and was swaying in the gusts at the end of its guide rope, which had curled itself around the head of an oak. For fifteen minutes it kept us shak-

ing tremendously, and it was only by throwing out a quantity of ballast that we were able to get ourselves loose. The lightened balloon immediately made a terrifying leap upward, piercing some low clouds like a cannon ball.

That was a sensation. We were still shooting up, up; and it was time to have recourse to effective means, to open the maneuver valve and let out a portion of our gas. It was done in a moment. The

the violence of the wind, and we cast anchor, at the same time opening wide the emergency valve for the wholesale escape of the gas. And so we landed—plump!—without dragging, and stood watching the balloon die. It was almost a pitiful sight. Sprawling in the field, it was losing the remains of its gas in convulsive movements, like a great bird that dies beating its wings. Then we packed the silk envelope, anchor, rope and uten-

Photograph of Inflated Balloons Ready for the Ascent in the Aeronautical Park, Paris, Taken from a Balloon 200 Meters Above

balloon began descending again, until its guide rope again dragged on the ground. There was nothing but to bring the trip to an end, because only a little sand remained in the ballast bags.

I watched my captain's maneuvers. He who would navigate an airship should first practice landing in a spherical balloon, take my word for it. The wind being strong enough, it was necessary to seek shelter for this last crowning act of air-captainship. A corner of the forest of Fontainebleau was coming toward us. We turned the extremity of the wood, sacrificing our last ounce of ballast. Here the trees protected us from

sils in the basket and hired a man to haul it to the nearest railway station.

After two more such personally conducted trips, in which I sought to do all the maneuvering with my own hands under M. Machuron's kind instruction, I ventured in a spherical balloon, and during this early period I made very many trips, landing in all parts of France. Often they were prolonged into the night; and no sporting sensations are more diversified and agreeable than those of night ballooning. One is alone in the black void—yes, in a murky limbo; but one seems to float there without weight, without dimensions, without a surround-

ing world—a soul freed from the trammels of matter!

Now and again there come the lights of earth to cheer you. You see a point far below ahead. It slowly expands, until where there came to be a blaze there are countless bright spots. They run in lines, with here and there a cluster. It is a city.

Then it is out again over the lone land. When the moon rises you see, perhaps, a faint curling line of gray. It is a river, with moonlight or starlight falling on its waters. There comes a flash and a faint roar; it is a railway train, the locomotive's fires illuminating for a moment its smoke as it rises. Then you throw out ballast and rise through the dank black clouds to a soul-lifting burst of starlight. And there, alone with the constellations, you await the dawn.

When the dawn comes, red and gold and purple, one is almost loath to seek the cheery, busy earth again, altho the novelty of landing in who knows what part of Europe affords still another unique pleasure. For many the greatest charm of spherical ballooning lies here. The spherical balloonist becomes an explorer. Are you young? Would you roam and tempt adventures? And are you tied down? You may still penetrate the unknown and deal with the unexpected. Take to spherical ballooning, as do the youth and beauty of the Paris Aero Club. At noon you lunch peacefully with your family. At 2 p.m. you dart into the air; ten minutes later you are no longer a commonplace, law-abiding citizen. You are an explorer in unknown seas of light!

You know but vaguely where you are, and you do *not* know where you are going to bring up. Something depends on your skill and experience. The choice of altitude and air currents is yours, but when the moment comes to land you have the true explorer's zest of coming on unknown peoples, who are not expecting you—a god from a machine!

"What country is this?" Will the answer come in French, German, Italian, Norwegian, or even Russian? Paris Aero Club members have actually been shot at crossing European frontiers.

Yes, the air is still for most people an unknown element; and I who know

it remain astonished at the world of different sensations one experiences in it as one goes as a spherical or dirigible balloonist. The realization of this wonderful difference flashed on me, at a moment I recall well, as I was steering a straight, swift course along the Mediterranean coast in my No. 6 during the memorable winter of 1902.

I was by this time an experienced dirigible balloon captain—it was the winter following my winning of the Deutsch Prize in Paris; I had no task to perform, nothing to prove, and I could give myself up to the pleasures of aerial navigation in by far the swiftest airship I had yet constructed. As I steered my course I remember saying to myself:

"How different are these from the sensations of the spherical balloonist! It is true that he has the earth flying backward beneath him at a great speed, but he knows that he is powerless. The sphere of gas above him is the plaything of the air current in which it finds itself; and he cannot change its direction."

In my dirigible balloon I could see myself flying over the sea, and I had my hand on a helm that made me master of my direction in the splendid course I was making. Once or twice, to test the power, without other motive, I shoved the helm around, while going at full speed. Delightfully obedient, the airship's helm swung to the other side, and I was speeding in a new diagonal course that would have brought me to shore in a few minutes had I continued it. But these maneuvers only occupied a few instants each, and each time I swung myself back on a straight line to the entrance of the Bay of Monaco, from which I had come and to which I must return to the balloon house built for me by the Prince of that bay and the land around it, for I was flying homeward like an eagle.

To those watching my return, from the terraces of Monte Carlo and Monaco town (as they told me afterward), the airship increased in size at each moment, like a veritable eagle bearing down on them. As the wind was coming toward them they could hear the low crackling buzz of my motor a long distance away. Faintly now their own shouts of encouragement came to me. They grew

louder. Around the bay a thousand handkerchiefs were fluttering. I gave a sharp turn to the helm, and the airship leapt into the bay, to slow down and be caught and conducted to its "stable."

Here in these azure solitudes there were no chimney pots of Paris, no cruelly threatening roof corners. I had plenty of leisure to look about me and enjoy my position. One of my impressions was that I was still isolated in spite of my ability to direct the airship's course. I remember once meeting two beautiful sailing yachts scudding toward me down the coast. Their sails were full bellied. As I darted over them and they beneath me, I heard a faint cheer, and a graceful feminine figure on the foremost yacht waved a red foulard. As I turned to answer the politeness I perceived that we were already far, far apart.

I was now well up the coast, about half way between Monaco and Cape Saint-Martin. Above was the limitless blue void; below was the solitude of the white-capped waves, and a sudden squall was coming up. Well, I had the fierce pleasure of depending on myself, with every sense alert, and a growing curiosity to learn the power of my motor and propeller to get me out of the scrape. I had never turned in a storm.

Porting my helm, I held the rudder tight. The dirigible swung around like a boat, and as the wind now aided to send me flying down the coast my only work was to maintain my steady course and enjoy the reflections I have already described.

Pleasures like these—the triumphs of personal effort from minute to minute—the spherical balloonist may not know. I recall a similar moment of fierce enjoyment on my return from the Eiffel Tower, when I won the Deutsch Prize for aerial navigation in October, 1901. On my way to the Tower the motor had worked fairly well. Now, after I had left it some 500 yards behind me, it was actually on the point of stopping. I had an instant of great uncertainty. I must make a quick decision. It was to abandon the steering wheel for a moment, at the risk of being torn from my course, in order to give my attention to the carburating lever and the lever controlling the electric spark.

The motor began to work again. I had almost reached the Bois de Boulogne, where, by a phenomenon known to all aeronauts, the cool air from the trees began making the balloon heavier and heavier—*i.e.*, smaller by condensation—when, by an unlucky coincidence, the motor began slowing again. Thus the airship was descending while its motive force was decreasing. I had instantly to throw back both guide rope and shifting weights, changing my center of gravity considerably. This caused the balloon to point diagonally upward, so that the remaining propeller force caused me to remount continually into the air by jerks, so to speak.

I was directly over the crowd of the Auteuil Racetrack. I heard the applause of the mighty throng, when suddenly my capricious motor started working like a *beau diable*. The suddenly accelerated propeller being almost under the up-pointing airship caused an exaggeration of the inclination, so that the applause of the crowd changed to cries of alarm as I darted for a moment almost vertically upward. As for myself I had no fear, knowing the circumstances and feeling doubly safe over the trees of the Bois de Boulogne, whose soft greenery always reassured me, in spite of its having played me many a trick in my earlier experiments. I might have checked the sensational upward shoot by simply slowing the motor that was causing it; but I was doing a race that I actually did win, so I went on, soon righting myself by shifting guide rope and weights forward again. All the same, this is why I passed so high over the judges' heads that my guide rope could not be caught—a detail that caused some hair-splitting at the time, as may be remembered.

If I were asked what were my very first sensations of aerial navigation, I would have to confess surprise to feel the airship going straight ahead. It was astonishing to feel the wind in my face. As a spherical balloonist I had always gone *in* the wind, becoming part of it and not feeling it. As my airship plowed ahead the wind fluttered my coat violently, as on the deck of an Atlantic liner, tho in all other respects it is more like river navigation with a steamboat. It is not at all like sail navigation

and all talk about "tacking" is meaningless. Imagine the air current to be a river running 10 miles per hour. If you go against the current, making 20 miles per hour, your net progress will be but 10 miles per hour. If your propeller makes you 20 miles per hour *with* the current, your net speed becomes 30 miles per hour. Well, it is just so in an airship. In a calm it makes its own speed, unaffected by wind current.

The navigator of the air, however, has one great pleasure unknown to the navigator of a river. He can seek to change one air current for another. The air is full of varying currents. Mounting, I have often sought and found either a calm or an advantageous breeze, even in a spherical balloon; and this is one of the ever-changing delights of the aerial realm.

Before going on my first airship experiment I really wondered if I should be seasick. I imagined that the sensation of mounting and descending *obliquely* (with my shifting weights) might prove queerish, and I looked forward to a deal of pitching—not rolling—another novelty in ballooning. For, remember always, the spherical balloon gives no sensation of movement at all.

In my first airship, however, the suspension was so long that it approximated

that of a spherical balloon. For this reason there was very little pitching. And speaking generally, since that time, tho I have been told that on this or that trip I pitched considerably, I have never been seasick in the air.

You see in the airship there is no smell. All is pure and clean, and the pitching itself has none of those shocks and hesitations of the boat at sea. The movement is suave and flowing, owing to the immensely lesser resistance of the air. The pitches are less rapid than at sea; the dip is not brusquely arrested—so the mind can anticipate the curve to its very end and be prepared. There is no shock to give that "empty" feeling as the giant transatlantic construction rises out of the water, first its fore part, then its aft, with its propeller churning the air so viciously, to sink the next moment and churn the water.

All this brings me to the most remarkable of all the sensations of aerial navigation. This is the wonderful diagonal flight. On my first trip it actually shocked me. Man has never known anything like free vertical existence. Held to the plane of the earth, his movement "down" has scarcely been more than a return after a short excursion "up," our minds always remaining on the plane surface, even while our bodies may be

Returning to the Bay of Monaco, "Flying Homeward Like an Eagle." (Page 1228.)

mounting, and this is so much true that the spherical balloonist as he rises has no sense of movement, but gains the impression on which I have insisted, that the earth is descending below him. With respect to combinations of vertical and horizontal movement man is quite without experience. Indeed, I cannot describe the delight, the wonder and intoxication of that free diagonal movement onward and upward, or onward and downward, combined at will with changes of direction horizontally when the airship answers to the touch of the rudder! The birds have this sensation when they spread their wings and go tobogganning in curves and spirals through the sky.

Of course, when I look back, it is not always easy for me to separate the pleasures of successful effort, the satisfactions of *amour propre*, and the anticipations of triumphs to come from the natural and innate pleasures of dirigible ballooning. The time, nevertheless, came when I tired of the former and leaned toward the latter, and I made this comparison: Once I was enamoured of high power petroleum automobiles—they can go at wonderful speed to any part of Europe, finding their fuel in any village. But when I discovered that I did not want to go to Moskow or to Lisbon, the small and handy electric runabout in which I do my errands about Paris proved more satisfactory.

From the standpoint of my pleasure and convenience as a Parisian, my experience has been similar. Because, you understand, I do this for my pleasure; I have no mission to labor and risk my life merely to demonstrate things to the public. So I built my little "No. 9 runabout," the smallest of possible dirigibles, which I am, in one sense, copying again on a larger scale this summer. Indeed, it was so small that its original motor was a 3 horse-power Clement, weighing 26 pounds, while its ballast capacity was only 66 pounds. Yet with it I went careering over the Bois at as much as 15 miles per hour, notwithstanding its egg-shaped form, which was seemingly little calculated for cutting the air. The balloon of my airship for this summer will be much more cigar-shaped, slender and pointed, because I have hit

on a new stiffening device and no longer fear doubling up like a jack-knife.

How practical this little "runabout" proved itself was shown when I landed with it the first time in the grounds of the Aero Club at Saint-Cloud, in the midst of nine fully inflated spherical balloons, there held ready to be let off on a ladies' race. After a short call, I prepared to start away again to my own balloon house at Neuilly, Saint-James.

"Can we give you some gas?" politely asked my fellow clubmen.

"You saw me coming all the way from Neuilly," I replied; "did I appear to be throwing any ballast?"

"You threw no ballast," they admitted, and it was obvious I could only have started with some 66 pounds of it.

"Then why should I be in need of gas?" I asked. As a matter of curiosity I may relate that I did not lose or sacrifice a cubic foot of gas or a single kilogramme of ballast that whole afternoon.

After leaving my friends at Saint-Cloud I made a typically peaceful "Parisian" air trip—because you must not imagine that the pleasures of dirigible ballooning have all to do with fierce and palpitating effort in blue solitudes. No, there is also the aerial park saunter, absolutely devoid of risk and danger.

To go from Neuilly, Saint-James, to the Aero Club's park I had already passed the Seine. Now, crossing it again I made for the *café* restaurant of the "Cascade," where I descended for refreshment and a chat. It was 5 p.m. Not yet wishing to quit the amusing little voyage, I left the sylvan *café*, crossed the river for a third time, and went straight as close to Mont Valérien as delicacy permitted. (It is an important fort, defending Paris and guarding its own secrets jealously.) Then returning I crossed the river for a last time and came to earth in my own grounds at Neuilly. During my whole trip my highest altitude was 346 feet. Taking into consideration that my guide rope hangs 130 feet below me and that the tops of the Bois trees extend up some 70 feet from the ground, I had enjoyed but 140 feet of clear space for vertical maneuvering.

It was enough, and the proof is that I have amused myself guide roping

round the Arc de Triomphe and down the Avenue des Champs Elysées at as low an altitude as the housetops on either side, fearing no ill and finding no difficulty.

Knowing that the feat must be accomplished at an hour when the pleasure promenade of all Paris would be the least encumbered, I had instructed my men to sleep through the early part of the night at the Neuilly station. Arriving at 3 a.m. I climbed the wall, soothed the dog, waked the men, brought out the airship and crossed the Seine as I rose diagonally a little after dawn. Turning to the left I made my way over the Bois, picking out the open spaces. When I came to trees I jumped over them. So, navigating through the cool air of dawn I reached the Porte Dauphine and the beginning of the Avenue of the Bois, which leads to the Arc de Triomphe.

The carriage promenade of Tout Paris was empty, and I might actually have threaded the Arc de Triomphe had I deemed myself worthy. Instead, I rounded the national monument to the right, as the law directs. Like the Avenue of the Bois, the Avenue of the Champs Elysées, was deserted. Far down its length I saw a solitary cab. As I guide roped along to my house at the corner of the rue Washington, I thought of the time, sure to come, when the navigators of handy little airships will not be obliged to land in the street, but will have their guide ropes caught by their domestics on their own roof-gardens.

So I reached my street corner, to which I pointed downward my stem and descended very gently. Two servants caught, steadied and held the airship while I mounted to my apartment for a cup of coffee. That is another kind of dirigible ballooning!

PARIS, FRANCE.

## A Ballade of Dead Cities

BY JESSIE STORRS FERRIS

WHERE are their purpled pomp and pride,  
And where their caliphs and their kings?  
The martial Cæsars, have they died?  
The jeweled rajahs, flown on wings?  
The walls that knew beleaguerings,  
The moats that ran with blood alway—  
Where are they,—boast of man-made things?—  
Dead, driven, desert dust are they.

Oh, where is Thebes, that by the tide  
Of Nilus saw strange worshipings?  
And Carthage, where gold galleys plied?  
And Troy, whose wars the Poet sings?  
Pompeii, where is she whose strings  
Of pleasure snapt too soon,—that lay  
Prone 'neath Vesuvius' scoriac stings?—  
Dead, driven, desert dust are they.

And where is Babylon, that sighed  
'Mid gardens cooled with fountain-springs?  
And Tyre, all royal-ruddy dyed?  
And Sidon, rich from voyagings?  
Where now is Sparta,—name that rings  
The clarion-call of courage?—Nay,  
Your word no answering echo brings,—  
Dead, driven, desert dust are they.

ENVOY.

Prince, 'mid your June-tide junketings,  
Know that man's life is but a day,  
And vain his lordliest fashionings,—  
Dead, driven, desert dust are they.

BUFFALO, N. Y.

## Matwock of the Icebergs

BY WILLIAM J. LONG

AUTHOR OF "SECRETS OF THE WOODS," "A LITTLE BROTHER TO THE BEAR," ETC.

**M**ATWOCK, the huge polar bear, drifted down from the Arctic on an iceberg and landed, one spring night, in the fog, at Little Harbor Home on the east Newfoundland coast.

It seemed at first a colossal fatality, that iceberg. The fishermen had just brought their families back from the winter lodge in the woods, and had made their boats ready to go out to the Hook-and-line grounds for a few fresh cod to keep themselves alive. Then a heavy fog shut in, and in the midst of the fog the iceberg came blundering into the tickle, as if there were no other place in a thousand leagues of sea and rock-bound coast. There were two hundred fathoms of water at the harbor mouth

and the great berg touched bottom softly, yet with a terrific impact which sent huge masses of ice crashing down on the black rocks on either side. It might stay a month, or it might drift away on the next tide. Meanwhile the fishermen were helpless as flies in a bottle, for the iceberg corked the harbor mouth, and not even a punt could get out or in.

Old Tomah, the Indian, came that same day from his hunting camp far away in the interior. Grown tired of beaver meat and willow bark, he had brought some otter skins to trade for a little pork and tobacco, with a few warm stockings thrown in for good measure. But the trading schooner, for which the islanders watch in spring as a lost man watches

for morning, had not yet come, and the fishermen were themselves at the point of starvation. For a month they had tasted nothing but a little dried fish and doughballs. Hunting was out of the question, for their dogs were all dead and their few guns were out with the young men, who, before the advent of the iceberg, had taken their lives in their hands and gone up the coast sealing in a stout little schooner. So Tomah, taking his otter skins, started back for his own camp.

As his custom was in a strange place, Tomah first climbed the highest hill in the neighborhood to get his bearings. The blundering iceberg seemed to him a grim joke, more grim than the joke on himself which had left him after a forty-mile tramp without pork or tobacco or warm stockings. He was watching the berg with silent, Indian intentness when a mass of overhanging ice crashed down on the rocks. Something stirred in a deep cave suddenly laid open; the next instant his keen eyes made out the figure of a huge white bear standing in the cave, rocking his head up and down as the smell of the village drifted out of the harbor into his hungry nostrils.

Tomah came down from the hill to leave a warning at the little store. "Bes' look out," he said. "Bear over dere on dat hice; big, oh, big one! He come here to-night, soon's dark, see w'at he kin find. He hungry, an' oh, cross! don't 'fraid noting. Bes' set um trap, ketch um plenty meat." Then, because he had left his own gun behind and could borrow none in the village, he started inland on his long tramp.

Matwock the bear landed from his iceberg as soon as it was dark, as Tomah had said, and headed straight for the village. For a month he had been adrift in the open sea without food, because the seals, which had first enticed him away till fifty miles of open water stretched between him and his native haunts, had now returned to the coast to rear their young on the rocks and grounded ice floes. Meanwhile the great berg, to which he clung as a mariner to a floating spar, drifted steadily southward over the mist-shrouded ocean, with its foot a thousand feet deep in a powerful current. Most of the time he had slept, going back to the old bear habit

of hibernation to save his strength; but when the berg grounded and the wind from the harbor brought the smell of fish and of living animals to his nose he sprang up ravenously hungry. Never having seen men, he had no fear. Straight and swift he followed his nose, ready to seize the first food, living or dead, that lay in his path.

On the outskirts of the village he came upon a huge deadfall which the men had made hurriedly at Tomah's suggestion, partly to get meat, of which they were in sore need, but more to protect themselves and their little ones from the savage prowler which knew no fear. The bait was a lot of offal, bones and fish skins tied together with cod line, and the fall-log was the stump of a big mast, waterlogged and heavy as lead, which had come ashore years ago from a wreck and which they made heavier still by rocks lashed on with cables. Matwock entered the pen swiftly, grabbed the bait, and, *thud!* down came the weighted log on his shoulders.

Now a black bear would have been caught across the small of the back and his spine cracked like an eggshell by the fearful blow. But Matwock was altogether too big, and the pen altogether too small. With a roar of rage he hurled the log aside, smashed the pen into fragments, and charged straight through the village, knocking to pieces with blows of his terrible paws the pens and fishflakes that stood across his path.

Matwock went back to his cave in the iceberg, angry and sore, yet with a strange timidity at heart from this first experience in the abodes of men. What the beastly thing was that had fallen on his back he had, of course, no idea, but he had learned in a minute that he could not prowl here with the power and authority that marked him in the vast snowy solitudes where no man dwells. He was licking a wound that a chain had torn in his shaggy white coat when a faint scratching and grunting, amid the ceaseless roar of breakers and booming of waves in the ice caverns, came to his sensitive ears and made him steal out instantly to investigate.

Down on a shelf of ice, on the seaward side of the great berg, two bull seals had floundered out, fat and heavy with food, to sleep and bask a while in the sun,

which was just then rising. A glance told the bear that the big seals had chosen the spot well, where no danger could approach save from the open sea out of which they had just come. Of the berg itself they had no fear whatever, for it rose behind them a hundred feet in a sharp incline to where a score of glistening spires and minarets began, on which the sea birds were nesting. So they stretched their fat bulks comfortably on the narrow shelf of ice, watching the open sea, blinking sleepily in the sunshine.

Slowly, cautiously Matwock circled the berg, creeping upward along a great crevice to reach another shelf over the basking seals. His great feet were padded thickly with fur, which clung to the ice like wool, and where the ascent was most ticklish the muscles of his forelegs contracted strongly, driving his claws like steel hooks into the ice. So he gained the high shelf at last and lay down with only his ears and eyes showing over the edge as he looked down hungrily at his game.

Below him was a dizzy incline, steep as a mountain top, polished and glistening with the frost and storms of the centuries, at the foot of which the unconscious seals were basking. Very deliberately Matwock chose his position over the larger seal; then with his hind legs he pushed himself steadily over the edge, crouching low on his belly, with his nose on his forepaws, which were stretched straight out in front of him. Like a flash of light he glanced down over the slope, striking the seal a terrific blow and knocking him end over end as the bear shot over him into the sea. There was a terrible commotion for an instant, which set the sea birds flapping and clamoring wildly; then out of the turmoil Matwock's head arose, gripping the big seal by the neck. He laid his game carefully on the ice shelf, kicked himself up after it and ate it there, where a moment before it had been blinking sleepily in the morning sun.

The presence of his favorite game in the strange land turned Matwock's thoughts from the village of men into which he had blundered with the ice-berg. No boats came out or in to disturb him, so he kept his abode in the ice cavern, which was safe and warm, and out

of which he wandered daily up and down the rocky coast.

A few mother seals had their young here hidden on the great ice floes, which were fast anchored to the rocks and shoals. The little seals are snow white at first—for kind Nature forgets none of her helpless children—the better to hide on the white ice on which they are born. Only their eyes and the tips of their noses are black, and at the first alarm they close their eyes and lie very still, so that it is almost impossible to see them. Even when you stand over them they look like rough lumps of snow-ice. If they have time they even hide the black tips of their noses in their white fur coats, and if you appear suddenly they simply close their eyes, and the black nose tip looks like a stray pebble or a tiny bit of bark left by the uneasy winds that sweep over the ice floes. As they grow larger and begin to fish for themselves they gradually turn dark and sleek, like their mothers, the better to slip unseen through the dark waters in which they hunt.

Like all bears Matwock has poor eyes and depends chiefly on his nose in scouting. He would swim swiftly, mile after mile, along the edges of the floes, raising his head to sniff every breeze, trying to locate where the young seals were hiding. But the little ones give out almost no scent at such times, besides being invisible, and Matwock rarely dined on a nest of young seals. The only way he could catch them was by a cunning bit of bear strategy. He would swim far out from the edge of the floes and drift about among the floating ice, looking himself like an ice cake; or else he would crouch on an ice field and watch for hours till he saw a big seal clamber out and knew from her actions that she was feeding her young. Then he would head straight and swift for the spot and nose all over it till he found what he was seeking.

When the big bull seals came ashore to bask in the sun, resting on a rock or the edge of an ice floe, whence they could slip instantly into deep water, Matwock adopted slyly a different style of hunting. He would slip silently far down to leeward—for the seal's nose is almost as keen as his own—and there begin his cautious stalk up-wind. Sinking his

enormous weight deep in the water till only his nose and the top of his head appeared, he would glide slowly along the edge of the floe, looking exactly like a bit of loose ice drifting along in the tide. When near the game he would disappear entirely, and, like an otter, not a ripple marked the spot where he went down.

The big seal would be blinking sleepily on the edge of the ice floe, raising himself on his flippers to stretch like a wolf, or turning uneasily to warm both sides at the sun, when the huge head and shoulders of a bear would shoot up out of the water directly in front of him. One swift, crushing blow of the terrible paw and the seal would be dead without a thought of what had happened to him.

So Matwock lived and hunted for a week, growing fat and contented again. Then the seals vanished on one of their sudden migrations—following the fish, no doubt—and for a week more he hunted without a mouthful. One night, when he returned late to his cave, the great iceberg had broken its anchorage and drifted well out of the tickle, and from the harbor the smell of fresh fish drifted into his hungry nostrils. For the day had been sunny and calm, and the starving fishermen had slipped out to the Hook-and-line grounds and brought back exultingly the first cod of the season.

Again Matwock came ashore, tired as he was after an all day's swim, and headed straight for the good smell in the village. The big deadfall was set in his path, baited with fresh offal, and the log was weighted twice as heavily as before. But the bear had learned cunning and entered the trap from the rear, tearing the heavy pen to pieces as if it were made of straws. The fall came down again with a thud that made the ground shiver, but it fell harmlessly on the bed-log, and Matwock ate the bait greedily to the last scrap. Then he entered the village, rummaging the wharves and sheds boldly, and leaving his great footprints at every door.

Late that night Old Tomah appeared with his otter skins and a haunch of caribou at Daddy Crummet's cabin, on the edge of the woods far down at the bottom of Long Arm. All winter Daddy Crummet had been sick—chiefly from

lack of food and rheumatism—and Tomah, taking pity on the lonely old man, blundered around in the dark to find wood and to make a stew of the savory meat which he had brought with him all the way from his camp in the interior. At twilight a fisherman had come to leave a couple of fresh cod and hurry away again on his long, weary pull up the Arm. Daddy meant to cook the fish, but was too weak when the time came, and left them in a barrel in his little shed. Then came Tomah with his stew, and the old man ate and felt better. It was midnight when they had smoked a pipe of Tomah's dried willow bark and traded the scant news from the two ends of the wilderness and turned in to sleep.

A terrible racket in the shed roused them—*whack! bang! thump!* Something was out there knocking everything to pieces. Daddy, under the bed-clothes, began to shiver and wail that the devil himself had come to fetch him. Tomah jumped up like a Jack-in-a-box, just as a barrel was flung against the door with a crash that made it shiver. In the appalling silence that followed they heard the *p'chap-p'chap* of some huge beast crunching the codfish between his jaws.

Tomah had brought his gun this time. He grabbed it from behind the stove, pulled the big hammer back, and felt with his fingers to be sure that the cap was ready on the nipple. He stole to the door and opened it a crack, pushing the gun barrel out ahead of him. A huge white beast turned swiftly as the door squeaked. Tomah, making out what seemed to him a great head in the darkness, poked the muzzle of the gun into it and pulled the trigger. There was a deafening roar; the door was slammed back in the face of the old Indian with a force that sent him sprawling on his back.

When Tomah scrambled to his feet, his ears ringing, his nose filled with pungent powder smoke, there lay Matwock at the end of his long trail. He was lying as if asleep, his great paws outspread across the threshold, his head resting heavily between them. The tail of the last codfish stuck out of his mouth and his lips were parted in a ferocious grin, as if to the end it were all a huge joke.

STAMFORD, CONN.

# Modern Angling

BY DWIGHT W. HUNTINGTON

AUTHOR OF "OUR BIG GAME." ILLUSTRATIONS BY THE AUTHOR

IF it be true, as recently stated by a competent authority, that upward of ten thousand books and papers have been written about fishing, it would seem that but little remained to be said. Our fishing to-day, however, is in many particulars diametrically opposite the angling familiar to the older living anglers. When we recall the many lakes and streams which we knew when they were full of fine bass and trout, and which were completely fished out, we cease to wonder at the demand of the anglers for a change which has come about. It seemed for a time that our fishing and our shooting were destined to come to a sudden ending. A few years ago we had no game laws. We now have many, some of which are past the comprehension of the average layman.

A glance at the laws indicates that the season for taking the game fishes has been much shortened in most of the Northern States, and fishing is now distinctly a summer sport. The open season for trout and bass usually begins in the late spring or early summer and ends on or before the coming of cold weather. In most of the Southern States, however, there are no fish laws and one may fish the whole year through.

In addition to shortening the season and protecting the fish during the spawning season and in winter, nearly all of the States which have fish laws limit the number of fish or pounds of fish *per diem*. In Nebraska and North Dakota, for example, the catch limit is 25 fish *per diem*. In Iowa the catch limit is 40; in Michigan, 50; in Oregon, 125. In Colorado the limit is 25 pounds of trout and 50 pounds of other fish *per diem*. In New Hampshire the limit is only 10 pounds. In New York and Indiana the solitary fisherman has an advantage, since in the former State he may take 24 bass in a day, while two in the same boat

may take only 36. A similar law in Indiana permits the "lone fisherman" to take 20 bass in a day, while two in a boat may take only 30. Many States now have sweeping provisions prohibiting the taking of fish in any way except by angling, which is defined to be fishing with rod and line with one, or possibly two or three, hooks. The laws also limit the size of the fish to be taken, and the angler is usually required to return all undersized fish at once to the water with the least possible injury. It would seem necessary nowadays to fish with a foot-rule at hand, in order to measure all doubtful fishes. Such laws appeal to the conscience, like many laws regulating our shooting, and their execution is often defeated by the elastic conscience of the angler. In many States it is now unlawful to fish in the night season, to take fish in nets or on "trot lines," or "snag hooks" stretched on lines across the lakes or rivers, to poison or dynamite the streams, to fish through the ice, to take fish near a dam and to drain ponds and streams with a view to taking all the fish therein at one full swoop when stranded on the bottom.

The true angler, however, has little fault to find with the laws regulating his sport. He has been the originator and promoter of many of them. There is a growing sentiment in favor of a small catch, the returning of the little fish to the waters, and against the many outrageous methods of capture which came near to ending the game.

The writer recalls an invitation to go fishing in Kentucky, when the performance consisted in following by boat a long line stretched across a river, upon which were suspended innumerable baited hooks. The line had been set at night and a great number of fish of many kinds were found suspended by the many hooks. Upon another occasion,

when angling properly for bass upon a little stream in Indiana and just at a time when the sport was most lively and every rod in the party was busy, a crowd of men came down the stream, entered our pool with a net which reached from shore to shore, proceeded to haul out all the fish of every size and description and walked off with the best of them, leaving the others to rot upon the bank. There was nothing to be said. Their rights were equal to ours, and as to might making right, their party was the stronger. It was not unusual for the farmers as well as the people of the towns to own large nets and use them on the small streams and lakes. The use of dynamite and poison and the draining of the ponds and streams were, of course, immensely destructive, and the wonder is that a fish remains.

It would be idle to catalog the laws regulating fishing, if space permitted, since our laws are made, amended and repealed with such rapidity that the catalog would be out of date before it was fairly finished. But a glance at the recent legislation indicates that the aver-

age bass must not be smaller than 8 inches and the average trout not smaller than six. The number of fish varies greatly, from 125 in Oregon to 20 in Indiana, and possibly a fewer number elsewhere.

Altho one would hardly expect to find much that is entertaining or amusing in the reading of dry statutes I have been both entertained and amused at the evident compromises which indicate the attentive ear of the legislator when listening to the voice of his constituency. In Vermont, for example, it is illegal to fish through the ice for trout, but not more than fifteen tended lines may be used through the ice for bass. In the same State, while a general slaughter of fish with the shotgun is prohibited, there is an exception in favor of shooting pickerel, with a gun held at the shoulder. Heavy artillery seems to have been driven off of all angling waters. In Maine one may use five lines through the ice.

In the Iowa law we find a provision that owners may take fish "as they see fit." Here we have a direct legislative

Trout Stream. Reproduced from a Water Color Sketch by the Author

Bass Fishing. Reproduced from a Water Color Sketch by the Author

acknowledgment of the importance of game preserving and a discrimination in favor of the rich which will, no doubt, prove injurious to the cause.

Iowa has another charming compromise in the law prohibiting fishing unless by hook and line. "Any person," so the statute reads, "may, between the 15th day of May and the 15th day of November, use not more than one trot line, in streams only, and *extending not more than half way across.*" It would seem necessary to have a wicked partner to complete the deviltry. Those interested in fish preservation may take some solace in the thought that a snag or anchor is not always handy in mid stream. In Iowa fishing through the ice is lawful, but the fisherman shall not have while so engaged, "any house, shed or other protection against the weather, or have or use any stove or other means for creating artificial heat." You may fish, men of Iowa, but you must shiver! This, no doubt, seems too bad just now that small oil stoves are so portable and so cheap. This provision against shelter and heat brought to mind a living picture of many Indians fishing through the ice in North Dakota, each seated behind a comfortable screen or wind-break, and beside a small fire which burned brightly on the

crystal surface of the lake. But North Dakota has now abolished this form of angling altogether.

In some States which prohibit night fishing we find provisions extending the time until an early bed-going hour and permitting a start an hour or more before sunrise. In Colorado the fishing ends at 8 p.m. Here we note also an important law, which provides that the public shall have the right to fish in any stream stocked at public expense, subject to actions in trespass for any damage done property along the bank. There were loud objections in several States not long ago to the preservers getting most of the State fish for the exclusive use of clubmen. The laws were at the outset but little observed. So long as the sale and export of the game fish were legal the temptation to evade the laws remained. Laws putting an end to the sale of game fish have everywhere put an end to the outrageous methods of capture above referred to. Some States except from the operation of the laws against the selling of fish, all fish caught on private preserves or brought in from other States. Such exceptions, of course, destroy the efficacy of the laws, for who can tell where a fish was caught?

The export laws are numerous and

varied. Some provide that the legitimate sportsman, who has taken his fish by fair angling with rod, line and single hook, may take a few fish home even if he lives beyond the confines of the State; in some States he must attach a tag to his small bunch, bearing his name and address, and carry his fish openly, so that all may see how many he has and who it is that has caught the fish and from whence he came. In other States a limited number of fish may be sent home by express, with a tag stating the contents of the package and other particulars as to person, place, etc. In many States the non-resident angler is not allowed to depart with his catch, so jealously are the fish guarded for those at home.

In the matter of license the non-resident angler has the advantage of the shooter. In most of the States a substantial sum is now exacted from the latter for the privilege of shooting, but the modern angler may fish without payment in all of the States but one or two.

It has been the writer's good fortune to see much fishing at its best, altho often carried away from it by the whirl of the grouse, the whistle of the woodcock and by the tracks of deer and elk and bear, "when the United States was a free country," as one complainant put it in writing to a magazine, complaining about modern game laws and game preserves. The change from old fishing conditions to the new has been rapid and startling.

Streams where a few years ago we used an oatsack for a creel and took enough trout before breakfast to supply the open air appetites of our military escort, privates as well as officers, have been fished to a finish, and places where we used to wander at will at any season and take quantities of fine fish are now not worth a visit, or are owned by clubs

or individuals who warn the public away with the untruthful statement on many signs that there is "no fishing here." Fish there are in abundance in such places, but they are for the few.

Much of our best fishing, like much of our best shooting, is found to-day on the preserves, where the supply is annually kept up. In one instance which I recall the ponds and streams were filled so full of overfed fish that a distemper appeared and a great loss followed. One need go no further than the north roads on Long Island to learn how much of the good fishing is now closed to the general public. The public has felt the restraint, and a few homicides are charged to the laws against trespassing on the preserve. While Iowa, as we have observed, seems to openly favor the rich, who may take fish "as they see fit," in Colorado the dear people may roam over any preserve at will which contains a stream or lake stocked by the State. In one of the States, I forget now which, all ponds containing more than a few acres are declared to be public waters.

There are many other changes than these enumerated which have taken place in many parts of the country. The writer fancies he sees a change in the appearance of the modern angler. Certain it is that there is often a trace of golf in the costume of those who fish in pleasant places strictly in accordance with many rules of conduct, self-imposed and in advance of the statutes made to govern fishing. While the brooks murmur and placid lakes reflect the image of the sky and forests the sport of angling will endure. "Men may come," different in many ways from those depicted as good fishermen in Walton's time, and "men may go," but the sport, like the brook, goes on forever.

CENTER MORICHES, LONG ISLAND.

## Arrival

BY EDWARD WILBUR MASON

WE thought that Spring would come with madding thrush,  
And countless brooks would lift their myriad psalm;  
But lo, she came with quiet and with hush,  
Her only voice the silence and the calm.

We thought that Spring would come with smile of cheer,  
All crowned with flowers like some triumphant queen;  
But lo, she came with shadow and with tear,  
And trembled lest her violets should be seen.

We thought that Spring would come from hight untrod,  
And like a vision dazzle land and sea;  
But lo, she came with grasses on the sod,  
And shamed us with her meek simplicity!

COUNCIL BLUFFS, IOWA.

# The Auto Boat. By Cromwell Childe

A YEAR ago it was the racing auto boat, owned by the man that had the automobile fever raging through his system, who thought he saw in the water a highway unbounded and unrestricted, furnishing a new field for speeding and amusement. To-day the power boat is slowly evolving; it is midway in the transition stage between a rich man's toy and a craft of moderate speed and considerable comfort.

Power boat, motor boat, auto boat are the names variously given to these nautical vehicles. No better and more comprehensive phrase has been coined, however, than "the automobile on water." These words express exactly the new sport, now growing faster, statistics show, than any other in America and promising the most interesting and fascinating development.

The racing boat continues; it has not been, nor is it likely to be, superseded. But a new phase is setting in. Power

boats built for pleasure and comfort, that can clip along at a good rate of speed, but are not dangerous, awkward

shells loaded with machinery and with room only for a working crew, are commencing to have the center of the stage. This is a development of the past winter's months. Scores of such boats have been designed, constructed and are awaiting summer days to be put into the water.

Abroad and here the racing boat's status and general plan is settled. Such a boat can only be of use for racing; she is a machine full of discomfort and risk to those aboard. It is simply a matter now of motor maker and hull maker working in greater harmony to get results, and practically any speed is possible. The cost has put any racing auto craft capable of making new records only within the reach of millionaires. The rich man's toy is still his toy.

E. A. Rlotte's "Standard"

On the other hand there is this new demand for a boat that can ply swiftly back and forth between country places and "colonies;" that can make little journeys day or night; that could carry a man in to business, if he were not more than thirty miles away from a neighboring city; that could tour inland waters that offer combinations of hundreds of miles of superb trips. Experimentally some hundreds of such boats, large and small, have been built for this summer.

may not be too much to say that two years from now the auto boat will be in the proportion of a thousand to one along these lines. The racing game is fascinating, but it takes too long a pocketbook. Three thousand to four thousand dollars will buy a really beautiful auto craft of the coming type, one that could readily carry a small party on the longest of inland water tours or be on the water what the good, reliable, speedy automobile, not a

Miss Swift

Their faults will doubtless be many and the bulk of them will probably be discarded before the season is over, but out of the new fleet should come a type that will eventually meet the demand.

One hundred boats of this order, it has been latterly said officially, have been or are being constructed to one built for sheer speed.

It is the convenience, roominess, comfort, ease of getting under way and smallness of cost that additionally appeal in this new class of auto boat. It

racing machine, is on land. It is no trouble at all to put one of these in motion. A few turns of the wheel and the gasoline engine is set going, and its fuel is cheap and readily procured.

Last fall, at the close of the racing auto boat season, when the records here and abroad had been overhauled and compared, the present writer wrote, and his conclusions are precisely applicable to the opening of the present racing season:

The boats are of slight draft and extremely thin, so thin, in fact, that it

The "Japansky," the Famous Launch of F. H. Waldorf

would seem as if the extreme of lightness of hull had been reached. Some hulls are finely shaped and some are ugly. As for comfort, what with the blinding spray that sometimes even gets under the necessary oilskins, the bad smell and the noise of the rapid explosions of the gasoline as the engine is urged to greater speed, this playing the part of a mechanic in the cramped quarters of the cockpit is far from the usual agreeable surroundings of the man of wealth. The drenching is inevitable, as the boat goes headlong through the waves, not over them.

Auto boating in the Mediterranean, where it flourishes off Monaco, has been described as follows:

"A wild welter through blinding, stinging spray, which makes a look ahead impossible, while the swirling hell we leave in our wake makes a look behind call up suggestions of many forms of suicide, all more enticing than this one. Conversation is impossible. Imagine the purring of a gigantic cat, magnified a million times, there you have our motor in gentle mood. Its monstrous throbbing beats madly on the tympana of our ears. It roars

around us. It gets in our veins, drives the blood fiercely through the heart, and fills us with one wild, overpowering, frenzied desire, a desire to overhaul that diabolical *trèfle-à-quatre*.

"In the nature of things, the craze for the racing auto boat can be only ephemeral. It will likely spend itself soon, and by winter more than one broken and battered craft will again bear witness to the utter uselessness of the boat built for speed alone."

Compare this account, especially the quotation on Monaco auto boating, with the following, an analysis of one of the most promising thus far of the motor boats not made to race:

"The recent launching of Mr. Harold Q. Pratt's new motor boat, 'Dodger,' at City Island, may almost be regarded as epoch making. The 'Dodger' is, in fact, the forerunner of a class of craft which is to be the logical evolution of the auto boat. Short lived by reason of its construction, of no earthly use except for racing purposes, and at best hardly more than an ephemeral craze to be indulged in by only those with money to burn, the auto boat was bound in the mind of the far-seeing to have a mission worth while by paving the way for gasoline driven pleasure boats of high speed power. The 'Dodger,'

which is built of steel, . . . along the lines of a torpedo boat and is ninety feet on the water line, is about as far removed from the prevailing idea of a swift auto boat as possible. Instead of her great speed going hand in hand with an open cockpit, in which crouch figures in oilskins, she has a very sizeable cabin with everything in the way of comfort for the owner and his guests. This is one of two motor boats which have been built according to the most advanced ideas for members of the Pratt family. Mr. John T. Pratt's boat . . . is only two-thirds the length of his younger brother's craft."

A recapitulation of the racing of last season is none the less interesting, now that the new year has been entered. After all, tho it is but one end of the story, auto boat racing is keen sport. It is costly, it is only within the means of the very rich, the boats are pure playthings; but the game is exciting. Here is the motor boat calendar for 1905:

May 1 to 15. Mediterranean races.

15. Juvisy, France, races.

30. Manhasset Bay races (American).

June 22 to 30. Kiel, Germany, races.

July 2 to 10. Rouen, France, races.

July 14 to 28. Southampton, England trials.

15. Calais to Dover, contest.

22. Brighton, England, races.

Aug. 1 to 7. Rouen to Trouville, contest.

6 to 9. Paris to Trouville, contest.

10. Trouville (for Gaston Menier Cup), races.

11. Trouville (for Drexel Trophy), races.

12. International Cup, races.

19. Albany to St. Lawrence River, cruise, American.

24 to 26. Chippewa Bay (Power Boat Association Challenge), races, American.

Sept. 1. Lake Geneva, Switzerland, meet.

11. England (Joe Harmsworth Cup), races.

12 to 14. Lake Lucerne, Switzerland, meet.

The 1904 contests (1904 being the first great racing year) brought some interesting results in this country. On May 30th at Manhasset Bay the season was started. "Panhard I" (A. Massanet) made the best showing for her rating, but was beaten by Cornelius Hoagland Tangeman's "Fiat II." The

A. Massanet's "Panhard I"

"Fiat II," Owned by Cornelius Hoagland Tangeman

"Japansky" of F. H. Waldorf covered the course at a speed of 20.20 statute miles. William K. Vanderbilt, Jr.'s, "Hard Boiled Egg" was one of the features of the year, a winner in the race of the New Rochelle Yacht Club on June

18. Here again the "Japansky" was a winner. The "Vingt-et-un" won a \$2,000 challenge cup in June at Larchmont. E. A. Riotte's "Standard" on more than one occasion proved herself to be one of the crack boats of the racing

"Shooting Star," One of 1904's Cracks and Still in the Field

field. "Water Lily," "F. I. A. T. III," "Swift Sure" (designed by Herreshoff), "Mercedes," "U. S. A.," "Mercedes VI" and "Shooting Star" came out with the others in the final races of the season, the matches for the Challenge Cup in September. There were ten starters, "Vingt-et-un II," a second edition of the original "Vingt-et-un," taking the Cup.

There has been promised for this year in these racing machines a considerable improvement in hull designs, but these boats are yet to appear. Launched late last year was a boat that was thought to have great possibilities, Frank Croker's Herreshoff "XPDNC," but Mr. Croker's death while automobile racing on land makes it uncertain how and when this craft will show. Lewis Nixon has a remarkable ocean-going motor boat, the "Gregory," which has now safely made the trip across the Atlantic for the foreign races. She is 90 feet long, has thirty tons displacement

and has made a speed of twenty-three miles. Another of the great racers of the hour is Harrison B. Moore's "Onontio," designed by H. J. Gielow, and thus far officially the first in world's record, having made the best mile of the year. She is 58 feet long. The "XPDNC," noted above, has the record for long distance racing, an average of 26.29 statute miles for 136½ miles, with no stops to take on fuel. "The Vingt-et-un III" is one of the foremost as the holder (see above) of the gold challenge cup of the American Power Boat Association, a trophy which she is to defend in June.

G. W. Childs Drexel is to have a twenty-eight miles an hour motor boat, sixty-two feet over all, that will be a racing factor. Crowninshield, of Boston, has designed a forty-foot boat for President Speare, of the Bay State Automobile Association. Among auto boat men there is much interest in these two latter craft.

BROOKLYN, N. Y.

## Benefits of a Vacation in Europe

BY CHAUNCEY M. DEPEW, LL.D.

UNITED STATES SENATOR FROM NEW YORK

I BELIEVE that the most recently accepted theory of the brain is that some brain cell moves every muscle and is related to some particular department of the mind; that the cells not in use decay or become atrophied, while the cells constantly used are abnormally enlarged.

As a result of this we find that the athlete, who seems to be a strong, healthy man whom we might expect to live to a good old age, dies young or resists feebly what people of much less physical strength withstand quite easily.

People who have preserved their prime, mentally and physically, after they have passed three-score and ten years are found to be all around men whose brain cells have all been kept active.

Now, a man who works with his mind

needs a vacation more than one who works with his muscles, because while at his occupation he neglects the muscular side and only a part of the brain cells are in use.

While a vacation is generally charged up to rest it should really be placed to the credit of change of occupation—of resting certain faculties and giving exercise to others which require it.

A man who is intensely busy and active, as I have been for forty years, in business, politics and on the platform, finds that the wheels of his mental machine get rusty at the end of ten months; that it requires extra exertion to do those things that before were easy; that there is a strain on the nerves, and that this warning, if unheeded, is soon followed by insomnia.

The question then arises as to how to repair the waste, revive the dormant faculties, prevent the brain cells which have not been used from becoming atrophied and give the muscular system a chance.

I tried for years taking vacations at home and returned to work tired. I found that when I took no vacation at all I was nearly as well off, unless in a gubernatorial or presidential year, when I spent three or four weeks on the stump and returned to work tremendously refreshed and invigorated in consequence. I finally explained this paradox of rest secured by means of hard work by theorizing that the benefit I received from stumping arose from my meeting tens of thousands of people, looking on new things, meeting new and interesting characters and having new and exciting experiences in regard to what moves or fails to move that most complex and difficult creature—an audience.

The more original people who have made success of some kind in life, who rose out of the mass and made an impression, contributed more than everything else to the freshening process.

On the other hand, when taking a vacation to the ordinary watering place, mountain or seaside, conversation was largely shop without the excitement of the real thing or business without the tools conveniently to transact it.

When I first went abroad nearly thirty years ago I was fortunately furnished with letters of introduction which brought me in contact with people of distinction, but for the first five or six years repair, renewing and refreshing of mind and muscle came from visiting historic places and seeing the marvelous designs of the old architects or the priceless paintings and sculptures which the Old World possesses in such great abundance.

To a university man who has kept up his reading in regard to classic and historic events there is an exquisite pleasure which no language can describe gained from visiting the scenes so often pictured in the imagination, and to one who loves fun and sees the humorous or ridiculous as parts of human nature the fellow travelers on the steamer or at the hotels abroad furnish more amusement

than any vaudeville show, comedy or farce; always provided one is not afraid—as many Americans unhappily are—to go among and talk to them.

“The Cookies,” as they are called, are to the right-minded and not too dignified person a never ending source of delight. They are so genuine.

When Baedeker has ceased to be a volume of thrilling interest, cathedrals no longer attract and old masters become a bore, the famous men and women of the Old World found in the great capitals like London and Paris or the international watering places like Homburg form a university on a higher order and with more varied instruction than all the summer schools put together.

If in your six weeks' outing you have met socially, so as to establish tolerably familiar relations, such a statesman as Gladstone, such men of letters as Browning and Tennyson, artists like the President of the Royal Academy and his *confrères*, journalists like the editors of the great dailies, men of science, educators and sportsmen, you have gained something which lasts a lifetime. If only one such conquest marks your outing it distinguishes the year.

The man or woman who works in intellectual pursuits, whether professional or business, letters or education, ten months of the year, finds at the end of that time an unaccountable feeling of fag and weariness and wonders if he or she is failing; but on returning from such a trip as I have described, with the rest of the sea both ways, life is found to be still full of joy and hope; insoluble problems solve themselves; the speech one thought he could never make bubbles up and out with scarcely an effort; the pen which dragged and blurred and blotted the page moves automatically as if under the control of an electric current, and the hostile conditions which filled one with despair are easily reversed.

To return to our original proposition, the person who has been lopsided, angular, with impaired vision and weakened forces from excessive travel in a rut, comes back from such an outing as I have described with all brain cells available and in normal condition to do his best with such powers as God has given

amid such opportunities as are his.

No American who enjoys the life and rushing tide of our country could live permanently abroad, but in his vacation conditions there make Europe a delightful sanitarium. It will be many generations before our business men or even professional people and those in the higher walks of finance and commerce can reach the restfulness of European life.

Even Philadelphia would get on the nerves of an English lawyer, statesman, banker, manufacturer or professional man.

It is just this calm prevailing in and about English society which gives opportunity and zest and relish for the discussion of the latest novel, the speech in Parliament, the new scientific discovery, the author in his first success, the newest beauty.

Americans read with envy and wonder the autobiographies which are constantly coming out in the English and Continental press, so largely made up of conversations in which the writer partook or listened. Conversation is still in foreign circles not an art, but a habit. The lawyer has no case, the business man no problem which he carries into the drawing-room or to the dinner table.

Men and women are deeply interested and thoroughly informed on internal and international parties; questions of party

success, of the motives of party leaders, of the speech of the rising young statesman and hope of his organization, of foreign policies and the motives of foreign diplomats and rulers and the possibility of complications and wars and what would honorably make for peace and whether it is necessary to be ready to fight, are all ripe topics.

In other circles are brilliant or at least interesting discourses upon the opera or the play or the leader in the newspaper or books or authors.

These conversations are quite often enlivened by personal anecdote and contributions of historic importance concerning measures and motives which have leaked out from Cabinet meetings or party conferences.

We all know how different it is with us, where the intense absorption of every faculty upon the main chance makes stock brokers consort with their customers and lawyers with their clients and the traders with their like, to burden each other by contributing profitless discussion of the profits and losses of the day.

This limits our women—who are easily, when they have the opportunity, the best and brightest conversationalists in the world—to the frivolities of fashion or entertainment, or the opera—where they find a bit of human interest in gossip behind a fan while the tenor or soprano fills the auditorium.

## Tales of the Sea

OF four recent books that contain stories, true or imaginary, of adventure on the high seas, that by Mr. Arthur Colton<sup>1</sup> is much the most diverting. Captain Buckingham, of Greenough, Long Island, a smallish man of fifty, with a bronzed face, a glimmer in his eye and a delicious vein of humor, unbosoms himself of his wanderings and the things that befell him over all *The Belted Seas*, and is himself the best part of the adventures he relates. As a lad of eighteen, he says:

"I was a wild one, tho not large, but limber and clipper-built, and happy any side up; and my notion of human life was that it was something like a cake-walk and something like a Bartlett pear, as being juicy anywhere you bit in."

How he went to sea with an ecclesiastical-looking pirate, how they scuttled the ship to keep her from the Spanish gunboat, how a tidal wave landed the good ship, "Helen Mar," bottom side up among the foothills of the Andes, and how Captain Buckingham and Stevey Todd kept her as a hotel, how they ran his realm for the King of Torre Ananias—always in search of their eternal fortunes, so that they could go back home and settle down—form the beginning of the breeziest sea tale of many a year. The dry, whimsical old captain spins a yarn worth hearing.

Mr. Morgan Robertson's stories gathered in the volume styled *Down to the Sea*<sup>2</sup> are in the last degree ingenious in construction and clever in the telling. They have, however, two serious faults: they are so far-fetched, so very remote and unlikely, that they lack the interest of possible happenings; and, except for the adventures of Finnegan, they are painful to the point of being disagreeable. "Fifty Fathoms Down," for instance, tells of a submarine, partly

flooded through a collision while running awash, and of her commander's courage in expelling his men through the torpedo tubes. Follow twenty pages of chemistry, narrating with immense ingenuity how Breen converted the sea water into gases, started electric fans, dried off motors, and conducted a course of chemical reactions impossible for the unlearned to follow, and, in a fortnight or so of hideous suffering, reached the surface and was exonerated by the Board of Inquiry from misuse of Government property. "The Enemies" details a course of surgical treatment, involving years of misery, through which a man goes to the end of inflicting a memorable vengeance on the man who had stolen and then abandoned his boyhood's sweetheart. Mr. Robertson's tales of iron ships, in short, are far more clever and powerful than his earlier stories of wooden ships, but they are not so good reading.

Alone of the four books in hand, Mr. Rowland's *The Wanderers*<sup>3</sup> is a novel—that is, to the extent of having heroes and heroines; yet it by no means fulfills the promise of its first chapters. Brian Kinard kidnaps his own yacht, claimed by an unloved half-brother, and he and Arthur Brown, an American marine painter and rover, take on board two derelict (and attractive) American girls and cruise through the Mediterranean. But first they are detained at Gibraltar to fight duels with Spanish officers, and the book is a third over before they are under way. The projected trading cruise in the South Seas, which would have afforded unrivaled possibilities for a yarn of commerce, adventure and love combined, comes to nothing. Instead Brown and Kinard have a wild chase after their own yacht, stolen from under their eyes; and the tale ends, rather weakly for the hero, after a typhoon in the Indian Ocean. On the whole, an unpretending

<sup>3</sup> THE WANDERERS. A Novel. By Henry C. Rowland. Frontispiece in Colors by Charlotte Weber. Pp. 392. New York: A. S. Barnes & Co. \$1.50.

Turkey Buzzard. From Job's "Wild Wings." Houghton, Mifflin & Co.

tale, entertaining for an hour or two, agreeable in its main personages, pleasantly written, abundantly varied in its kinds of interest and giving promise of better work in future.

The sea-journals and log-books kept by the captains that sailed out of Salem last century have furnished Mr. Trow with materials for a volume of only moderate interest.<sup>4</sup> They were stalwart and resourceful men, and they bore a great part in developing American commerce and trade with Asia; and this collection of anecdotes, quotations and character-sketches serves the worthy purpose of conveying a fairly good idea of the manner of men they were and the era in which they lived. Dipping into it here and there, one finds glimpses of a more heroic era; but as a whole this rambling volume has little to attract and nothing to hold the general reader.

## Bird Life

FROM the examination of specimens to the study of life is the great step which has been taken during the last few years in many branches of biological science, and especially in ornithology. We came

to realize that the plates in Audubon were not all that could be desired; that cabinets of bird skins, however necessary for classification, did not carry us much further toward acquaintance with the real bird. From "stuffed" birds, each stiff and formal on its perch, we advanced to the attractive and realistic groups with wax foliage and glass water which adorn our own museum; from a bird in a small cage to whole families flying freely in our park aviaries. The next step was to call upon the birds at their homes, instead of bringing them to us under unnatural conditions. This we cannot all of us find time to do and so we have to visit the birds by proxy.

There have always been bird watchers, but what we could get from them depended upon their powers of verbal description and ours of visual imagination. But now the new sport of hunting with the camera has brought us nearer to feral life than was before possible. Our sportsman President in a letter prefaced to Mr. Job's *Wild Wings*<sup>1</sup> approves of this substitution of the camera for the gun and says, "The older I grow the less I care to shoot anything except 'varmints'." Mr. Job's range is a wide

<sup>4</sup> THE OLD SHIPMASTERS OF SALEM. With Mention of Eminent Merchants. By Charles E. Trow. New York: G. P. Putnam's Sons. Pp. 337. Illustrated. \$2.50.

<sup>1</sup> WILD WINGS. *Adventures of a Camera-Hunter Among the Larger Wild Birds of North America on Sea and Land.* By Herbert Keightley Job. 160 Illustrations. Boston: Houghton, Mifflin & Company. \$3.00.

one; from the haunts of the heron among the Florida keys to the seal islands of Nova Scotia he photographs and describes the birds of the Atlantic coast. If any one thinks that the new sport lacks excitement and the zest of danger he should read the narrative of this enthusiastic hunter with the lens. His style of "hawking" is a great improvement over that of the ladies of the Middle Age. His photographs of egrets, ibises, terns, buzzards and petrels, in nest or in flight, are both beautiful as pictures and interesting from the difficulty of obtaining such snap shots of wild birds.

Until we get color photography it is

of his own observation and thought on the habits and instincts of birds. As he is a scientific man he avoids the error, now so common, of ignoring the distinction established by Plato between featherless and feathered bipeds, and so does not ascribe to birds the thoughts and feelings of civilized man.

Of an older fashion, but not out of fashion, is the *Bird Lore*<sup>3</sup> of Mr. R. Bosworth Smith, wherein the former assistant master of Harrow chats pleasantly of the owls and cuckoos, ducks and magpies of the County of Dorset. Birds are interesting to him chiefly in their relation to human beings and he interweaves with

"The King Row." Five Kingfishers in Line, Illustrating Habit of Sitting Still. Birds Shown are Thirteen Days Old. From Herrick's "The Home Life of Wild Birds." (Putnam's)

hard to see how book illustration can ever improve upon *Wild Wings* and the similar work on the *Home Life of Wild Birds*.<sup>2</sup> Mr. Herrick does not go so far afield as Mr. Job. He makes a closer study of our common birds, the wren, the robin, the bluebird, the kingfisher, the cedar-bird and others, using the method which he devised of placing the nesting bough in front of a green tent containing the camera. In this way he is enabled to watch the nest at close range all day and take snap shots under the best conditions of light and position. Professor Herrick gives full details of his apparatus and many suggestions for such life studies, as well as the results

his ornithology an abundance of historical allusions, poetical quotations and personal reminiscences—altogether a very delightful mixture. In his chapter on the raven he begins with those of Noah and Odin, and after catching on the way down all the ravens in history, poetry and folk lore, including Elijah's, King Arthur's and Poe's, he concludes by telling what he has himself seen in the nests of Dorset.

Less erudite but somewhat similar in style is Mr. Torrey's story of his rambles from Mount Washington to the Everglades in acceptance of *Nature's Invitation*.<sup>4</sup> Altho his gaze is ostensibly fixed

<sup>2</sup> THE HOME LIFE OF WILD BIRDS. A New Method of the Study and Photography of Birds. By Francis Hobart Herrick. 160 Illustrations. Revised edition. New York: G. P. Putnam's Sons. \$2.00.

<sup>3</sup> BIRD LIFE AND BIRD LORE. By R. Bosworth Smith. New York: E. P. Dutton & Co. \$3.00.

<sup>4</sup> NATURE'S INVITATION. Notes of a Bird-Gazer, North and South. By Bradford Torrey. Boston: Houghton, Mifflin & Company. \$1.10.

upon the birds, he has a sharp eye out for trees and animals and the idiosyncrasies of fellow-men. He uses an opera glass instead of a camera for watching the birds, but he is so skilful at drawing pen pictures that we see more through his eyes than we would in the best of photographs. The chapters on Texas, Arizona and Mexico deserts are of especial interest, for this ground has not been trod so often by the literary naturalist as New Hampshire and Florida.

### Books on Sports

SINCE 1885 in England the Badminton Library has year by year been discussing sports and pastimes with the gravity and thoroughness demanded by the true sportsman. But these volumes are in many ways unfitted for reference on this side of the water, and the excellent series<sup>1</sup> now being published by Macmillan, under the editorship of Mr. Caspar Whitney, editor of *Outing*, promises to successfully cover out of door sports as known to Americans.

Of the eight volumes before us four are on hunting. *The Sporting Dog*, a technical work on the different hunting breeds in use in the United States, gives accounts of the most famous in bench shows and field tests and a suggestive chapter on training. *Guns, Ammunition and Tackle* is again technical, with papers by specialists in the different departments, the shotgun, the rifle, pistol, revolver and with three fine colored plates for the chapter on the artificial fly. *Ox, Bison, Sheep and Goat*, being made up of an essay by Caspar Whitney, two by Owen Wister and one by George Bird Grinnell, is quite as entertaining to the stay-at-home hunter as to the wanderer over ice field, mountain and plain. *The Still Hunter*, by T. S. Van Dyke, studies exhaustively that difficult and truly scientific

sport, and is most originally illustrated by diagrams with deer or hunter enlarged to show the manifold mistakes in this business which can be made by the man—the deer is less apt to make them. How to select, train and ride a saddle horse is clearly and practically explained by Mr. Edward L. Anderson by means of print and photography, and in the latter half of the same volume Mr. Price Collier not only tells how to drive single, double and four, but also gives a large amount of practical information on the care of horses in sickness and in health, shoeing, harnessing, feeding and stabling. *The American Thoroughbred* includes a very comprehensive history of racing in the United States from George Washington to August Belmont.

*Yachting*, by W. P. Stephens, gives the genesis of the modern yacht from the sloops of Gloucester and Salem and the sailboats of the Hudson. There are accounts of the more noted shipbuilders and of the development of the different styles of vessels as well as the story of the cup races and a chapter on the power boats of recent date.

The book on *Lawn Tennis* will be valuable to every player of the game for the many clear illustrations and the comments on the styles of the best players, both English and American.

Mr. Dwight W. Huntington's *Our Big Game*<sup>2</sup> is a companion book to his "Our Feathered Game," and brims with vivid stories and adventures with grizzlies, moose, polar bear, wildcats, bison and other big game. He is a naturalist, a hunter and a raconteur, and leaves the reader with but one desire—another book of the same sort.

"The secret of the charm of angling is found in the angler's preference for studying rather than destroying his favorite species." So says Mr. Bradford,<sup>3</sup> who is a practical fisherman, with a good dash of idealism. He knows about equipment and times and seasons and what medicine to carry on trips, and as to flies and bait. He knows the pleasure of a fire on the seashore and the sea bass broiling thereon. His en-

<sup>1</sup> THE SPORTING DOG, by Joseph A. Graham. GUNS, AMMUNITION AND TACKLE, by Capt. A. W. Money and others. MUSK OX, BISON, SHEEP AND GOAT, by Caspar Whitney, George Bird Grinnell and Owen Wister. THE STILL HUNTER, by T. S. Van Dyke. AMERICAN YACHTING, by W. P. Stephens. LAWN TENNIS, by J. Parmlly Parot and William Harvey Madden. RIDING AND DRIVING, by E. L. Anderson and P. Collier. THE AMERICAN THOROUGHbred, by Charles E. Trevothane. American Sportsman's Library, illustrated. New York: Macmillan. \$2.00 each.

<sup>2</sup> OUR BIG GAME. By Dwight W. Huntington. Illustrated. Charles Scribner's Sons. \$2.00.

<sup>3</sup> THE ANGLER'S SECRET. By Charles Bradford. G. P. Putnam's Sons. \$1.00.

thusiasm colors every chapter. The atmosphere and the interest are not of the town, and at times the English is not.

**Another Hardy Garden Book.** By Helena Rutherford Ely. With 49 full page illustrations from photographs 16mo, pp xv, 243. New York: The Macmillan Co. \$1.75.

The author's first "Hardy Garden Book" was deservedly popular, and this, its successor, shows the same intelligent, practical commonsense. The kitchen garden chapter is probably the most useful one in the book. It is valuable because the directions are so much

simpler and easier to understand and remember than those in the catalogs or more elaborate garden books. The chatty style, with the occasional receipt for cooking the vegetable, as also given in "Pot-Pourri from a Surrey Garden," gives an added interest to the chapter. The rules for planting trees and the advice about the use of native trees are both sensible and valuable. The short selected lists of garden fruits and fruit trees, perennials, lilies and vines will be found most helpful to those planting a new garden. But the charm of the book rests in the reader's companionship with an intelligent, agreeable woman, who loves her garden.

A Single Blossom of *Anemone Japonica Whirlwind*. From Ely's "Another Hardy Garden Book." (Macmillan)

**The Teaching of Biology.** By Francis E. Lloyd and Maurice E. Bigelow. New York: Longmans, Green & Co. \$1.50.

Altho the teaching of biology in secondary schools is engaged in by many hundreds of teachers in this country, the possibility of there being a science of teaching the subject is probably realized by very few of them. The method of the old-time teacher of botany, who was interested primarily in classifying plants, and the method of the modern university-trained teacher of biology, who tries to repeat with his classes of young pupils the work he did himself in college, each has passed in its own time as the proper method, but both have failed to bring results which the native interest of human beings in biological phenomena would seem to insure. The authors of *The Teaching of Biology*, from their peculiar vantage point of being teachers in an institution which has for one of its functions the scientific study of meth-

ods of instruction, have given to the teaching public an elaborate and intensely interesting exposition of the claims of biology in the fields of general education. For the high school teacher who has been struggling against possibly discouraging circumstances, too busy and too exhausted with the labor of keeping his few little cogs of public school machinery well-oiled and moving to give deep thought to what he is actually doing, Professors Lloyd and Bigelow have performed a service which cannot be overestimated. The overcrowded, and

the sometimes ill-trained, teacher loses faith in his subject in a few years after leaving college unless he can keep in touch with the spirit of learning. It is to his great advantage, also, to have an opportunity like the one offered in this book to inform himself concerning the philosophical principles which underlie the teaching of his subject in order that he may justify to himself and to others the employment of the science of biology as a part of the general scheme of education.

**How to Make a Vegetable Garden.**

A Practical and Suggestive Manual for the Home Garden. By Edith Loring Fullerton. 250 illustrations. New York: Doubleday, Page & Co. \$2.00.

The possibilities of photographic illustration of plant life were never realized until the appearance of *Country Life in America* and the *Garden Magazine*. One might think that picture of vegetables and tools would be unattractive and uninteresting, but that would be before

Golden Bantam Corn, Early and Sweet. From "How to Make a Vegetable Garden" (Fullerton). Doubleday, Page

he understood how Doubleday, Page & Co. print them. If there is anything mentioned in this book that is not illustrated we fail to find it. One can save on the gardener's wages because it can be put into the hands of one who is entirely illiterate. But we must not omit to add that besides being a good picture book, it contains practical and detailed directions for making the best use of a small garden from the preparation of the soil to the cooking of the vegetables. Many a commuter will find the book useful this summer.

**How to Know Wild Fruits.** A Guide to Plants when not in flower by means of fruit and leaf. By Maude Gridley Peterson. Illustrated by Mary Elizabeth Herbert. 12mo, pp. xliii, 340. New York: The Macmillan Co. \$1 50 net.

We have examined every one of the 80 wood cuts in this volume, and must pronounce them correct and helpful, altho, of course, they lack the help of color; but that would involve a much heavier price. It is a book chiefly for amateurs, for summer and autumn visitors in the country, where time does not allow to follow the growth of the plant or tree from the blossom, and so it is not a book for accomplished botanists. Accordingly, while descriptions of three hundred fruit-bearing plants are careful and scientific enough, and a key will send

the botanist to the order and species, the plants are arranged for the use of the casual student by the color of their fruits, after the style of Mrs. Dana's book for flowers, which is perhaps the most convenient way for those for whom the book is intended. It meets a want, and we are glad to recommend it as a useful guide.

**The St. Lawrence River.** Historical—Legendary—Picturesque. By George Waldo Browne. Illustrations and map. New York: G. P. Putnam's Sons. \$3.50.

The oldest known of American rivers has had to wait until now for a volume devoted to description, and, considering the number of tourists who visit some part of it every summer, there should be

A Spill on the Toboggan Slide. From Browne's "The St. Lawrence River." (Putnam's)

a demand for such a book as this. Mr. Browne manifests no great originality or literary power, but he weaves together history and geography, legend and description with sufficient skill to make it all readable to one who has any interest in the subject. The plan of describing the river from the ocean to the lake is a good one, for it enables the author to bring into his story almost in chronological order the men whose names are associated with the great

the lurid dime novel to the milder but no more truthful stories of sentimental cowboys now popular, that it is refreshing to find books like Mr. Adams's which deliver a round, unvarnished tale without an artificial plot and adventitious incidents. They are the real historical novels, for they record a state of society now vanished but not so far in the past but that it remains in the memory of men. It has only been some twenty years since long horned cattle were being driven

A Stampede. From "The Outlet," by Andy Adams. Houghton, Mifflin & Co.

river, beginning with Cartier, who discovered and named the Bay of Saint Laurens, and Champlain, who founded Quebec, and thence on in current of history to Frontenac, La Salle, Wolfe and Montcalm. Further up the river he introduces to us the *voyageurs* and *coureurs de bois*, and finally, among the Thousand Islands, he tells of the wars of the Algonquins and Iroquois.

**The Outlet.** By Andy Adams. Illustrated by E. Boyd Smith. Boston: Houghton, Mifflin & Co. \$1.50.

There have been so many foolish romances written of the Wild West, from

overland from Texas to Kansas and Nebraska, but the scenes described in this book are as completely in the past as the crusades. Mr. Adams has not the picturesque style of Owen Wister, but he tells of the dangers of the great drive, from stampedes, from alkali water, from drought, from flood and from men, in a straightforward and convincing way.

**Garden Colour.** Spring, by Mrs. C. W. Earle. Summer, by E. V. B. Autumn, by Rose Kingsley. Winter, by Hon. Vicary Gibbs. Notes and Water Colour Sketches by Margaret Waterfield. New York: E. P. Dutton & Co. \$6.00.

This elegantly printed volume with

over fifty full-page illustrations in color has a double value, for its beauty and for the practical information it gives on the selection and grouping of garden plants for color effects. The flowers and foliage plants which are available in each season of the year are arranged by months, so that by proper care the garden need never appear barren or *en dés-habillé*. The directions, which are written for English conditions, will doubtless have to be modified somewhat for our very different climate, or rather climates, but this does not seriously impair the usefulness of the work. From the large amount of information furnished any one will be able to select the flowers best suited for borders, designs, screens, picking, massing, or whatever his special object may be.

**Roma Beata.** By Maud Howe. Boston: Little, Brown & Co. \$2.50.

It would be difficult to find more vivid, sympathetic or delightful pictures of modern Roman life than the flashlight impressions one gets in Mrs. Elliott's *Roma Beata*. Out of a mass of material, contained in letters written home during a seven years' residence in Rome, she has chosen with a sure knowledge bits of history, gossip and description which, deftly woven into a connected narrative, give a singularly complete idea of the life, in a foreign city, of one whose lively sympathy embraces a heterogeneous multitude of which the Pope and a crabbed hunchback cabman are mere units. And these pictures are all surrounded by the unmistakable atmosphere of Rome, modern Rome, which is at the same time pagan and medieval. The telephone was at first a shock to Mrs. Elliott's sensibilities as being blatantly modern, but when, through this despised invention, she was asked with hesitation if she objected to meeting a certain Frenchman who was charged with possessing "the evil eye," she was consoled; Rome is not yet too Christian. As we read these graphic descriptions we remember the very scent and sound of the Eternal City, an indescribable odor of antiquity and freshly sprinkled flowers, a confused murmur of flowing water and many cheerful, babbling voices. In unfolding her pleasant life in an old Ro-

man palace Mrs. Elliott has achieved a style, very rare among American authors, which is delicate, bright and witty, but without a taint of flippancy. She saves herself from being superficial by her insight into the character of an alien people and by her abiding memory of their historical background. She has also added a soupçon of science to her pot-pourri by an intelligent account of some excavations in the Forum. But the hospitable home with its human interests, its native servants, its many guests, its pets from Jeremy Bentham, the tortoise, to Pan, the nightingale, dominates all.

### Literary Notes

THE TWENTIETH ANNIVERSARY of the establishment of the publishing business of Silver, Burdett & Co. was celebrated recently by a luncheon given by Edgar O. Silver to 100 of his business associates, past and present.

....Ranke's "History of the Reformation in Germany," translated by Sarah Austin and edited by R. A. Johnson, is published in a single well-printed volume of nearly 800 pages for \$1.50. This gives an opportunity for any one to add this standard work to his library.

....Mr. Edward J. Wheeler will assume editorial control of *Current Literature* in July. Mr. Wheeler has made such a great success of the *Literary Digest*, which he has edited for ten years, that there is no doubt he will bring his new magazine rapidly to the front. Mr. Francis Whiting Halsey, author of "Old New York Frontier," takes the position of managing editor of the *Digest*.

....Those who may be incited to adopt the sport of "land cruising," so enthusiastically described on another page, will find very useful the "Automobile Good Roads and Tours," published by the Hartford Rubber Works Company (Hartford, Conn. \$2.00). It gives in convenient form detailed directions for following the best automobile routes from Montreal to Washington and from Portland, Me., to Cleveland, O., with information as to hotels and garages, and other advice to motorists.

....The effort to establish at Atlanta a high-class negro magazine deserves notice. *The Voice of the Negro* has not as much money behind it as some other magazines, but it is intellectually strong and most creditable, as might be assured from such editors and contributors as Professors DuBois, J. W. E. Bowen and Kelly Miller. Professor DuBois has a very interesting subject in "Slavery in Greece and Rome." We wish he had told us how numerous were negro slaves and how far their blood has mingled in Italian veins.

## The Uprising in Philadelphia

HAVING learned from an honest and vigilant press that they were about to be robbed of \$100,000,000, and that they and their descendants to the third generation were to be taxed for the enrichment of a band of thieves, the people of Philadelphia revolted. They were familiar with municipal robbery, having submitted to it for many years, but it now appears that there were limits beyond which their corrupt bosses could not safely pass. The growing protest of the people, persistently stimulated by uncorrupted and fearless newspapers, found support, somewhat unexpectedly, in a Mayor whom the bosses and their followers had elected by the customary fraudulent vote. Failing to measure correctly the force of this popular revolution, the bosses and their corporation allies unwisely proceeded, by means of their willing tools in the Councils, to complete their raid upon the people's pockets.

Fortunately, the Mayor had not yet been deprived of his rightful powers, altho a boss-controlled Legislature and an unworthy Governor have taken measures to make his successor a mere figurehead. He promptly removed from office the men upon whom the ring chiefly relied for local political influence and the sinews of corrupt war. By the severest social ostracism, together with effective menace, there were gained for the cause of honesty enough Councilmen to sustain the Mayor's veto of the infamous gas lease. Before the final vote could be taken the conspirators acknowledged defeat by withdrawing the proposed contract, hoping thus to save the ring's "machine" from utter wreck.

The fight is not ended, but the people of Philadelphia have won the first round of it. No longer do they deserve to be called "corrupt and contented." But their righteous discontent must be nourished and sustained

if they are to win anything more than a temporary victory over the corrupt forces that have made their city, with respect to its government, a byword and a reproach. Now is their opportunity to make themselves free. A grand uprising is led by a strong press and by a Mayor who has burned his bridges behind him. He must go forward, and we are confident that he really desires to do so. If he should turn back, it would be to ruin and obscurity. Pressing on, both the Mayor and his people will have the earnest sympathy and plaudits of every American municipality and every honest and enlightened American citizen.

What is needed first in Philadelphia is the organization of the honest citizens of every ward for war upon the thieves. Only by means of such organization can there be any progress toward a reform of those election abuses which support the bosses and the ring. It is not enough by social ostracism and threats to make a scoundrelly Councilman cast one honest vote; an honest man must be elected in his place. And honest men must be sent to the Legislature at Harrisburg, for the city bosses are powerful there. Philadelphia needs a system of personal registration. The voting lists have been under the control of the off-scourings of the town. Even burglars have padded them to serve the purposes of the ring. At some recent elections as many as 80,000 fraudulent votes have been cast. It is by such dishonesty at the polls that the city has been made to sustain a chief boss so heartless that he withheld from public use for a year or more an appropriation sorely needed for the prevention of deadly typhoid infection, simply because the conditions of the time did not permit him to control the expenditure of the money. He was morally responsible for hundreds of deaths. In the public press he was held responsible

for them, but no proof of such guilt could disturb his mind.

Absolutely necessary, therefore, are the reforms which will give Philadelphia honest elections. They can be obtained only by persistent and earnest effort, by continuous organization, by appeals to the Legislature, by the exertion without cessation of all the influences that good citizens can command. And the only issues at city elections should be those of the municipality. National questions should not be involved. The inquiry should be not whether a candidate for local office is a supporter of the protective tariff, but whether he stands for honest municipal government and will shut the door against thieves.

It is unfortunate that in arousing and in keeping alive that public sentiment and that civic interest which are indispensable for the promotion of political and municipal reform, the people of Philadelphia must contend against the hostile influence of great corporations. Last week they applied pressure of various kinds to unworthy and traitorous Councilmen. No more remarkable exhibition of social ostracism and business boycotting and public denunciation, all for a good purpose, was ever seen in an American city. But these men were only the tools of others more powerful, who had elected them (by fraud, in many instances) merely in order that their votes might be available for corrupt projects, such as gas leases and the like.

Have any of these other men been ostracised in Philadelphia? Through all this controversy has not the chief boss himself, who "jammed" the gas lease ordinance through the Councils, continued to be the intimate friend and almost constant companion of that Senator of the United States, a graduate of one of our greatest universities, who is a resident of the city which the ring sought to plunder?

And the officers of the great corporation which proposed the lease, and for whose benefit, in part, it was accepted by the subservient Councils—have any of them been ostracised? Much of the good work against the conspirators who sought to fasten this lease upon Philadelphia for 75 years has been done by the citizens' Committee of Seventy. The

chairman of this Committee, Mr. Winston, a Quaker merchant of large fortune, sought to employ special counsel for his organization. He has published the story of his search. One prominent lawyer after another (he gives their names) declined to serve because of their relations, direct or indirect, with the great corporation (the United Gas Improvement Company) that proposed the lease, or with the capitalists interested in it. At last he was compelled to employ counsel in New York. These gentlemen who declined to serve are not, of course, assisting the citizens who are protesting against the job. Do they not deserve a little of the ostracism to which the Councilmen have been subjected?

Mr. Winston also reports his interviews with several prominent officers of leading financial corporations, whom he urged to assist the Committee. He gives their names. All of them declined because their financial interests were involved in one way or another with those of the United Gas Improvement Company or its directors. Are they to learn by any forcible expression of popular opinion that they are regarded as enemies of the public welfare?

One Councilman deserted the bosses because his wife was shunned by her neighbors and his children heard at school the cry, "Your father's a gas thief!" Another was converted because only two or three men continued to buy drinks in his saloon. Such punishment appears to be just, and for the moment it has been effective. But if the people of Philadelphia are to secure permanent freedom, their ostracism of civic traitors must not be confined to the tools placed by the bosses in the Councils.

## The Great Japanese Victory

FOR once the news of a great battle will carry joy to Mr. Smiley's peace conference at Mohonk Lake, for it brings us hope that the terrible war which insults Christianity and humanity is nearing its end.

Apparently it is a complete and overwhelming victory for Japan. No matter how one's sympathies may follow the new island Empire, one cannot withhold

a meed of admiration for the courage, to rashness, which carried Rojestvensky's fleet from the Baltic into the very jaws of the Korean Strait. It was a desperate venture, and doubtless the Russian Admiral believed that he had the better ships and the heavier guns. But he could not have believed that he had the better men. Behind Togo stood the advantage of training and experience, added to the test of far superior intelligence and patriotism. The Japanese officers had made the most complete study of naval tactics, and their men were ready to die for Nippon.

We give elsewhere the first rough estimate of the fruit of this victory. It ends Russian hopes of equality at sea for years, until a new fleet can be created. As a sea Power Russia is annihilated. Japan still rules the Pacific, and there is not a battleship or cruiser that can prevent her from supplying her army in Manchuria. Now she can proceed with leisurely fatality to invest and capture Vladivostok and to seize Sakhalien and the entire Amûr and Siberian coast to Kamchatka. Japan can now give her undisturbed effort to the expulsion of the Russians from Manchuria; and the end of the fighting, if not of the war, must be near. Russia's only last chance now is to retire beyond Lake Baikal, and reorganize both fleet and army, hoping to renew the conflict five or ten years hence, and with scarce any better prospect of success.

But what an outlook this is for Japan! What an Empire she will have! For we cannot doubt that the entire Russian coast will be Japanese, and Russia utterly driven from the Pacific. The Japanese demands would have been heavy six months ago; they will be much heavier now. When *THE INDEPENDENT* first said that Japan might claim the region east of the Amûr River it seemed like an extravagant claim; now it is only moderate. The case will stand: Formosa on the south; Saghalien on the north; Japan between, and no fear from our possession of the Philippines; then the control of Port Arthur, and the possession of Korea and Amûr and the Siberian coast will present an absolute bar to all hopes of Russian influence on the Pacific. Only on Mongolia, in further Asia, can

Russia cast a longing eye; and there she will have to meet an awakened China, who will, in the future years, have to be reckoned with—not much longer an Eastern Sick Man.

But we believe that this result will hasten a real peace; for we believe that the utter collapse of the war party in Russia will make for liberty and reform and internal rather than external expansions. Terribly is it needed. Some strong man will arise who will control the kaleidoscopic weakness and vagaries of the indecisive Czar. The revolution will take new force, and a constitutional Government will be slow to stir more war. The Russian defeat is a great Russian blessing, and a blessing to the rest of the world.

## The Standard of Human Worth

IN his interesting discussion of the near future of American society, published in *THE INDEPENDENT* a week ago, Professor Ross ventured a prediction that efficiency would become the mark, or standard, of human worth in America.

We are passing through a period of mammon worship, in which men and women are socially graded according to the money that they possess. Professor Ross gives good reasons for believing that this period cannot last. He says truly also that aristocracy has passed away, and with it the grading of men according to distinctions of birth, and that culture, or the mere power to enjoy, can never become a universal standard of human excellence.

We suspect, however, that in selecting efficiency, or the power to do, as the standard destined to prevail, Professor Ross has been influenced by that Western spirit, of which he is himself a fine example, to a greater extent than he realizes. He shows how the West has hitherto molded American life. Beginning with the first advance of population beyond the Alleghanies, the tides of migration swept across the Mississippi Valley and the great plains to the Pacific Coast, and the movement was unchecked until, in the early nineties, the last free homesteads in the rain belt were taken up. In that vast Western land men found opportunity, they were equal, they

were independent. The social life evolved was that of a reliant democracy. Men were valued as men, and not for their possessions. The power to do was the prime condition of success and of happiness. Efficiency was the standard of human worth.

For more than two generations the West, radical, democratic, efficient, has been the master-power in our national life. Henceforward, however, Western conditions must approximate Eastern, and the nation as a whole must approximate the Old World civilization of Europe. Our social life can no longer be shaped by forces generated on the geographic frontier. They will be shaped by forces generated in the teeming centers of civilization.

Now the dominant fact in any established civilization that continues to make progress is the diversion into intellectual and moral channels of the energies of that variable, restless, adventure-loving, convention-breaking element which every community gives birth to, generation after generation. So long as there remains a physical frontier not too difficult of access, thousands of the restless spirits find their opportunity there. With the passing of the frontier they have to find new opportunities and new forms of expression, or they "break out" in lawless ways. They create a new life, or they explode. Collectively they are the force that transforms society when the avenues by which the discontented have hitherto escaped from society are closed. They are the force that will transform American society from this time on.

It is worth while, then, to call to mind some of the things that this collective force of radical spirits, the adventurous souls, the convention-breakers, have hitherto achieved for mankind when, unable to escape from society to some free frontier, they have been compelled to work in it and to transform it. To go back no more than two thousand years they created Christianity, a religion of protest, of radicalism, of both socialism and individualism; in short, of liberty. They lit the fires of the revival of learning, and of the Reformation. They emancipated the serf, and created parliamentary government. They threw the

searchlights of the eighteenth century *Aufklärung* upon superstition, tyranny and outrage. In the storms of the French Revolution they swept away intolerable despotisms, and in the nineteenth century they have created an infinitely marvelous realm of scientific knowledge. Art, literature, religion, science, these all are the work of irrepressible spirits who, unable to escape from convention and tradition-bound society to any geographic frontier, have sought and found their liberty on the frontiers of the mind.

And here we come back to the question of standards. The standard of human excellence that these rare spirits create and hold aloft in the centers of established civilization is not that of efficiency. Themselves efficient beyond all measurement, they see in efficiency only a means to something of infinitely greater worth. That something, as the frontiersmen of the soul in every age have conceived it, is *genuineness*. To be one's self and not somebody else; to be natural and not distorted; to be fearless and not beholden to the powers of Philistia or of Mammon; to be honest not only in friendships and in commercial transactions, but also intellectually, and above all with one's self; these have been the marks, the standards of excellence, to the men and women that have achieved the work of social regeneration in the older communities.

And when one takes time to think the problem through, soberly and broadly, he is bound to see that this one standard of excellence—*genuineness* in all things—is the only one that can be accepted by vast and differentiated populations if they are to realize the ideal of a harmonious social life in which each individual lives sympathetically and helpfully with others. For the foundations of such a life are sincerity and naturalness, such as have hitherto been found in the social relations of the physical frontier. To remold our conventions and customs; to reformulate our laws; to re-correlate our institutions, so that in the centers of dense population, in the world as it will be when its geographic frontiers have vanished, every man shall yet have his chance and his freedom to be himself, to live his own life sincerely and

naturally and, therefore, sympathetically and helpfully; this is the work and this the way by which the life of mankind can still be made progressive and ever more worth while.

### In a Strawberry Bed

You will walk tenderly; for the fruit lies almost as a carpet and we cannot have enthusiasts prancing about without consideration. To be sure, you are carried away with the new vision. You have been accustomed only to see strawberries in boxes—a little mussy and massy, and without individuality at all. You never before saw *a* strawberry, one great handsome fellow, lying on his side and looking up at you temptingly; but, as soon as you see one, twenty more are calling to you from their earth couch, in every stage of ripening—and then—why, really there are millions of them. Pretty soon you have grown cool enough to compare varieties as well as individuals. We shall let you do this for a while, for a feast of the eye in a strawberry bed is almost as good as a feast of the palate. In fact a few of the handsomer sorts are intended for shipment and are rather better to look at than to taste. They are the sorts we send to the cities and are selected because they are solid, rather than because they are sweet and fragrant.

Now a true strawberry is not often found in the cities. After living with strawberries, being a companion of fruit for a few years, we learn never to eat a Wilson, or a Crescent, or a Bismarck, or a Warfield; these we send to market. We ourselves have got away beyond that sort of berry and our educated taste requires a Marshall, or a Sample, or a Margaret, or a Climax. Ah, well we know the shades of flavor. A true strawberry does not need a touch of sugar; it contains in its own make up enough of granulated sweetness—more would only spoil its individuality.

What is that huge, rich red berry? Well, it is evident that you are beginning to be able to distinguish varieties. You are pointing at a Mark Hanna. It has a history, without politics in it. An Englishman, down in Virginia, is a dreamer. He dreamed for a long while

of getting rich by selling plants. But after a while he became impatient with the mere routine of selling what others were also selling, and then he began to create new things for himself. He has brought into existence thousands of new strawberries—destroying most of them, of course—and of all that he has produced, you are looking at the supremest result. Mark Hanna is huge, but it is also delicious, and it yields immense crops. It combines in one about all strawberry ambition, is big, sweet, sound, high colored—and it is democratic. It does not believe in race suicide.

Next to it is Commonwealth, a new claimant for favor, of which they say that fourteen will sometimes fill a quart box. Next to that is Kittie Rice and the third in the row is Sample, both of these among the very finest products of the creative art in horticulture. Neither by looking nor by tasting can you tell which is finest? To be sure, and who can? The first is a New Englander, the second a Kentuckian, and the third has become so cosmopolitan that nobody cares where it came from. It will grow everywhere, in all sorts of soil, and stand neglect. In the next row are Beaver, Latest and William Belt, another trio of the highest achievements of horticultural art. Altogether you have just before your eye a half dozen strawberries hard to equal as yet in the whole world. But they will be equaled and they will be surpassed.

Nobody knows what is to be the future great strawberry. It is already ten times bigger than it was one hundred years ago, and, say what you will about them, the cultivated berry is just as delicious as any of those that used to grow in the meadows. To make it another ten times bigger would be to turn it into an apple, not to be eaten with cream, altho still good for shortcakes. But we may double the size, increase the richness of flavor and make it more hardy. The ideal strawberry just now is twenty to a quart—altho some sorts do better than that—plants as large as a peck measure, each yielding four quarts in a season, and in the rows looking very much like hills of potatoes.

You seem to be losing your enthusiasm. There is some excuse for it.

Strawberries should be discussed in two ways. Sit down on that turf and hold that huge rhubarb leaf in your hands. Here are samples of four of the best varieties. That is enough to begin with; you must learn to eliminate. You should not gobble down these divine gifts as the chickens do—but there! That is right! Try half of one, then half of another, and report conclusions. One can be very patient with a judge, under such conditions. Remember, all this while, that you do not have to eat strawberries in the country as you do in the city. There is enough and to spare. You can take your time about it and get well acquainted with each sort.

Senator Dunlap is another illustration of what we have called a cosmopolitan. It grows everywhere and it does well in all sorts of soils. There is something curious about this readiness of some things to adjust themselves to all sorts of conditions. It is true of some larger fruits. The Red Astrachan, the Northern Spy, the Winesap, the Wealthy grow well in Florida orchards, and then again they are equally successful in the farthest Northern fields of Maine and Minnesota. It is exceedingly interesting to find that our Moore's Early, Worden, Niagara and other most hardy grapes thrive just as well in Texas and Georgia. The new Japan hybrid plums have a belt nearly as wide as the whole United States. You can grow the Burbank and the Climax from New Hampshire to New Orleans, and then again from California to Vancouver's Island. It is so among other plants. The dandelion, the blackberry and some of the clovers are at home about equally well from the Gulf of Mexico to the Klondike—while over them everywhere sing the bluebird and the robin, while the crows caw and the mourning doves drum in the distance.

Crawford says of the strawberry that it is "a cold-blooded plant," liking more a northern slope than a southern. But, after all, it is hard to find any place where you can grow beans and potatoes that you cannot grow this delicious berry. It belongs in the smallest garden, with only woman's fingers to tend it, and it belongs equally well on the prairies of Indiana and the foothills of Missouri, where it can constitute the entire lading

of whole trains of cars, loaded at night and rushed to market before daylight. In Arkansas and Southern Missouri there are 6,500 acres of strawberries, 1,500 carloads in a single year from this section alone. One farmer reaped from 350 acres \$100,000 in 1903. And yet the market demand is steadily on the increase. Everybody likes the strawberry. It is companionable, and to cultivate it teaches the grower many a lesson of thrift, care and precision.

## Cathedrals and Minsters

"A PRESBYTERIAN CATHEDRAL" for Washington is what Justice Harlan proposed and for the erection of which he offered to give his active service. He had first suggested the plan and had received support and encouragement from distinguished Presbyterians over the country whom he had consulted on the matter. With this encouragement he presented the scheme to the General Assembly. But it had to be admitted, on the floor of the Assembly, that it was by no means clear that the Washington Presbytery was enthusiastic about it, and finally a committee was appointed to consider the matter for action at the meeting of the Assembly next year. The committee will consult with the Washington Presbytery and learn what are the objections, if any.

Some of the Presbyterians at Washington and elsewhere raised the pertinent question what use the denomination would have for a cathedral. The word seems to connote display and grandeur, while Presbyterians have a history of ecclesiastical simplicity. Would not the erection of a Presbyterian cathedral seem to imply an aping after the style and magnificence of a more ornate form of worship?

It seems to have been in view of such a criticism as this that Justice Harlan remarked to the Assembly that he was himself hardly pleased with the word *cathedral*, and that he would rather speak of it as a Presbyterian *minster*.

But does the word *minster* escape the ritualistic flavor of the word *cathedral*? A cathedral is properly a church which has a *cathedra*, or bishop's seat. Generally the church where the bishop has

his seat will be in a central city, and so will be larger and more sumptuous than others; but its essential characteristic is that it has a *cathedra*, or seat for the bishop. Even a small church may be a cathedral, if only the bishop makes it his seat. Now in the Presbyterian Church every pastor is a bishop, and so every Presbyterian church is a cathedral in the literal sense.

But a minster is a different thing. The word is not shortened from *minister*, but is derived from *monastery*. A minster is properly a monastery church, where the monks attend. A monastery church was likely to be a large and beautiful church, and often it was the seat also of the bishop, and so it might become a minster cathedral; but it was not the bishop, nor was it the amplitude of the building, nor the provision it gave for the common people, that made it a minster. It was a minster simply because monks worshiped in it.

Now Presbyterian audiences are not monks; a Presbyterian church is not a monastery church, a minster. It is for a plain, common minister of the same order and rank as ten thousand others, and for plain, common people, with husbands and wives and children, none of them monks. So the word *minster* does not help the matter at all; it makes it worse. You can claim that every Presbyterian church is the cathedral seat of a Presbyterian bishop, but you cannot make a monk of its bishop or monks of its worshipers.

But let us take the word *cathedral* in a very loose sense, simply as a big and grand church, superior in size and cost to any other of its denomination in the city, and what then should a Presbyterian cathedral be?

It certainly does not need to be a cathedral of the old style of architecture, built for impressive processions and ritual glory. Presbyterians, at least, want to maintain a different sort of worship. They believe in stately simplicity, in a plain, massive, Doric ritual. But they also believe in practical use. Their cathedral will not be for medieval show, but for the service of work. It must have a good audience room, as good as that of a theater, for good preaching, since preaching is the chief office of the Church. Its purpose is not to impress

people with wonder or admiration, but to teach them the beauty of goodness. So it will require room for women and for children, for teachers and scholars, for clubs and guilds, for classes and culture, for sociability and pleasure. It must be a home for those who have no home of their own. It must provide place to do things for those who need things done. It should be a center for all benevolent work, where any one that needs will find the person who will give direction or help. Some people may think of it as a hospital or a nurses' school; others as a gymnasium or an employment bureau; others as a Young Men's or a Young Women's Christian Association, with its classes in a dozen forms of useful instruction; but whatever good it can do it will seek, and for it will require room. It will not be all sermon, prayer meeting and Sunday school. It will care little for towers and stained windows and arches and columns, but much for light and love. Such a great institution may not look like the cathedral of Cologne or of Milan, but it may be the modern substitute for the old cathedral; much more useful, the thing for the twentieth century—certainly not a minster.

#### International Conciliation

The indefatigable Baron d'Estournelles de Constant, whose work for international arbitration has made France the leader in the peace movement, has now founded a new society with the object of cultivating friendship between nations by personal and unofficial methods. "*Pro patria per orbis concordiam*" is its motto. and it is based upon the idea that the best way to defend one's country is to promote peace throughout the world. Realizing that many wars arise from trivial misunderstandings or falsified reports, it will be one of the purposes of the society "*de rectifier les informations inexact ou tendancieuses propagées pour égarer l'opinion*," which, translated into American, is "to nail lies." Such an organization as this in Paris during the Spanish-American War would have been very useful. If this *Comité de Defense des Intérêts Nationaux et de Conciliation Internationale* attempts to stop all international scandal-mongering it will have enough to do carrying out the rest of its

program, which includes international visits on a large scale, the exchange of professors and pupils of the schools and colleges of different countries, the encouragement of the study of foreign languages, the establishment of an international review and a strangers' home in Paris. A very distinguished list of names heads the prospectus, among which some of the most familiar to us are Berthelot, Lombroso, Nansen, Sir Charles Lyall, Ernst Haeckel and Charles Richet in science; Paul Hervieu, Armand Sully-Prudhomme, Marcel Prevost, E. Rostand, Georg Brandés, Björnstjerne Björnson and Charles Wagner in letters, and among those prominent in the peace movement Léon Bourgeois, Duke of Marlborough, De Martens, F. Passy, Elie Ducommun and Baroness von Suttner. The American members are Andrew Carnegie, Seth Low and Nicholas Murray Butler.

**Dr. Dixon's  
Reply**

The Rev. A. C. Dixon, of Boston, made the following statement in a sermon which was printed in the papers:

"It is an open secret that when Mr. Rockefeller learned that a prominent representative of the Chicago University was tearing the Bible to pieces in a course of lectures, he ordered the lecturer to cancel his engagements and go to Europe for the purpose of purchasing a library."

In a letter to THE INDEPENDENT Professor Shailer Mathews told how Dr. Dixon had admitted that he referred to President Harper, and that when President Harper's categorical denial of the truth of the story was sent him, he refused to withdraw or make apology. We have now a long letter from Dr. Dixon in which he neither withdraws nor substantiates his charge, and therefore we do not feel obliged to publish it in full. He says:

"I received from Professor Mathews the following telegram:

'Dr. Harper denies unqualifiedly every statement in general and particular. Justice demands public correction.'

"I could not conscientiously correct the statement, for I had a chain of circumstantial evidence which would, I believe, convince a jury that it was true. So I wired in reply:

"'What I have said is true and more. Will write.'"

This promised letter Dr. Dixon sends us, with some omissions of what he calls "painful personalities," but it contains not one word, so far as given, to sustain his statement denied by President Harper. It is devoted to an attack on destructive criticism of the Bible as cultivated at Chicago. He says he is not concerned at Professor Mathews charging him with lying, for the Professor has been associated with "men of brains who have more than once intimated that the Bible has itself lied, and, finding myself in such distinguished company as Moses, Jonah and Paul, my spirits revived and I took courage." Dr. Dixon adds that he was to sail last Saturday for a month's rest in Switzerland and two months' work in London and Great Britain; and if the Chicago people want him to give the facts "concerning the general policy and inner workings of the Chicago University," they have only to make the fact known. We doubt not they would be glad to have him give his evidence as to the assertion denied by President Harper, but we presume they invite no man to open a general attack on the University. For that, however, the coast is clear and there is a free press and a yellow press.

**Professor Mitchell's  
Case**

It is a very serious condition in which the action of the bishops in the case of Prof. H. G. Mitchell puts the Methodist Church. This is the conclusion of their investigation:

"1. The evidence submitted to us is not sufficient to prove the first complaint—namely, that Professor Mitchell denies the deity of Christ.

"2. Some of the statements of Professor Mitchell concerning the historic character of the early chapters of the book of Genesis seem to us unwarranted and objectionable, and as having a tendency to invalidate the authority of other portions of the Scriptures. We therefore think there is some ground for the complaint on this head contained in the paper laid before us."

Accordingly they return his renomination to the trustees of the School of Theology in Boston University unconfirmed. Under the rule, as it appears to be understood, Professor Mitchell will cease to be a teacher there. This, we say, is

a very serious matter. Professor Mitchell's offense is that he does not teach "the historic character of the early chapters of the Book of Genesis." But who does believe them historic? Think of it, the world made in six "morning and evening" days; the man made out of clay, the woman from one of his ribs; the Lord walking about the garden in the evening; a "tree of life," and another "tree of the knowledge of good and evil"; a serpent tempting Eve; cherubim with flaming swords set to prevent man from securing immortality by eating the tree of life; Methuselah living 969 years; all the mountains under the whole heavens covered by the Flood; the ark alighting on Ararat; the confusion of tongues in fear lest men should build a tower to reach heaven—all these naïve primitive tales required to be historic! The Methodist Church cannot endure such chains. It must live, if it live at all, in the liberty of the knowledge of present day science. We do not wonder that the Methodist press seems stunned by the decision. It may be in accord with standards, but it is as absurd as the House of Lords' decision on the Free Church of Scotland; and it will equally have to be evaded somehow. As to the "tendency to invalidate other portions of the Scriptures," the Sermon on the Mount can take care of itself; it does not hang on the serpent or the ark. And equally every historical statement in the New Testament or Old must rest on credible evidence.

Professor Briggs has been to see the Pope, and is said to have had a long and free talk with him on higher criticism and the obstacles to reunion of Churches. We do not give too much credit to the report of the interview, according to which the Pope declared that one might disagree with points in Pius IX's famous Syllabus without becoming thereby a less good Catholic; but we do not question his desire to facilitate reunion. Professor Briggs has long held that reunion is not essentially impossible, and too many have

thereby got the false notion that he was likely to join the Catholic Church.

We do not see that the English people have any great reason to complain of the letter of the boy-king of Spain to the Cardinal Archbishop of Barcelona, sympathizing with the latter's request to prevent the opening of a Protestant Church in Barcelona. The King says he is "deeply pained," and that he will do all he constitutionally can to nullify the project. But this is no worse than King Edward did when he was crowned, and pledged himself by an oath to oppose the Catholic faith and worship.

An English bishop who once had a half hour's talk with the Russian Procurator Pobiedonostzeff describes him as "an exceedingly able, astute and shrewd man, but a fossilized fossil." As he withdrew they passed by a corridor set with telegraphic and telephonic apparatus connecting with all parts of the Empire, and the head of the Russian Church remarked: "There you see the pest of civilization."

"Race pride and self-respect"; "Let politics alone"—can the two go together? But so wise people talk. Is it a fit teaching for Jews or Italians or negroes or Germans? If any class of our people respect themselves will they not feel like exercising their rights equally with other citizens? To forbid politics is to forbid self-respect.

The European critics explained the long succession of American victories for the "America" Cup by the charge that it was won by non-seagoing yachts, built for racing speed and not fit to risk the ocean. So the Emperor of Germany offered a cup for a transatlantic race, and quick enough were our yachtsmen to accept the challenge and win the cup. Congratulations to the "Atlantic."

## Railway Peace Agreement

FOLLOWING the recent retirement of directors from several railway boards in which they represented the "community of interest" principle, it was announced last week that a peace agreement had been made by the Hill-Morgan (Northern Pacific and Great Northern) and the Harriman-Standard Oil (Union Pacific and Southern Pacific) interests. This agreement, it was asserted, would prevent transcontinental rate wars or any competitive invasion of disputed territory. An old dispute as to the development of the Nez Percés country in northern Idaho will be settled by the joint construction of from 300 to 500 miles of road in the district which has been the subject of controversy. It was also reported that the threatened extension of the St. Paul system to the Pacific Coast had been prevented by a traffic agreement with the two northern lines. The news had a favorable effect upon the stock market, causing an upward reaction, but the advances were not fully maintained.

## Steel Rail Pool Dissolved

It became known on the 24th that the Steel Rail Association or Pool had been dissolved. This combination, dominated by the Steel Corporation, included all the manufacturers except the Tennessee Coal & Iron Company, the Colorado Fuel & Iron Company and the Republic Steel Company. It fixed prices and allotted output, and for four years past it has required all American buyers to pay \$28 per ton at the mill. But at the same time it has permitted rails to be sold for foreign delivery at from \$19 to \$22. As more than 2,000,000 tons have been ordered for this calendar year, and the allotments have been made, it is said that the price will be maintained for several months to come. Dissolution is reported to have been caused by President Roosevelt's decision as to the purchase of Panama Canal supplies and by the Government's preparations for a searching inquiry concerning combinations in the steel trade. Similar associations controlling the prices of billets, plates, structural steel and bars are still in existence.

## Financial Items

THE longest through trolley line now in operation runs from Indianapolis to Lima, O., 188 miles. Second in length is the line from Cleveland to Toledo, 120 miles. There are 12 other interurban roads having from 50 to 80 miles of track.

....Among the stockholders of the Northern Securities Company, according to an official list recently published, are the Duke and the Duchess of Connaught, for about \$1,100,000; the Marquis of Lansdowne, \$1,300,000; the Duke of Argyll, \$30,000; Lord Elphinstone, \$1,800,000; Lord Roberts, \$37,000, and Baron Rothschild, \$3,200,000.

....J. N. Wallace, Fourth Vice-President, was last week elected President of the Central Trust Company of New York, in place of F. P. Olcott, who, owing to ill health, has resigned. Mr. Wallace is forty years old and entered the service of the company as a boy. He was made Assistant Secretary in 1898 and three years ago was elected Vice-President. The other officers of the company remain the same—namely, George Sherman, E. F. Hyde and B. G. Mitchell, Vice-Presidents, and George Bertine, Secretary. The Central Trust Company was established in 1875 and has a capital of \$1,000,000 and surplus profits of over \$14,000,000. The total resources are \$61,866,080. The members of the Executive Committee are Charles Lanier, John S. Kennedy, Cornelius N. Bliss, Adrian Iselin, Jr., A. D. Juilliard, Samuel Thorne, Jas. N. Jarvie and William A. Read.

....Dividends announced:

Am. Car & Foundry Co. (Preferred), 11-6 per cent., payable July 1st.

U. S. Leather Co. (Preferred), \$1.50 per share, payable July 1st.

Atch., Top. & S. F. Rway. Co. (Common), \$2.00 per share, payable June 1st.

Underwood Typewriter Co. (Preferred), 3 per cent., payable June 10th.

Buff. & Susq. R. R. Co. (Preferred), 1 per cent., payable June 1st.

Buff. & Susq. Iron Co., Coupon No. 6, payable June 1st.

Am. Chicle Co. (Common), 1 per cent., payable June 15th.

Chicago, Grt. West. Rway. (Debenture 4's), \$2.00 per share, payable July 15th.

Southern Pac. Co., Various Coupons, payable June 1st.

Iowa Cent. Rway. Co. (First Mort. Coupons), payable June 1st.

Minn. & St. Louis R. R. (Coupons), payable June 1st.

VOL. LVIII

NEW YORK, THURSDAY, JUNE 8, 1905

No. 2949

## Survey of the World

### Changes in the Cabinet

In accepting the resignation of Secretary Paul Morton, to take effect on July 1st, the President thanks him for "remaining so long in the Cabinet." It appears that Mr. Morton, when he became Secretary of the Navy, told the President that he could remain only a few months and would have to go on March 4th. At the President's request he consented to "round out an entire year of service." The retiring Secretary is at once to become associated in New York with Thomas F. Ryan, a prominent financier who is interested in many undertakings. Mr. Morton, probably as the head of a large corporation, will have charge of plans for the construction of a system of new subways which are to be operated in connection with existing surface lines and possibly in alliance with the Pennsylvania and New Haven railways. The city is about to provide for the construction of subways that will require an expenditure of more than \$150,000,000. Two powerful groups of financiers are competing for the control of them. Mr. Ryan, representing the surface roads, is the leader of one of these groups; the foremost figure of the other is Mr. August Belmont, representing the elevated roads and the present subway. The successor of Mr. Morton at the head of the Navy Department will be Charles Jerome Bonaparte, of Baltimore, who was employed by the Government some time ago as special counsel for the prosecution of the thieves who were found in the Post Office Department. Mr. Bonaparte (a grandson of Jerome Bonaparte, King of Westphalia, and a grand-nephew of the Emperor Na-

poleon Bonaparte) has been an intimate friend of Mr. Roosevelt for many years. He has been a conspicuous advocate of civil service reform. A Republican, his independence in politics has at times displeased Republican organization leaders in Maryland and elsewhere. By some of them he has been called a Democrat. But at last year's election he received more votes than any other man on the electoral ticket in Maryland, and therefore was the only Republican Elector chosen in that State. He was one of three Harvard overseers who opposed the granting of the degree of LL.D. to President McKinley by that university. During the recent investigation of the postal frauds he severely criticised Ex-Postmaster-General Charles Emory Smith, who had just retired from office, for permitting certain abuses that the investigation disclosed. This excited some controversy. Mr. Bonaparte has a large fortune. He is a Catholic and a near friend of Cardinal Gibbons. In 1903 he received the Laetare medal. It is said that the President intends to make him Attorney-General upon the retirement of Mr. Moody. Secretary Shaw will leave the Cabinet in February next.

### Defeat of the Ring in Philadelphia

The surrender of Philadelphia's ring to Mayor Weaver is complete. For a time there was talk of impeaching him, but the tremendous force of public opinion was recognized last week, and the Mayor was given a free hand. On the 29th, Insurance Superintendent Israel Durham, the city boss, publicly advised the Councils to confirm the Mayor's appointments, and

at the same time withdrew the application for a restraining injunction. Three days later the Councils confirmed the appointments by unanimous vote. They also sustained the Mayor's vetoes of the ring's projects for four new boulevards, one of which was to cost \$12,000,000. A resolution was introduced (and it will be passed) repealing the recent grants to the railway companies, over the Mayor's veto, of perpetual franchises in 100 miles of streets. The Mayor took measures to procure a trustworthy statement of the United Gas Improvement Company's expenditures for improvements at the gas works, with a view to reclaiming the property in 1907. At his suggestion there will be pressed in the Councils a resolution requiring the street railway companies either to place their trolley wires under ground or to give three-cent fares. He removed from office the Assistant Directors of the Departments of Public Safety and Public Works. To one of the vacancies he appointed ex-Postmaster Hicks. He also removed the Secretary of the Civil Service Board, and suspended his eligible lists, which are said to have been used for the benefit of the ring. The police have been warned to keep out of politics. One of the new officers, formerly a magistrate, says they have been worth from 50,000 to 75,000 votes, mostly fraudulent, in the elections. The lists were padded with the fictitious names of persons alleged to reside at policemen's dwelling houses. Among the declared purposes of the Committee of Seventy are the purging of the lists, legislation for personal registration and the repeal of the "ripper" act recently passed at Harrisburg. In his curious message approving this act (which transferred from the Mayor to the Councils, next year, the appointment of the Directors of Public Safety and Public Works) Governor Pennypacker admitted that he had been guided by the advice of Boss Durham. It has repeatedly been asserted in the press, and was widely believed, that in recognition of his services in behalf of the "ripper," Governor Pennypacker was to be nominated (and elected) to

the Supreme Court to succeed the late Justice Dean. But this project has now been abandoned, owing to the indignant protests of the people and the press of both parties. There is still one newspaper in Philadelphia that calls for this nomination. It is the lonely paper that continues to laud Durham as "the peerless leader," commends his "splendid courage and diplomacy" (in withdrawing the gas lease), and characterizes all the other papers as "yellow journals" that are responsible for the city's loss of "a great business advantage." Ex-Attorney-General Wayne MacVeagh has been retained by the Committee of Nine to inquire as to the street railway franchises. The Mayor says that he hopes to save \$1,000,000 a year by abolishing sinecure offices. Among those who deserted Durham and came over to the Mayor are the Vare brothers, who hold public offices, have the street cleaning contract and control all the Councilmen in the southern part of the city. Followers of Durham have suffered heavy losses by reason of the fall in the market price of United Gas Improvement shares, in which they had made large speculative investments. At about the time when the lease was approved the price rose to \$125, but it has since fallen to \$92. This was disastrous to many who had expected an advance to \$150, and several well-known politicians have lost their entire fortunes. The Mayor is to have an advisory council of prominent citizens. It is pointed out that by birth he is an Englishman. Durham and his lieutenants were in absolute control of the city government and had the support of Senator Penrose and the State "machine." Some think their fall may wreck the State organization built up by the late Senator Quay.

#### **Eight-Hour Law for Canal Laborers**

It became known last week that the Government, because of an opinion given by Attorney-General Moody, would enforce the eight-hour law in canal work on the Isthmus. A cablegram from Governor Magoon said that the Commission's Executive Committee had formally re-

solved upon an eight-hour day for all laborers and mechanics after June 1st. Secretary Taft explained that this followed Mr. Moody's opinion, which was that the eight-hour law must apply because the work of canal construction was to be done by Government labor. But the Commission's clerical force is excepted and also the Panama railroad employees, because the railroad company is a private corporation, altho the Government owns all the stock. It will now be necessary to readjust, upon an eight-hour basis, the contracts for coolie labor. The Secretary has asked Chief Engineer Wallace to prepare for Congress an estimate of the additional cost. According to statements published by him some months ago, the application of the eight-hour law will largely increase the cost of excavation and add a year or two to the time heretofore estimated for the completion of the work.—The appointment of Facundo Duran, formerly Governor of Panama, to be Chief Justice of the Supreme Court of the Canal Zone, has given great satisfaction in the republic.—Richard L. Farnham, a director of the Panama Railroad Company, is visiting the British shipyards in search of suitable ships to be chartered by the Commission in accord with the purpose recently announced by Mr. Roosevelt.—One of the superintendents employed by the Commission at the Culebra cut asserts that he has discovered not far from the canal route a very large deposit of good coal.

**Memorial Day Addresses** Mr. Roosevelt was in Brooklyn for five hours on Memorial Day, having come from Washington to make an address at the unveiling of a statue of Major-General Henry W. Slocum, who served with distinction throughout the Civil War and was a member of Congress for several years thereafter. In his address the President spoke of General Slocum's career and referred to his own recent experience in the Southwest as evidence of the reconciliation of the blue and the gray. In the parades with which he was greeted in Texas he had seen representatives of

the Grand Army marching by the side of Confederate veterans or intermingled with them. His familiar views on international relations were again set forth. After a warning against "a habit of speaking loosely about foreign Powers and foreign races," he said:

"The surest way for a nation to invite disaster is to be opulent, aggressive and unarmed. Now, we are opulent, and I hope we shall remain so. I trust that we shall never be aggressive unless aggression is not merely justified, but demanded. Demanded either by our own self-respect or by the interests of mankind; and, finally, remember that to be aggressive, above all to be aggressive in speech, and not to be armed, invites not merely disaster, but the contempt of mankind. If our navy is good enough, we have a long career of peace before us, and it is only likely to be broken if we let our navy become too small and inefficient. A first-class navy, first-class in point of size, in efficiency both in units and in combination of units, is the best and cheapest guaranty of peace. I should think that any man looking at what has happened and what is happening abroad, and in our own history in the past few years, must be blind if he cannot read that lesson clearly."

Before starting for Washington, the President visited the building erected by Miss Helen Gould for the Naval Branch of the Y. M. C. A., and spoke there again of the navy.—At the tomb of General Grant, the Rev. Dr. McConnell, of Brooklyn, said that we should make up our minds that the South was "just as much convinced of the righteousness of her cause as we were of ours." He did not believe that the Confederate flag should be put out of sight. "It should be respected as long as men revere personal bravery, the genius of leadership and the courage that follows conviction, if need be, to the grave." In a brief address, Captain Graybill, a Confederate veteran, predicted that eventually there would be one day for the decoration of the graves of both the blue and the gray.

**Portland's Centennial Exposition** The Lewis and Clark Centennial Exposition at

Portland, Ore., was formally opened on the 1st, which had been made a legal holiday in Oregon, Washington and Idaho. Vice-President Fairbanks led

the parade from the heart of the city to the Exposition grounds, and was the chief speaker in the exercises which followed. In the course of his address he said:

"We must have a vigilant care for our increasing interests in the Orient. If we would have the trade of the peoples of the Far East we must first have their confidence. Moreover, we must suit our commodities to the needs of those with whom we would traffic. The tragic events which are transpiring in the Orient are deeply deplored by every lover of peace and humanity the world over. The mighty and bloody conflict had its inception in a desire for commercial conquest. The American people were not indifferent to their own interests, and early in the struggle made sure of the preservation of their commercial advantages in the very theater of war. Our trade interests are to be pushed in that far-off country not by the instruments of battle, but through the potent agencies of peace. We are destined to play a more important part than heretofore in the commerce in and beyond the Pacific. We must not underrate the commercial opportunities which invite us to the Orient."

But we should be careful, he added, not to jeopardize our home market while seeking uncertain markets abroad. After this address, the machinery of the Exposition was set in motion by President Roosevelt. Standing in the White House, surrounded by a large party of invited guests, he touched a telegraphic key by which the necessary connection was instantly made. In Portland, the cathedral chimes in the Government Building rang out, the bands began to play and the artillery thundered a centennial salute of one hundred guns.

#### Chicago's Street Railways

Mayor Dunne is considering a proposition submitted by the street railway companies. It is not wholly satisfactory, but may become the basis of an agreement. The proposition is substantially as follows: That the companies' roads be turned over to the city at once, to be operated by the municipality or by the companies, with representatives of the city in their boards of directors; that the lines be rebuilt and newly equipped by the companies upon plans agreed upon by the two interests, the cost of this work to be added hereafter

to the appraised value of the tangible property in its present condition; that the appraisal be deferred until the end of all litigation as to the companies' franchise claims; that Mueller certificates shall be accepted by the companies in payment, if pronounced valid by the Supreme Court. —Judge Grosscup has refused to continue the temporary injunction obtained by the companies to restrain the city from taking further steps toward municipal operation until a final decision as to the 99-year franchises. Therefore the city is free to oust the companies from streets where, by recent decisions, the franchises have expired.

#### In the Philippines

Owing to an insurrection in Samar, sixteen companies of infantry have been sent to that island for a campaign under General Carter. The uprising is not against American rule, but was caused by the corrupt practices of native officials and hemp buyers who defrauded the people. General Carter has removed the offending officers. In Luzon, Ramos, leader of the ladrones or outlaws of Cavité province, has surrendered. He and his followers are said to have been living on the plantation of Roxas, a millionaire Filipino who was recently arrested.

#### An Attempt to Kill King Alfonso

The King of Spain on his visit to France and England reached Paris May 30th and was lodged in the Palais d'Orsay. In the evening a dinner was given in his honor by President Loubet at the Elysée. On the following evening as he was returning through the Rue de Rivoli from a gala performance at the Opera with President Loubet an anarchist threw a bomb at the royal carriage. It struck the shoulder of one of the cuirassier guards and fell to the ground and exploded, killing his horse and throwing fragments against the carriage. The guardsman, a policeman and a woman standing near were slightly injured. The nineteen-year-old King manifested great presence of mind in the emergency. He immediately rose to his feet and made a bow to the people to assure them of his safety, and expressed

the hope that the President would not be worried by the incident. Three young men in the group from which the bomb was thrown and several Spanish anarchists have been arrested, but the would-be assassin is not yet identified. It is supposed that the plot was arranged by the Barcelona anarchists. The bearing of the King throughout his visit made an excellent impression upon the people and he was received with cheers wherever he went. In the Bois de Boulogne he watched balloon experiments and automobile races, and at the military review at Chalons he took command of the Fifth Cavalry Division and with drawn sword led a charge of 4,000 French horsemen for over a mile. On June 5th he departed for London.

#### The Effect on Russia

The reports of the destruction of the Russian fleet were withheld from the people as long as possible, but when the extent of the disaster was realized there was a storm of denunciation of the admirals for cowardice and the bureaucracy for incompetence. With a few exceptions all the newspapers call for peace and a national assembly. But the Czar is said to have declared that he would die rather than sign a treaty of peace, and it is again announced that Russia will consent to talk of peace only after winning a victory. The Imperial family and the Ministers have been in consultation at the Tsarkoe-Selo palace. The Grand Duke Vladimir, uncle of the Czar, remained for this conference, and the Grand Duke Michael went in his stead to Berlin to attend the marriage of Crown Prince Frederick William. On June 4th the determination of the Czar to resist all attempts to force the Government was evinced by a ukase granting to Governor-General Trepoff extraordinary powers over the whole empire for the suppression of political agitation. He was made Assistant Minister of the Interior, Chief of the Department of Police and Commander of the Gendarmerie, and is empowered to close all assemblies and congresses, to suspend indefinitely all leagues, societies and other bodies manifesting pernicious activity, and to take any other steps necessary to prevent interference with the existing

*régime*. General Trepoff is one of the most determined and merciless of Russian officials. He attained distinction by the severity with which he put down the student riots in Moscow when Chief of Police there, and when the riots in St. Petersburg got beyond control he was called there to become Governor-General of the city, with almost dictatorial powers. The fact that Count Cassini, the Russian Ambassador to this country, and the Japanese Minister, Kogoro Takahira, have both had interviews with President Roosevelt during the week has caused it to be surmised that our Government may act as mediator between the two belligerent Powers. The Czar some time ago promised to call a zemsky sobor or some form of advisory council and this is likely to be called soon to throw upon it some of the responsibility for an ignominious peace.

#### The Battle of the Sea of Japan

There was much speculation in the outside world as to what Admiral Rojestvensky would do when he reached the Pacific. Would he try to dodge the enemy's fleet or seek it? Would he bombard Japanese cities or make a wide detour around Japan in the attempt to reach Vladivostok? But the man who most needed to know where Rojestvensky would go, knew. Admiral Togo had long been watching the Strait of Korea as a cat watches a mouse hole. His whole fleet was concentrated at that mysterious point always referred to in the Japanese dispatches during the war as "the naval base," or "our rendezvous," probably the harbor of Masampo. As the fog lifted at five o'clock on the morning of May 27th the Russian fleet was discovered steaming northeast into the Korean Strait and the news was conveyed to Togo's flagship by wireless telegraphy. The Japanese fleet prepared for action and took a position near Tsu Island (Tsushima) in the middle of the Strait, waiting to see which channel the Russians would take. A little before noon the scouting vessels telegraphed that the enemy was coming up the Eastern channel; accordingly the Japanese fleet moved southward and deployed across the

channel, between the islands of Tsu and Okino. From the "Mikasa" came a signal from Admiral Togo almost in the words of Nelson just a hundred years ago:

"The destiny of our empire depends upon this action. You are all expected to do your utmost."

The Russian squadron advanced in two columns, the eight battleships on the side toward Japan, the four cruisers on the left and behind them the special ships and torpedo boat destroyers, 32 vessels in all. The "Kniaz Suvaroff," at the head of the line, fired the first shot, at 2.13 p. m., and after a few minutes the "Mikasa" replied. As the Russian column advanced the Japanese ships fell into line, paralleling it on the west and crowding the Russians toward the coast of Japan. While the first and second divisions attacked the head and flank of the Russian column, the third division slipped around to the rear. Thus surrounded and under fire from all sides the Russian fleet remained until the next day. After two hours' fighting it became completely disorganized, and the Japanese closed in and concentrated their fire on the individual vessels in turn. The battleship "Sissoi Veliky" was the first to sink. The "Borodino" was attacked on all sides by five Japanese warships, which poured upon her a hail of heavy projectiles. Her 12-inch guns were put out of action, the decks and barbettes filled with dead and wounded men and the steering gear and ammunition hoists disabled. Toward evening a torpedo flotilla approached within 200 yards of her to give the finishing stroke. One of the torpedo boats was sunk by a shell, another missed, a third blew up the vessel, which turned turtle. Only 40 men of its 750 were picked up from the water by the Japanese. Admiral Rojestvensky remained on the flying bridge of the "Borodino" until he was wounded; then he was taken on board the destroyer "Bedovy," which was overtaken near the Korean coast by a Japanese vessel and raised the white flag and the Red Cross. The Admiral was taken to the hospital at Sasebo, Japan, where he received a visit of re-

spect and sympathy from Admiral Togo. During Saturday night the Japanese continued their torpedo attacks, sinking many of the Russian ships, while others took advantage of the darkness to escape. Rear-Admiral Enquist, in charge of the heavy cruiser squadron, took the three cruisers, the "Oleg," the "Aurora" and the "Jemtchug," to Manila, where they arrived June 3. Secretary Taft has telegraphed Governor-General Wright that

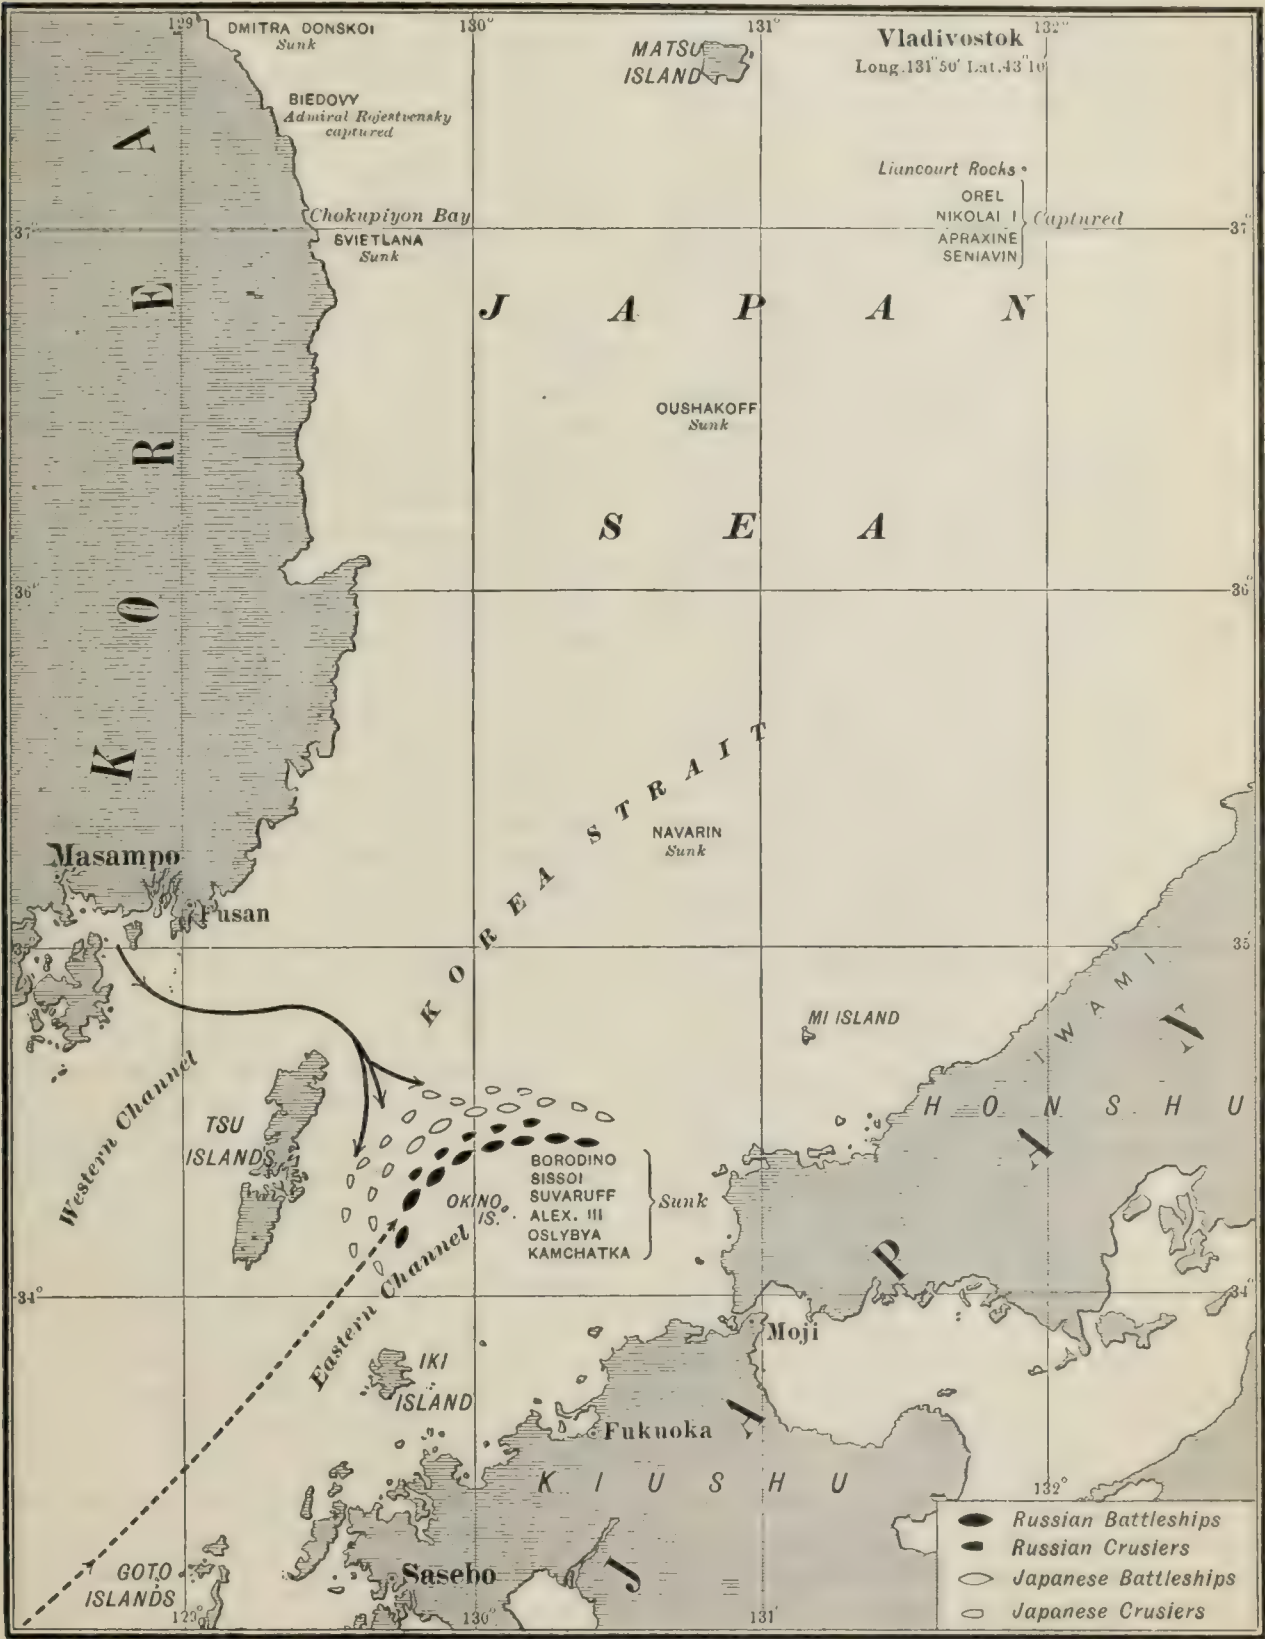

"Time cannot be given for the repair of the injuries received in battle. Therefore the vessels cannot be repaired unless interned until the end of hostilities."

Admiral Nebogatoff, with five ships, made a dash to the north for Vladivostok, but was overtaken by the Japanese in the morning near Liancourt Island. One of the vessels, the "Izumrud," escaped and nearly succeeded in reaching Vladivostok, but ran on a reef in the night of May 29th at the entrance of Vladimir Bay. The commander, Baron Ferzen, landed his crew and blew up the cruiser. The other four Russian ships surrounded at Liancourt Island—the battleships "Nikolai I" and "Orel" and the coast defense ships "Admiral Apraxine" and "Admiral Seniavin"—were surrendered by Admiral Nebogatoff. The cruiser "Almaz" and three destroyers reached Vladivostok. With the exception of these and the three cruisers in Manila Bay every vessel of the Russian fleet in the Sea of Japan was sunk or captured. Three thousand Russians were taken prisoners, and it is estimated that some 5,000 more must have perished. The Japanese loss was 113 killed and 424 wounded. Rear-Admiral Voelkersham, in command of the battleship squadron of the Russian fleet, was killed at the beginning of the fight by a shell striking the conning tower of his flagship, the "Oslybya." The completeness of the disaster to the Russian fleet is laid to the incompetence of the commanders, to poor marksmanship and deficiency of ammunition, to mutinous crews and to lack of knowledge of the enemy's position. Admiral Rojestvensky is said to have thought that the Korean Strait was

guarded by only a small part of the Japanese fleet. He seems to have been unprepared for the attack, and the Russian fleet was at the beginning thrown into confusion from which it never rallied. The action of Admiral Nebogattoff in surrendering four ships instead

of fighting to the last or scuttling them, and of Admiral Enquist in deserting the rest of the fleet in the midst of the battle, is severely criticised, and these officers would be liable to punishment for cowardice if they returned to Russia.

Map Showing the Position of the Fleets in the Early Part of the Battle of the Sea of Japan and the Fate of the Russian Vessels. The Armored Cruisers "Admiral Nakhimoff" and "Vladimir Monomach" Were Sunk Near Tsu Island

# What Togo's Victory Means to Us

BY PARK BENJAMIN

I. The first thing that strikes one, in reviewing Admiral Togo's magnificent victory, is its strict accord with the well-known insistence of Japan that her ships shall fight near her own coast.

Therefore she put Togo with his fleet in the shortest highway to Vladivostok and so near to her own bordering shores that even a desperately wounded vessel might be able to limp into some one of her many havens and dockyards—and then leaving invitingly open the main road, quietly awaited her adversary's arrival.

Into the trap bravely steamed Rojestvensky's ships, foul with weeds, short of coal, and anxious to reach the northern shelter. The Japanese, with merciless precision, closed in around them with a ring of steel and fire, every attempt to break through which was met by the torpedo boats, and then as darkness fell came the rush of the destroyers. The rest of it was the gradual extermination of the survivors as fast as they were caught in their flight, and so the proud Baltic fleet of Russia ended its long journey in annihilation.

One of the strongest parts of our Navy is the Atlantic Ocean; another is the Pacific. Hostile fleets to attack us must cross them. Clearly it is better to do our sea fighting at home—as Togo did. That also makes for a smaller Navy, since two fleets, one to go off on excursions and the other to defend the coast, will not be needed.

II. Japan at once achieves a great advance as a naval Power, while Russia, on the other hand, is now almost as negligible as was Spain at the close of the recent war. The difference in her favor lies in her superior resources. To rebuild her navy will be the work of years, but the replacing of ships alone can never insure an efficient navy. That is only to be obtained through efficient men, and the lack of these is the direct cause of Russia's de-

feat. A battleship can be built in 40 months, but it takes 72 months to render a man, otherwise qualified, fit for the lowest naval rank, and nearly 20 years to educate a competent naval commander. These are the periods required, observe, when the raw material comes from a stock bred to the sea and when training is conducted under the traditions and discipline of the natural sailor races. To these the Russians do not belong, nor have they ever followed the Anglo-Saxons in sea discipline and traditions. It is reported that the crew of one of their sunken battleships was drafted from an artillery regiment and that some of the officers were cavalrymen. This may not be true, but it would be nothing surprising if it were, since Russia has always mixed her land and naval forces. England, in Charles II's time, had sailors to handle her ships and soldiers to fight her guns, but the separation was clear. The sea is a jealous mistress, and while she permits the sailor sometimes to do the work of a soldier, she never submits to the control of the soldier only. It is a new navy of men that Russia will have to raise up; not merely a navy of ships.

The net result of Japan's achievement is to reduce the Russian navy from third to seventh place among the navies of the world, and to advance the Japanese navy to sixth place, so that the Powers (arranged in order of tonnage) now rank as follows: Great Britain, France, Germany, United States, Italy, Japan, Russia, Austria. As every foreign nation is to be reckoned as a possible enemy an increase in our present Pacific fleet is indicated, unless, of course, we follow Japan's policy in limiting our sea fighting to our own waters, in which case it is not apparent how any hostile meeting between Japan's navy and ours could ever occur.

III. One clear result is the unsettlement of the whole battleship question. The first brilliant attack made by the

Japanese torpedo boats at Port Arthur temporarily silenced the extreme advocates of the battleship; but because the subsequent torpedo work did not continue to be spectacular they took heart of grace and for some time past have been vociferous. They will now probably do some hard thinking.

In an article in *Collier's Weekly*, published a month ago, Captain Mahan says:

"While open, I hope, to conviction, and despite the impressive potentialities of the torpedo vessel, I believe in its essential inferiority if resolutely met,"

meaning by "resolutely met" if such vessels do not produce a panic akin to that caused in by-gone years by fire-ships. He adds:

"I should certainly expect the Japanese admiral to withhold his armored vessels of every kind till he has fully tested the possibilities of his torpedoes";

and then he conceives: "Should unsuccessful compel him," Togo would "bring the armored force into play against the undiminished Russian fleet."

The obvious inference is that Captain Mahan deems torpedo attack well enough to try at the outset, but hardly comparable in certainty of finally destructive result with the gun fire of heavy vessels. Yet the accounts so far received of the great fight reveal much difference of opinion between Admiral Togo and Captain Mahan. The attack appears to have begun with tremendous gun fire from the Japanese. An eye-witness of the engagement says that "by the unusual gun fire of the Japanese the Russian vessels were thrown into utter confusion. The Japanese knew instantly the enemy was beaten and the concentrated fire now became absolutely infernal." The torpedo boats appear at the outset to have been used to prevent the hemmed in Russian ships from breaking through the cordon of Japanese vessels, while the gun fire was kept up at constantly decreasing range, and concentrated at times first on one Russian and then on another with systematic deliberation. When a victim showed clear signs of distress two or three torpedo boats would come in to deliver the *coup de grâce*. After nightfall, however, the

main torpedo assault was delivered, and the result was the sinking of the "Oslabya," "Alexander III," "Navarin" and three gunboats.

Plainly Admiral Togo was very far from regarding the torpedo attack as an expedient to be tried out in the beginning. On the contrary, he used it in conjunction with, and as a supplement to, gun fire, and it seems that most of the ships which were sunk succumbed to it. Again has been proved the vulnerability of the huge battleship. Again it has been proved that the most complicated aggregation of mechanism that the human mind has ever produced can certainly be sent to the bottom by a few score pounds of explosive detonated against her under-water hull.

Another fact to be noted is that the heavy superstructures of the battleships did not prevent wholesale slaughter of their crews and prompt destruction of ammunition hoists and other vital mechanisms. The men who escaped from the "Borodino" liken her decks to shambles, and yet here was a vessel in which the crew were mainly disposed in no less than eight separate armored turrets. Conceive the frightful slaughter which would occur in such vessels as our "Kearsarge" or "Kentucky," where most of the crew is massed in a single huge, weakly protected compartment. It may well now be doubted whether any construction could be devised more certain to sacrifice life than this. The surest and largest battue of game is got when the animals are driven into a crowded enclosure. And all past experience of naval actions proves that bodies of men can seldom withstand the killing of thirty per cent. of their numbers without demoralization and surrender. Surely it is time to heed the logic of events and seriously consider whether ships which cost over five millions each, but which can be turned into slaughter houses above water, and which a couple of hundred pounds of gun cotton below water can send plunging to the bottom, are after all the best sea weapons which the ingenuity of the most ingenious people on earth can devise.

And, finally, this great action was won, not by a huge fleet of battleships, but by four, supplemented by eight armored

cruisers. No stronger evidence could be adduced in favor of the contention that what we need is not a vast battleship force capable of overwhelming that of any foreign nation by mere numbers, but an adequate fleet, far smaller but of the highest possible efficiency in both material and men.

IV. And "prophetic strategy," that singular mystery so called, which has grown up, mainly in the magazines, during the last few years, certainly has received a savage blow. It is needless to summarize the various speculations and predictions of all the magazine strategists, since none of them came true; but perhaps the plight in which the particular strategy as expounded by "the chief authority in the world on the science of naval warfare" (I quote the designation from *Collier's Weekly* of May 13th last) now seems to be of some public concern. We are informed in the above-named periodical that

"a just sense of the greater and terrible dangers of advancing toward Vladivostok by the Formosa and Tsushima straits will probably induce the Russians to follow the alternative route suggested (to pass by the southern channel of those between Luzon and Formosa by daylight), and thence to make a somewhat wide sweep to the eastward of the Japanese Islands":

That Kelung on the north coast of Formosa is the "point at which we may guess, and if successful may congratulate our wisdom that Admiral Togo is; or that upon it he depends largely for utilizing the positional advantages of Formosa. These are a certainty beyond guessing;" that even if the Russians should go east or west of Formosa, "to whittle away our enemy's force . . . is indisputably good management" and "is still more incumbent when, as in this supposed case, the disparity is not irreversible" or, in other words, that a "plan of harassment by tactical management" should be expected. And the final deduction is that Togo

"may try by rapid movements to 'outmaneuver the Russian,' thereby either effecting a preliminary reduction of force, or creating an opportunity 'to close' at advantage; or he may, under such dispositions as may seem to him most suitable, close at once, throwing everything on the hazard of the die. The last

is the easier course for the admiral, as it is the most imposing; but for the same reason that it is easier *it is not suited to the circumstances of Japan*. It is easier because, the battle once joined, there is left to the admiral little further responsibility till the outcome is settled; but it abandons all to the chances of a *mêlée*. If the Japanese fleet possesses adequate maneuvering power its superiority in numbers and the inferiority of most of its units to several of the single vessels of the enemy appear to me *to require that it exhaust all the possibilities extended to it by inferiority of speed and the facility for combination due to numbers before exposing to final trial the corner-stone upon which rests the near future of the country*" (my italics).

Now, in the face of this, to find Togo calmly waiting *not* at Kelung, but in the Korean Strait, eight hundred miles distant; to find Rojestvensky *not* going through the southern channel and *not* making any extended detour, but after traversing the northern channel, moving directly into the strait of Tsushima, "the very heart of Japanese naval stations and facilities of every character;" to find Togo indulging in no plan of initial harassment or "whittling" operation, but attacking his antagonist like a bull-dog, despite "the unsuitability of that mode of offense to the circumstances of Japan;" to discover no evidence of *mêlée* at all, but on the one hand Russian confusion and on the other what was practically deliberate target practice at steadily decreasing ranges by the Japanese; to discover also that the "corner-stone" was calmly exposed to final trial not only without the least apparent regard to "exhaustion of possibilities of torpedo attack," but coincidentally with torpedo attack and before the main torpedo assault—all this, to say the least, must be disconcerting to those who, despite the "ifs" and "may be's" guarding it, pinned their faith to the strategic forecast.

This is not to decry the value of that astute grasping, as if by inspiration, of the true elements of time and place which always signalizes the great commander in the field and which enables him to gain an advantage which, as Francis Drake said, "in all nautical actions is half the victory." The best strategy is the strategy that wins. Togo has shown us what that is, and his Emperor has specifically thanked him and

the navy for what he has done "with the best strategy." It is to suggest that when the prophetic strategy of the study comes to be exemplified by the present forecast (made by the "foremost living strategist" concerning the greatest naval action of modern times) there is need of much circumspection in depending upon it hereafter.

V. The certainty and precision of their battle tactics show how completely the Japanese had reached that ready condition to which Dean Merivale nearly half a century ago, in his "History of the Romans," gave the name of "preparedness for war." That the phrase means ships and men adequate to any probable emergency goes without saying, but this is not all it signifies. It also includes the development of adequate sources of supply. It is necessary only to point to the marvelously rapid increase in the Japanese manufactories indicated by their now undertaking the construction of a battleship of the largest size, 19,000 tons, to see with what activity this development is being pushed.

It is true that our powers that be are advocating more battleships, which involve the assembling of the results of already developed resources; but it is not so plain that the further development of the resources themselves have been fostered to an extent in anywise sufficient to meet possible emergencies. The curious notion seems to have prevailed that the Navy is a manufacturing establishment which can make guns and conduct all the experiments to meet the constant demand for improvement of them, and also ammunition with its improvements, and it has even been seriously proposed that it should make armor also. Yet with all the facilities now existing in this country it is extremely doubtful whether we can produce any adequate supply of ammunition. Look at the blowing off of muzzles which still continues because we persist in keeping afloat guns designed for brown powder pressures long after brown powder has become obsolete and replaced by smokeless compounds. It is a private concern which is making at its own cost the experiments looking to betterments in our weak weapons. There are not wanting critics to contrast the expenditure of ten millions for buildings at Annapolis with the reluctance to give

to American gun makers the contracts to devise and make better arms than we have.

Nearly fifty years ago one of our naval officers, Commander James H. Ward, a brilliant scholar and one of the first to die at his post in action during the Civil War, pointed out that

"It is idle, as it is unreasonable, to look in a Continental nation, as the United States, for the living perpetual interest and favor with which an insular people, like those of Great Britain, cherish their wooden-walled defenses and patiently endure the burdens they entail. *But such a degree of experimental construction as will determine the best types is judicious; because with men, money and material at command it renders the problem of sudden and indefinite increase in the number of ships of easy and safe solution in the event of war. And . . . it is in reality resources for building, equipping and manning ships, in which England vastly excels, that gives to her, or to any nation possessing them in the greatest degree, a true and actual maritime ascendancy.*"

It is especially reassuring to learn almost coincidentally with Togo's victory that the Navy Department for the first time in many years is ready now to buy navy guns from private makers in this country, and that both the Bethlehem Steel Company and the Midvale Steel Company have submitted bids for a large part of the armament of the battleship "New Hampshire" and the armored cruisers "Montana" and "South Carolina." We cannot afford to continue below the standard of naval preparedness which Japan has exhibited. The encouragement of our own manufacturers seems the best way to reach and maintain it.

VI. The dash and vigor of the Japanese attack would, of itself, indicate that the fight was won by young men, even if their presence were not already well known. The average age of the Japanese commanding officers is between forty and forty-four years. All the Japanese rear-admirals are less than fifty years of age. Togo himself is forty-eight. The men who handled the smaller vessels and torpedo boats are much younger. Our Navy is officered by old men, too old to be of any use in war. Our youngest rear-admiral is older than Togo. The average age of our captains is thirteen years beyond that of the Japa-

nese captains. Our youngest captain, if in the Japanese Navy, would long since have been superannuated. All of our captains are fifty-five years and over. We are not properly educating the younger men because we are giving to these old men the experience in command. The first thing that we should do in the event of war would be to relieve them and put the young men in their places. In the great fleet which we have already collected a battleship is commanded by a captain over sixty-one years of age, who has less than a year to serve before he is retired by law. His past service record has been excellent, but what is the use of further educating him? While in most professions a man at sixty-one is far from being worn out, this is not true of the naval career and less true than ever now, when the strain upon physical endurance is greater than ever. The law which superannuates a naval officer at the age of sixty-two was recognized as a wise one in the days of wooden frigates; it is still wiser now, when the advance in ships and guns since it was enacted has been greater than during all the centuries which had previously elapsed since the "world's debate" at Actium.

It is bad enough not to be training commanders of vessels, but worse not to be training admirals; for to command a fleet or a squadron requires capabilities widely different from those which the commander of a single ship must have. It is not true that a good captain necessarily makes a good admiral. The only way to find out whether he will or not is to try him. The present Admiral of the British Mediterranean fleet, Lord Charles Beresford, who by the way has already successively commanded five squadrons, has a unique way of doing this. Any one of his captains during fleet drill, and generally when he least expects it, may be suddenly made admiral *pro tem.* by signal from the flagship and ordered to take instant charge of the maneuvers. It is staggering, but highly beneficial in sifting out the unready.

The Navy Department acknowledged before the country the other day that we had but one Admiral fit (by reason of age and length of time to serve) to take command of the present fleet. Rear-

Admiral Evans was selected for that position because he does not retire until 1908. Of the twenty senior captains who will become admirals within the next two or three years, but four have any longer time to serve than Rear-Admiral Evans, and none of these can serve longer than five years.

Drastic as it is, there seems to be but one plain course to pursue, and that is to remove at once from the active list of the navy every officer of command rank who is over fifty years of age and promote their juniors to their places. Even then the admirals and captains will have had more than a quarter of a century's service. There is no lesson of the recent great battle which is plainer than this. If the next war must find us with incompetent men in the navy it is better that they should be filling vacancies in the lower grades than among the commanders, who directly hold in their keeping the honor and safety of the nation.

VII. Not only has the importance of secrecy in military operations been demonstrated by the Japanese, but they have proved beyond question that it can be maintained. They lost the "Yashima," one of the best of their five battleships, by a mine explosion over a year ago. Altho the loss was suspected, it never was certainly known until now, when Togo's victory rendered further concealment needless. More extraordinary still has been their success in preventing any knowledge of the whereabouts of Togo's fleet. There was probably no information more eagerly sought for by the press of the entire world; and it is certain that to any one able to give it, a price would have been paid which might well seem a fortune in itself. Yet out of the thousands of Japanese who could have said where that fleet was, out of the unknown number who must have been tempted with the magnitude of the possible reward, *not one told.* Japan can well be proud of her victory, but she can be even prouder of the unswerving fidelity of her people.

It may now be concluded that correspondents will not hereafter be lodged on our flagships and that press boats will no longer be permitted to follow the fleet.

## Togo, the Silent

BY ADACHI KINNOSUKE

THE shades of night were falling upon the Yellow Sea, upon Port Arthur and upon a certain place hid in the emerald bosom of the Elliot Islands. You could see a number of Nippon officers from the "Asama," the "Shikishima" and their sisters making for the flagship, the "Mikasa." It was the nineteenth of February, 1904. They were gathering upon the "Mikasa," those officers from different ships of the

United Squadrons, in answer to the invitation sent by Admiral Togo and Vice-Admiral Kamimura. And the hour was a little after six. They were the men, those officers, who had been selected to take the doomed and coal-laden old hulls to the mouth of the harbor of Port Arthur, to sacrifice them to encourage quiet among the restless Russian warships within the harbor. It was the farewell feast. The two admirals, who loved

Admiral Togo and His Two Sons. Copyright, 1905, H. C. White Co., N. Y.

them much better than so many fathers love the children of their own blood, were about to send these officers across the bourne from which no soldier either wished or dreamed to return. After the ancient rite of the samurai, they wished to bid good-bye to these, their good men, in a cup filled with pure, cold water. It was one of those farewell feasts, common enough in the braver days of the castle and of the sword, in which the living bade farewell to the living—to their own life.

Admiral Togo, a cup in hand, rose; as of wont, the gentle smile upon his placid features was as the lotus blossoms upon the veranda of our Lord Buddha. As usual, for many minutes he was without words. The eyes all about the table, at once moist and afire, hung upon the modest figure of the Admiral. At last the Admiral opened his lips: "*Sakan-narukana!*" he said, his lips quivering. As you cannot translate in black and white the eternal grandeur of Mount Fuji, it is quite impossible for a mortal to translate that one single word with which the Admiral toasted the splendor of the heroic and desperate undertaking of his men.

"This single word," remarked one of the officers present, in a later day, "this single word of the Admiral, pronounced with the gentlest of tones, fell upon us like the cloven tongues of fire of Biblical memory. There was a young officer seated beside me. Turning to me he said: 'That toast of the Admiral makes me feel as if some one has suddenly pickled my soul in red pepper.'"

This is not the only occasion when the Admiral made clear how the eloquence of silence passes the understandings and cunning of human words.

On the historic fifth of February of last year the officers of the United Squadrons of Nippon, then at anchor in the dreamy peace of the harbor of Saseho, saw upon the halyard of the "*Mikasa*" a string of bunting. The signal called them to the flagship and into the presence of their Commander-in-Chief. When they gathered together in answer to the command on the aft deck of the "*Mikasa*," there was only one thing they could see. It was a very small thing; a weak girl could carry it

with perfect ease in her hand. It was striking, nevertheless. Standing upon an elevation, in a white and sharp contrast against the details of the most modern of fighting machinery of the battleship, was a sambo. And a sambo is a white wood tray, unvarnished and without a touch of lacquer and entirely innocent of ornamentation, made of *kiri* (*paulownia imperialis*), and which is used exclusively for sacred purposes; offerings to the gods are placed upon it; in the braver days of the samurai it was upon this white tray that a dagger was placed—that traditional three-and-half-inch with which a samurai used to perform the rite of the *kappuku* (vulgarly called *hara kiri*). And on that historic morning aboard the "*Mikasa*," in this dawn of the twentieth century, the officers of the Nippon navy saw the sambo and upon it a dagger. The Admiral came upon the scene. With his gentle face, made the more kindly with the ripened wisdom and experiences of fifty years, he faced the officers in whose hands his countrymen have placed the honor of the sun-disk flag on the sea. The Admiral was there to tell his men what was expected of him. He did not say: "Nippon expects every man to do his duty"—not even "honor or death." And this latter, in all decency, is perhaps as short a thing as he could well say. When you think of it a little, his economy in words is appalling. Simply and steadily as minutes passed over the silence of the gathered officers of his fleet the Admiral fixed his eyes upon the white wood tray and the sacred old-time symbol of samurai honor upon it. The eyes of the officers were also upon "the three-and-half-inch" upon the sambo. The Admiral said nothing; in sooth, what was the use of saying anything? Their forefathers in the castle days of Nippon knew one and only one method of apology when they happened to fail in the discharge of duty, in the accomplishment of a work for the State and for the Prince: they committed *kappuku* with "the three-and-half-inch," such as these officers of the twentieth century Nippon saw before them aboard the "*Mikasa*." And so it came to pass that Admiral Togo wrote the wordless preface to the Russo-Nippon War.

And this is not the only war to which he wrote a silent poem. Ten years ago, when autumn was dreaming in the sky and upon the seas off the littoral of Korea, he stood upon the bridge of the "Naniwa." He was her commander then. To scout the Yellow Sea off Korea was the only instruction this commander had; it was long before the declaration of the Chino-Nippon War; before Tokyo made up its mind to fight. Out of the melting purple of mists which curtained the very picture of peace of the autumnal sea there rose slowly above the horizon a fleet of ships. The "Naniwa" forgot the leisurely pace of a few moments ago. Very soon, standing away not far from her, was a fleet of Chinese transports. Among them was the now famous "Kowshing," British vessel she was, and altho she had been chartered by the Chinese Government, she was still flying the British flag. Togo, upon the bridge of the "Naniwa," did not wish for any more pointed declaration of war than the fleet of transports before him, crowded with the Chinese soldiers. Moreover, he knew that if the soldiers succeeded in effecting their landing on the Korean soil the course of his country would be as uneasy as an egg at the end of a cobweb thread. The "Naniwa" signaled the transports to stop; they ignored the signal; the signal was repeated; no sign of compliance. And Togo upon the bridge did not speak. I have intimated that he wrote a wordless preface; perhaps I have not been correct. For on this occasion, altho Togo spoke not, the broadside of the "Naniwa" did speak. The transport "Kowshing" passed into the cool depths of the Yellow Sea and into history; and the abrupt and word-

less preface which Togo wrote to the Chino-Nippon War passed also into history.

Like Oyama, Kuroki and Kamimura, Admiral Togo is of the Satsuma clan. He was born of an ancient samurai family in the fourth year of the period called Kaei, 1851 A. D. From his youth up his life has been devoted exclusively to the service of his country, to the study and practice of the art of national defense. He was one of the few young men whom the Nippon Government saw fit to send abroad for technical education. On the training ship "Worcester," he received his English schooling. In recognition of his many and manifold services to the State his master, the Emperor, on the sixth day of the sixth moon of Meiji, 1904, promoted him to the full rank of Admiral.

True to the time honored ideal of the soldier of Nippon, Admiral Togo is very far from being a fighting man pure and simple. He is a scholar as well. "I am no scholar," he said once, as you might expect him to say. "From my early youth, however, my masters have compelled me to examine and follow carefully the teachings of the school of O Yomei. It seems to me that a soldier can derive a great deal of benefit from the study of Yomei." And perhaps the granite coolness of the commander of the United Squadrons of Nippon is largely due to the strict observance of the principles of Yomei, who taught that the cardinal element in the make-up of a great man is the poise of the soul so serene that no trifles such as the turmoils and affairs of the earth and its life should have the power of disturbing its equilibrium.

# Why I Left the Ministry for Socialist Propaganda

BY ANOTHER SOCIALIST

[The writer of the following article is a Socialist of international repute whose identity must, for obvious reasons, be hidden. In this frank statement of personal experiences we have another view of the problem of the relation of the Church and Socialism from that presented in the article "Why I Returned to the Ministry," by "A Socialist," which appeared in *THE INDEPENDENT* May 11th, 1905. These two articles open the question, now of vital importance, whether the Church is still the most efficient organization for the promotion of the brotherhood of man, or, if not, can anything be done to make it a truer exponent of this Christian ideal. We shall be glad to publish a few brief and frank opinions or "experiences" from ministers and others on this subject.—EDITOR.]

SOME years ago I was one of a small party of men and women prominently identified with the international Socialist movement who met in Paris for friendly intercourse and greetings on the eve of a somewhat remarkable international conference. In that party there were writers of world-wide celebrity, scientists of world distinction and authority, orators whose words have thrilled Parliaments, worried Governments and coursed along the cables from continent to continent; political agitators and conspirators whose work has kept busy the secret police of half a dozen nations and whose biographies are largely told in police records, and some, like myself, less known either to fame or infamy. That party will never be gathered together again, for some of its members have entered the Great Unknown. After the manner of our restless kind we sat and talked all through the night and parted only when the workaday world began its bustle and noise. Each of us told the others the story of our lives, with their most important experiences, with a frankness that seems astonishing now, even to myself. No critic's scalpel could have laid our lives bare more relentlessly than did we of our free choice. There was, of course, considerable variety in our experiences, but there was also a notable similarity which was much commented upon. One, the oldest and best beloved of us all, summed up the results of what he called our "confessional debauch" by saying: "How wonderfully alike, after all, are human experiences, but how different really have been the experiences that seem alike!"

I am reminded of the incident and the sage aphorism by the charmingly frank story of my anonymous comrade, "A Socialist." I shall not speculate concerning his identity nor reveal my own, my hope being that he will include me in his circle of comradeship as unreservedly as I include him. And in telling why I left the ministry and fellowship of the Church, why I have turned from it with renewed conviction that for me it has neither spiritual life nor inspiration when, time after time, I have gone back to it; why to me the Church represents the worst kind of infidelity—unfaith to the common life of the world—I want to be as frank as I am with my own soul. And even as there is no bitterness in my heart toward the Church, I want this record to be as free from it.

My boyhood history divides itself into two periods. Born in the lap of luxury and ease, ministered to by a small army of servants and already superciliously proud of my family heritage, I yet knew by the time I reached my "teens" the pangs of poverty. It was not the comfortable "poverty" of the poor-rich, but the real kind—the harrowing, grinding poverty that blights and damns. I became a boy wage-worker. That is all I need tell of my boyhood; it is set down only that what follows may be better understood.

I worked hard by day for bread, and harder still by night, whether for glory or for higher reasons who shall say? Perhaps both in almost equal measure, for I had decided to devote myself to the ministry—to preach the Gospel of the Christ whose pure, sweet life has always

held for me so much enchantment. To that end I worked my way, alone and unaided, through Oxford, and its diploma, facing me as I write, calls up memories of a long and anxious struggle. I joined the ministry of one of the great Nonconformist bodies. My experiences in the years of toil and poverty determined my choice—it was essentially more the Church of the common people than was the State Church, in which more than one ancestor had won lasting honor and distinction.

My first appointment was to a large and rather wealthy church in one of the great industrial centers of England, and I at once achieved considerable success alike as preacher and pastor. To my success as preacher the files of the denominational papers of the period bear witness, and my success as pastor may be gauged from the fact that the membership roll was nearly doubled in the first two years and the Men's Bible Class of thirty members developed into a Men's Sunday Afternoon Association of over one thousand. At these services I dealt honestly and fearlessly—tho not always wisely, I now think—with all sorts of topics, social, religious, political. Nothing was too secular for my concept of religion. I believed that the Church had a great mission to perform in the solution of the grave social problems of the day. "Social Christianity" was a phrase much in vogue then and I probably overworked it. But one thing I proved, to my own satisfaction at least—that I had rightly diagnosed that disease of the modern Church whose chief symptom is failure to attract the masses. I had shown the answer to the question, "Why do so few of the workers attend church?" to be that they *would* attend whenever the Church interested itself in their engrossing life-problems. My church was filled to overflowing and there was never a question of "empty pews."

But my ministry was short lived. Before the end of my third year it had ended by my voluntary choice. Almost from the very first month there had been difficulties in my own mind which grew to insufferable proportions. My whole being revolted against the cruel, inhuman doctrine of Eternal Torment, of the preaching of which there seemed to be a

temporary revival. With all my strength and enthusiasm I preached the idea of "a decent, civilized, humane God," much to the consternation of some of the most influential members. Still, in justice to them, I must say that had there been no other difficulty than this of doctrine I should probably have remained in the Church. Probably, too, I should have succeeded in my efforts to implant in their minds and hearts a better and lovelier conception of the great All Father. Such is my belief even now.

But there were other and greater difficulties than this of doctrine. I found my spiritual life drooping and dying in the arid soil of the Church. Among the members there seemed to be little faith in the teachings of the Christ they professed to serve. Their lives repudiated the great Human Brotherhood which Jesus taught. It seemed to me then, as it seems now after the lapse of years, that their "religion" had little or no influence upon their lives. I soon found that the most unscrupulous and corrupt politicians in the city were among the most influential members of my own congregation, and some of the worst employers and oppressors of the poor. It all came to me as a revelation when a workingman member of the congregation asked me to help him find employment. I knew him to be a good workman, for his former employer, a prominent member and official in the Church, had told me so. Why, then, was he unemployed? He had been discharged, without a reference, for no other reason than that he had supported the candidature of a certain candidate whose election the employer wished to prevent. So this "Christian," because he could not control his soul as well as his body, had discharged his "brother"! In vain did I beg for that man's reinstatement in the name of the Brother-Christ, in vain did I plead even for a satisfactory reference to enable him to obtain a living for his wife and four children. The employer was obdurate and resented my efforts. "Business is business," I was told, and "nothing to do with the Church" or the pastor. In the end the workman had to break up his little home and move to another city. Henceforth I kept asking myself the old, old question: "*Can a man be brother to his master or the master*

*brother to his employee? Are not the very terms significant of a social relationship which excludes the possibility of brotherhood?"* I was not yet prepared to answer in the affirmative, but a few more experiences led me to that. There was a strike among the employees of a great factory owned by some people in my congregation—people who had been very good to me and treated me as their son. I investigated the cause of the strike and found conditions appalling in their degradation. At first I could not believe my friends knew of these conditions, so I went to them hoping that I might be of service to the men and women workers. But here, again, I was repulsed; my friends knew all that I knew and a good deal more, but they were not interested in the fate of the workers, many of whom were fellow church members. With them, too, "Business was business"! Here, then, in this failure to vitalize their Christian professions and in the urgent need of the struggling and defenseless workers I recognized the call of Christ to leave the Church and its creeds for the truly religious work of social reconstruction.

Accordingly, one Saturday, soon after the strike began, I sent a special invitation to the strikers' meeting urging all who could to attend my church on the following morning, when I should preach upon the issues of the strike. How they flocked into the church, crowding it to the utmost limit! And how I preached! With the majestically solemn words of the epistle to the Angel of the Laodicean Church for text I tried to voice wronged Labor's cry, "I will spew thee out of my mouth." That day I left the ministry and next day joined in the active leadership of the strike. My life was, it seemed to me, consecrated to a wider ministry henceforth. I was not yet, however, a full-fledged Socialist, and could not yet satisfactorily answer the questions concerning brotherhood which had so long haunted me. That came later as the result of earnest study and association with two Socialist workingmen among the strikers. These men were desperately poor and theoretically atheists, but I had never met men more truly religious in the Church. Their profound faith in the great cardinal Christian principle of Human Brotherhood was an inspiration

to me—an inspiration which abides even to this day, after long years of strife, disappointment and association with cynicism. I am persuaded that had Christ come to that city these men would have welcomed him and assisted him, while the Church would have turned him away. At last, then, I could answer the Great Question. I felt in my very soul that no man could be Brother to the Master of his Bread, and no man could be Master of another's life and at the same time know him for his Brother. I was henceforth a Socialist.

When the strike ended—in our defeat—I had to face the problem of getting a living. I had no trade and no commercial training. I was a maker of sermons and had voluntarily and religiously closed the market for my wares. Temporarily I became a laborer at the docks for the princely wage of four dollars a week. Night after night I dragged myself home too tired to eat, my back aching terribly and my hands torn and bleeding. I missed the ease and refinement of my old life, I missed many things which my \$2,000 a year had made possible, but I gained self-respect and spiritual peace. Without thought of price or financial gain I had a new pulpit in my spare time—evenings after ten hours' toil and Sundays—the soap-box at the street corners. Quixotic, you say? Well, perhaps so; but if I had to go through life again under the same conditions I should pray for strength to do the same. I knew what the "Blacklist" meant in those days and the hunger and suffering the "Blacklist" brings with it. Many a night have I slept in some doorway or beneath some arch. Socialism didn't pay and, thank heavens, there was no opportunity for the professional Socialist agitator. Many times I have given Socialist lectures while desperately hungry and afterward in my pride have refused to accept "carfare" from my comrades, tho I was thus obliged to walk many miles. I have known scores of others to do the same thing. I do not defend it, nor do I criticise it. I merely set it down as an interesting phase of many a Socialist agitator's life.

But such poverty is hard to bear, especially for one who has known the sweets and comforts of life. However

the earnest soul rebels against "tainted money," hunger is a terrible trial. Perhaps, therefore, it was just as much the latter—or even more so—than the conviction that the ministry claimed my life which induced me to accept an invitation, delicately proffered by a good friend, to preach in a Unitarian Church with a view to accepting its pastorate. Two Sundays I preached there, four sermons in all. I shall never forget the agony of soul I suffered the night that preceded the day upon which I had to give my decision to the Church committee. They liked my preaching and I liked their intellectual freedom tremendously. My love for the ministry of the pulpit drew me on; poverty pushed in the same direction. On the other hand, the Socialist ideal beckoned me to the field of strife and sacrifice. Fear held me captive. When I entered the meeting of the committee I did not know what my answer was to be, tho I felt most inclined to accept the appointment. But I did not. I refused in the most emphatic terms and turned again to Socialism, poverty and freedom. Why this decision? the reader may ask, and I can only reply, because I saw in this church practically identical social conditions. Here, too, the masters of other men's lives vainly babbled of a Brotherhood they could not feel, and here, too, I felt the old spiritual asphyxiation. I knew that there was no way in which I could be free to voice wronged Labor's demands and to fight its battles while I remained in the pulpit, and if I kept silent my conscience must forever accuse me of the betrayal of my own soul. I had kept faith with my soul—I was free!

Newspaper work, so much easier for me than laboring at the docks, tho not without its hardships, kept me from real poverty during the next few years, but the conflict between Socialism and material interests was never far away. Sometimes one had to refuse to write—even under the cover of anonymity—things opposed to one's convictions. Sometimes one had to speak, when silence was not golden, but black and treacherous. And the fact of being a known Socialist was enough to keep a good deal of grist from one's mill. One never got far above the line of bare subsistence, but there was always compara-

tive freedom and, above all, the joy of the most loyal and splendid comradeship. From England's great poet-artist down to the unlettered comrade at the dock-gates looking for work there came only comradeship, loyal and inspiring comradeship. Years have widened the circle, till now its circumference includes many lands, and I aver that of all that my life has known of spiritual good "the dear love of comrades," of which Whitman sang and which the Socialist movement more than any other comprehends, must be accounted best and most precious.

I had been away from the Church several years after my experiment with the Unitarian Church when an intense longing for the ministry again beset me. Could I find a congregation willing to give me complete freedom? An old friend, a brother minister of the old days, said that I could. "You will find a great change in the Church now; the old conditions no longer obtain. There is not the same narrowness; the Church nowadays recognizes its social obligations." This and much more to the same effect led me again to the pulpit, in a smaller church of my old denomination. No man ever entered the service of the Church with more earnest desire to give himself unreservedly to its highest and best work or with greater longing for the anchorage of its faith. But in vain. In less than three months I was outside again. I had found the old conditions still prevailing. There was no real belief in the Gospel of Brotherhood. Earnest enough about the welfare of the souls of Hottentots in Africa, these Christians cared little or nothing for the *bodies* or the souls of the men, women and children of their own town. In a dim way they realized that salvation of the souls of these fellow creatures at home could not be accomplished except through salvation of their bodies. And Vested Interests forbade that. Here was the Slum-lord and the Work-lord, here, in the Church of Christ; corrupt and selfish political power was ensconced in the pews. I was helpless in the pulpit. So long as my bread came from these sources I was prevented from attacking the roots of the evils which mocked my preaching and distressed my soul. Could I accept my salary knowing that it came in large part directly from the oppressors of the poor,

and that I could not accept it upon other terms than keeping silent upon the real causes of social strife and misery, without shame and humiliation? I answered these questionings of my soul when, for the third and last time, I stepped out from the ministry, free!

I came to America and devoted myself to teaching and to such literary work as I had time for. From coast to coast I have lectured for Socialism, and my vote and influence in the last election went for Mr. Debs. I have not been hired to speak, and no man has ever attempted to restrict my utterance. Just as I have found far more comradeship and spirituality in the Socialist movement than in the Church, so have I found far greater liberty. And with the growth of material prosperity my love for Socialism has also grown. Naturally, I have studied carefully, as carefully as an outsider may, the situation of the Church here in relation to the social problem. I have discussed the question with scores of ministers of various denominations and I have not been able to find that conditions are better than in the Old World. Sometimes, indeed, I have thought them worse. I know at least a dozen men in this country who have been forced to leave their pulpits on account of their Socialism, and I know more than twice as many who would gladly leave the

Church if they could, so keenly do they feel the oppression by which they are hampered and confined. Caged bird never yearned for the freedom of the fields with greater earnestness than many of these men are to-day yearning for independence, economic and moral.

If this reads like an arraignment of the Church it is only so in the sense that the Church life as I and many others know it is its own arraignment. I have but set down my personal experiences. No one, I think, can justly say that I have judged the Church hastily or harshly. Drawn to it by the purity of its ideals, by the matchless beauty of the life of its founder, Christ, I have been repelled by its unfaith, its hypocrisy and mammon worship. Despite its often loudly proclaimed materialism, I have found more of the spirit of Jesus in the political Socialist movement than in the Church. Like "A Socialist," I have tried both; but, unlike him, I have found that I can be a better and more useful Socialist outside of the Church; aye, a better Christian in the Socialist Army fighting for the Commonwealth of Emancipated Labor than in the pulpit. How true are dear Liebknecht's words: "How wonderfully alike, after all, are human experiences, but how different really have been the experiences that seem alike!"

## The Cross of Father Agaphon

BY ERNEST CROSBY

THEY flocked from hovels far and near  
Before the break of day,  
And down dark alleys deep with snow  
In silence made their way;  
And there were workers with their wives  
In holiday attire,  
And maids and lads and babes-in-arms  
And many an aged sire.

For it was Father Agaphon  
Who told them they must meet  
And gather round his golden Cross  
Upon the great high street.  
And they must come unarmed, he said,  
As friends and not as foes,  
To bear their grievance to the Czar  
And tell him of their woes.

For he their Little Father was,  
Who loved his people well,  
And when he learned their wretched plight  
And how it all befell  
Full soon their rights he would accord  
Of wage and life and limb.  
"So let us take the Cross," quoth he,  
"And march with it to him."

And happy was that Cross forsooth  
In that blithe companie  
Of toilers and their kith and kin,  
All marching to be free.  
And thus that happy Cross spake forth,  
When as the rising sun  
Tipped with one ray its gilded arms,  
Before the march begun.

"Thank God!" it cried, "once more I see  
The goodly days of old,  
When I was champion of the poor,  
Nor masked by foil of gold;—  
When husbandmen and fisher-folk  
Held me with love on high,  
And when I sought the humblest cot  
And passed the palace by.

"Too long have I been overlaid  
With chrysolites and pearls,  
Reposing on the crowns of kings  
And coronets of earls;—  
Too long on conquerors' standards borne  
Above a prostrate foe,—  
The badge of wealth, ambition, rank,  
Disdain and pomp and show.

"Too long have prelates made of me  
The symbol of their pride,—  
The summit of their mitre's boast,  
And all their sins beside.  
Too long on vast cathedral domes  
I chose to dominate,  
And grace the sway of tyrant kings  
And army, Church and State.

"But *here* it is that I was born,  
And *here* that I belong,  
Among God's common populace,  
To lead against the wrong.  
Freedom and love, the spirits twain  
Upon my bosom crost,  
And now, again, I feel their throb,  
For many ages lost."

Then forth marched Father Agaphon,  
Holding the Cross before,  
And at his heels the eager throng  
Pressed round him more and more.  
And now ere long they look to find,  
Seated upon his throne,  
Their Little Father, who can best  
Provide for all his own.

But, hark! The beat of marching feet,—  
Beyond the bridge,—just there!  
They halt,—a sharp report is heard,—  
And, whistling through the air,  
The fiend of death flies past unseen  
With gasp and groan and shriek.  
A score fall writhing round the Cross  
Ere Agaphon can speak.

And did he fall a victim, too?  
Alas! that none should know.  
He leads no longer, and the Cross  
Sinks in the blood-stained snow.  
The dead and dying spread around,  
Woman and man and child;  
For thus the Little Father thinks  
They may be reconciled!

And as the Cross lay under foot,  
What may its thoughts have been?  
Still of the goodly olden times,  
Those days of stress, I ween,—  
When in the bleak arena's hush  
The martyr kissed its face,  
While the wild beasts of yore closed in  
To give their death-embrace;—

And of the ancient lowly poor  
Hunted by Roman lords,  
Or borne in slavery away  
By Goth and Vandal hordes;—  
Or of its very natal day  
Of agony and shame,  
When on the crest of Golgotha  
It won its glorious name.

For then it was,—as never since,—  
The sign of men oppressed,—  
Of those who strove for liberty,  
And those who longed for rest.  
Who stole it for the despot-brood?  
That was a foul deed done!  
But God bless him who brought it back,—  
Good Father Agaphon!

The Cross is now at home once more;  
The exile has returned;  
And from it we may learn again  
What erst the glad world learned,—  
The old good tidings to the poor,  
The lesson of the free,  
The prophecies of neighbor-love  
And golden equity.

Henceforth let kings and Czars proclaim  
What villainies they please,—  
Rapine and war and violence,  
And things still worse than these;  
But wo to them if e'er again  
They claim a right divine  
To raise above the Cross of love  
As their imperial sign!

And those who fell, perchance they reached  
Another Father's throne,  
And there they had a tale to tell  
To turn a heart of stone.  
And lo! they say the coward-Czar  
Upon his tinsel chair,  
Whene'er he thinks of that just bar,  
Trembles with chill despair.

NEW YORK CITY.

# Mr. Rockefeller as a Truth Teller

BY WASHINGTON GLADDEN, D.D., LL.D.

**M**R. MURPHY'S second reply appeared during a long absence from my home, and my answer is therefore much delayed. I will make it as brief as I can.

Mr. Murphy has made it clear that there were two charters with similar names granted by the Pennsylvania Legislature—that of “the Southern Improvement Company” and that of “the South Improvement Company.” The latter charter was granted, as he says, May 6th, 1871. I expressed a doubt of the existence of this latter charter, tho admitting that it might have existed. That doubt was based upon a thorough examination of the laws of 1871. It did not appear among those laws. In fact, the charter was published in an appendix to the laws of 1872. I did not look for it in that volume. Good lawyers tell me that they would never have thought of looking there for it. There is something mysterious about this publication; it is evident that the charter had a suspicious origin.

The fact, however, is as Mr. Murphy stated it. He is right in this matter, and I am wrong. A “South Improvement Company” was chartered by the Pennsylvania Legislature; it was this charter which Mr. Rockefeller and his friends purchased, and under which they organized, in January, 1872; and when the question was put to Mr. Rockefeller whether he was a member of “the *Southern* Improvement Company,” and he said that he was not, he could not, under that answer, have been convicted of perjury.

It must, however, be stated that the South Improvement Company, of which he was a member, was known through all its existence under both these names. Miss Tarbell quotes two pledges of secrecy which its members were required to sign; in one of these it is called the “South,” and in the other the “*Southern*” Improvement Company. In Miss

Tarbell's book is a *fac-simile* of the black list of its members published while it was in existence in the *Oil City Derrick*, in which it was called “the Southern Improvement Company.” Miss Tarbell says that “when W. G. Worden, the secretary of the company, was on the stand in Washington before the investigating committee in March, 1872, he *used both terms to refer to the scheme.*”

It must also be remembered that it was this company, known by two names, and no other, about which information was sought. It does not appear that any other company with a similar name had been mentioned. There is no reason to believe that the existence of any other company was known to any one conducting the investigation. When the words “Southern Improvement Company” were used by the questioner the meaning of the question must have been understood, and when Mr. Rockefeller replied that he was not a member of the company he, of course, knew that his words would convey a false impression. Mr. Murphy says that it is puerile to expect any man to answer a question, under oath, in the sense in which he knows that it is asked. It may be, if one wishes to conceal the truth; but if he means to tell “the truth, the whole truth and nothing but the truth” it is not puerile.

So far, therefore, as this incident illustrates Mr. Rockefeller's veracity we may say that it shows that he is willing to use language upon the witness stand in such a way as to convey a false impression, without exposing himself to the penalties of perjury. If we keep this in mind in our consideration of his statements we shall not be misled.

There are two or three other bits of testimony, however, which are not so easily explained. A few minutes later in the investigation these questions were asked and answered:

“Q. Hasn't some company or companies

embraced within this Trust enjoyed from railroads more favorable freight rates than those rates accorded to refineries not in the Trust?"

"A. I do not recall anything of the kind."

"Q. You have heard of such things?"

"A. I have heard much in the papers about it." (N. Y. Senate Reports, 1888; Document 50, p. 420.)

Before this investigation the Ohio Supreme Court had denounced in the following language an arrangement made between the Lake Shore Railroad and the Standard Oil Company:

"The understanding was to keep the price *down* for the favored customer, but *up* for all others, and the inevitable tendency and effect of this contract was to enable the Standard Oil Company to establish and maintain an overshadowing monopoly, to ruin all other operators and drive them out of business in all the region supplied by the defendant's road, its branches and connecting lines."—Ohio State Reports, 43, pages 571-613.

This was one of many similar transactions which Mr. Rockefeller, under oath, could not recall.

In an earlier page of the same report the following testimony is found:

"Q. Have they [the managers of the Standard Oil Trust] sought in any way to diminish the amount of production of refined oil produced by refineries which were not represented in the Trust—I mean outside—that might come into competition with them?"

"A. Oh, no, sir."

"Q. Nothing of the kind?"

"A. Oh, no, sir."

"Q. Do I understand you that they have not sought in any way to make the operations of refineries outside the Trust so unprofitable that parties would come into the Trust or have to abandon the business; has anything of that sort been done?"

"A. They have not; no, sir, they have not."

N. Y. Senate Reports, 1888; 50, p. 385.)

Finally, in 1880, Mr. Rockefeller made the following affidavit, as quoted by Miss Tarbell:

"It is not true, as stated by Mr. Teagle in his affidavit, that the Standard Oil Company, directly or indirectly through its officers or agents, owns or controls the works of Worden, Frew & Co., Lockhart, Frew & Co., J. A. Bostwick & Co., C. Pratt & Co., Acme Refining Company, Imperial Refining Company, Camden Consolidated Company and the Devoe Manufacturing Company; nor is it true that the Standard Oil Company, directly or indirectly through its officers or agents, owns or controls the refinery at Hunter's Point, N. Y. It is not true that the Standard Oil Company, through its officers or agents, purchased or acquired the Empire Transportation Company, or furnished the money therefor." Vol. I, p. 230.

On p. 191 is the testimony of President Cassatt, of the Pennsylvania Railway, that the entire property of the Empire Transportation Company had been purchased by the Standard in October, 1877; that "the negotiations were carried on in Philadelphia, Mr. Rockefeller and Mr. Flagler mainly representing the Standard." All the details of the transaction are given, showing that the Standard Oil Company's officers and agents did purchase the property of the Empire Transportation Company. "There is also," says Miss Tarbell, "abundant evidence in existence that the works of Messrs. Pratt, Lockhart and Worden, at least, had been bought long before this affidavit was made, and paid for in Standard Oil Company stock, and that they were working in alliance with that company."

I have given these citations at some length because I do not wish to have it appear that the credibility of Mr. Rockefeller as a witness has been lightly questioned. The methods by which he has built up the largest fortune known to human history are now under investigation, and those who defend or apologize for those methods rely largely on his own statements. The question concerning the value of his testimony is therefore pertinent.

COLUMBUS, OHIO.

# A Decision of Most Profound Importance

BY JOHN W. FOSTER, LL.D.

EX-SECRETARY OF STATE

THE above title is the characterization by Mr. Justice Brewer of a decision recently rendered by the Supreme Court of the United States in a Chinese case. It adds another to the long list of acts of an unfriendly class inflicted upon the Chinese people which have reflected so unfavorably upon our nation.

The case, briefly stated, is that of a native-born citizen of the United States who, having made a visit to China, the country of his parents, on reaching San Francisco was held by the immigration officials to be a Chinaman and was refused admittance into the United States. Under a writ of *habeas corpus* he was brought before the United States District Judge of San Francisco, who upon hearing evidence decided that, having been born in this country, he was a citizen of the United States and as such entitled to admission. The case was appealed by the Federal authorities through the Circuit Court of Appeals to the Supreme Court. The latter court has just held that, in view of the act of Congress of August 18th, 1894, which provided that the decision of the proper immigration officer excluding an alien from admission is final, there can be no adjudication of the question of citizenship by the courts and that relief cannot be had through the writ of *habeas corpus*.

If this is to stand as the law in the United States, punishment by banishment may be inflicted upon a citizen of the United States in violation of what have heretofore been held to be inestimable guaranties of the Constitution. Article III, section 2, provided that "the trial of all crimes, except in cases of impeachment, shall be by jury;" and by the Fifth Amendment no person can "be deprived of life, liberty or property without due process of law," and, further, "no person shall be held to answer for a capital or otherwise infamous crime, unless

on presentment or indictment of a grand jury." The highest court of our country has decided that due process of law is granted by the hearing before the immigration official; that trial by jury may be in the same way superseded; that a citizen may suffer the infamous punishment of perpetual banishment from the land of his birth by the same procedure, and that the writ of *habeas corpus*, so dearly prized as "the remedy which the law gives for the enforcement of the civil right of personal liberty," is ineffective against the decision of an obscure immigration officer.

Let us see what is this "due process of law." The immigration officer who controls the Constitutional guaranties above cited is rarely if ever possessed of any legal education and is chosen rather because of his fitness as a police officer or detective. Under the authority of the laws passed by Congress for the exclusion of Chinese laborers a series of rules have been adopted by the Immigration Bureau. These rules provide that when a Chinese person arrives at a port or on the frontier of the United States the immigration officer shall prevent the Chinese person from having communication with any one but the officer; that the officer shall examine him in private touching his right to admission, without any opportunity to secure the assistance of an attorney or friend, and that only such witnesses shall be heard as the examining officer shall designate, and they examined in private. In this way the right of the Chinese applicant to admission is determined. If admission is denied, the applicant is advised of his right of appeal to the Secretary of Commerce and Labor, when he can employ counsel, who is permitted, upon filing notice of appeal, to examine, but not to copy, the *ex parte* evidence taken by the immigration officer. Notice of appeal

must be filed within two days, and within three days a record of the case, including new affidavits (for there is no open or public hearing) must be forwarded to Washington. The burden of proof is placed on the Chinese person, and in every doubtful case the benefit of the doubt is given to the Government. No provision is made for summoning witnesses from a distance (for instance from the State in which the applicant was born) or taking depositions.

Well might Mr. Justice Brewer ask:

"If this be not a star chamber proceeding of the most stringent sort, what more is necessary to make it one? I do not see how any one can read these rules and hold that they constitute due process of law for the arrest and deportation of a citizen of the United States."

And this in a case where the applicant had been judicially determined to be an American citizen. Under such circumstances the Justice quoted and the two colleagues who unite with him in dissent (Justices Peckham and Day) are justified in the declaration: "Such a decision is appalling."

I give the concluding paragraph of the dissenting opinion:

"The statutes of the United States expressly limit the finality of the determination of the immigration officers to the case of aliens. It has been conceded by the Government that those statutes do not apply to citizens, and this court made a most important decision based upon that concession. The rules of the department declare that the statutes do not apply to citizens, and yet in the face of all this we are told that they may be enforced against citizens, and that Congress so intended. Banishment of a citizen not merely removes him from the limits of his native land, but puts him beyond reach of any of the protecting clauses of the Constitution. In other words, it strips him of the rights which are given to a citizen. I cannot believe that Congress intended to provide that a citizen, simply because he belongs to an obnoxious race, can be deprived of all the liberty and protection which the Constitution guarantees, and if it did so intend, I do not believe that it has the power to do so."

The act of Congress which has brought about this "appalling decision" was inserted as an amendment to the Sundry Civil appropriation bill of 1894, and illustrates the evil effects of such a method of procuring legislation. It was prepared at the Immigration Bureau, "smuggled" into the appropriation bill, where it had no legitimate place, and went through Congress without its real character being detected. As Justice Brewer remarks, doubtless Congress did not intend by its enactment to make it apply to citizens or to deprive them of their Constitutional guaranties.

It is not my purpose to arraign the majority of the Supreme Court. If I attempted it I could not use stronger language than that uttered by one of its own members. Possibly the court believed with President Grant that the best way to secure the repeal of a bad law was to enforce it vigorously. Such ought to be the result of the recent decision. When it is so plainly made to appear that under the act of 1894, as interpreted by the Supreme Court, an immigration officer may by a star chamber proceeding exclude a native-born citizen from his own country, Congress ought not to hesitate to repeal the law or so modify it as to remove this objectionable power.

This occurrence emphasizes the necessity of cultivating among our people, and especially our rulers and lawmakers, a higher standard of justice in the treatment of the Chinese race. Our Secretary of State has justly won the commendation of his countrymen for his efforts to preserve the independence and integrity of that great Empire so that our trade with it shall be free and unrestricted. Our Churches are contributing many millions of dollars to carry thither our religion and our civilization. But Congress, under the whip and spur of a small section of our population, enacts legislation which affronts and maltreats that cultivated and populous nationality and in great measure undoes the enlightened work of our Government and the Churches.

WASHINGTON, D. C.

# Symbolism in Dress

BY CHARLOTTE PERKINS GILMAN

AUTHOR OF "WOMEN AND ECONOMICS," "THE HOME," "HUMAN WORK," ETC.

THERE are many elements combined in the most ordinary article of clothing; long-drawn strains of slowly dying influence from ancient times, young shoots born of new conditions, a body of persistent commonplace necessities, and, over it all, a kinetoscope flicker of evanescent "style."

As a typical garment for this study none is more perfect than the shirt. The shirt is indeed the typical garment; from it in its first vague forms have been evolved all clothing for the body except what has crept up from the feet, as mocasins, leggings and trousers. Our remote ancestors, wrapping themselves in the hides of their prey, found a large piece of leather, however daintily "dressed" by the patiently chewing women, a clumsy thing to keep on the body. They tied it with thongs and pinned it with thorns, and some bright genius finally cut a hole in it and stuck his head through. This was a great step and introduced the poncho, still in fashion in South America, and an excellent garment for horseback riding in the rain.

There remained much unnecessary bulk about the waist, even when tied in; so another fertile mind, holding his arms out straight sideways, while the flat hide fell before and behind him, had large pieces cut out from the space between arms and side, sewed up the edges of what remained, and the shirt was born.

This body-garment put on over the head is liable to innumerable varieties of development and may be traced through them in the history of dress.

It grew longer and longer, under influences of luxury and idleness, and the symbolism of dignity and display, forming the robe and gown in all their myriad shapes; and was cut in two to make the petticoat. Its sleeves have trailed voluminously, pinched and bagged and puffed stiffly out, shrunk and shortened and disappeared to a shadowy shoulder strap, and the upper part has been cut away

well nigh to the waist in women's exhibition clothes; but the shirt is still the parent type for all this variation. It has survived through all the ages; fashion again and again has left man "stripped to his shirt," but always left him that. There is no lesser garment unless it is a pair of bathing tights. This venerable article, still useful, even indispensable, one would suppose to be as free from casual influences as any, as legitimately governed by the practical necessities of human clothing. These are obvious: First, protection, as against cold, wet and friction or worse attack, and second, modesty. These, with economic limitations and changes to suit local needs, would seem to be enough to govern a shirt, and where the shirt is wholly invisible they are. An undershirt is a purely personal garment, giving a soft, warm, decorous covering, comfortable to the wearer, and blameless—save sometimes for its price. This, like the inner lining of the chestnut burr or the soft skin of an egg, is delicately suited to its uses. Where it is the only shirt, or at least the principal one and often visible, as in some classes of labor, it becomes somewhat heavier and more resisting—outside wear being now a condition as well as inside warmth—but in general it is a gentle and satisfying garment. Not so the shirt proper, the shirt of commerce, the shirt which is a signboard and visiting card far more than a garment. Since the undershirt was adopted and became the legitimate garment, doing the shirt's work perfectly, the cotton or linen simulacrum outside was exempt from the pressure of legitimate needs, and left free to vary under the force of quite different influences.

There are several strong modifying forces constantly playing upon our garments, and only a strict obedience to necessity saves any of them for normal use. Once absolved, even partially, from that use, and there are no limits to the

freaks of our clothing. There is the decorative impulse, apparently earlier than even modesty in savage tribes, and the instinct of display, the "conspicuous consumption" of Veblen; besides the real symbolism which is neither one nor the other.

As symbolism pure and simple we wear mourning, or at least women do. That men do not is because their clothes are so much more directly governed by use and they are so much more important members of society. We could not afford to have our motormen wear long crape veils. Fancy a court room with the judge covered as if about to be hanged! Fancy a railroad conductor coming down the aisle with a heavy black veil on! Fancy your butcher cutting chops with this somber drapery over his extremely necessary white apron! Fancy any human being of any sort of use cumbering his necessary activities with "the trappings of wo"! He could not afford it. We could not afford to have it. He reduces his symbolic grief to a hatband and strip about the sleeve, black gloves and tie, if he is well-to-do and punctilious, and his grief is just as real as if he were an ancient Hebrew rending his garments and defiling his hair with ashes.

But women, who are not generally members of society at all, but only members of the family, preserve in that primitive status the primitive habits which belong to its heyday, the patriarchal era, and change the questionable reason of their usual clothes into the unquestionable folly of symbolic mourning.

If they feel the need of advertising their distress, why not do it in the papers: "Mrs. A. A. Johnsmith, widow, wishes to announce that she is prostrated with grief to the extent of \$3 a yard—and 27 yards. Ohio papers please copy." The reign of symbolism even in our age of airships is still strong.

To return to our shirt, our "boiled shirt," deputizing its primal use to the undershirt, and becoming not a necessary garment, but "the mark of a gentleman."

Its first essential, cleanness, especially cleanness of the exhibitable parts, is far more a proof of good taste and ability to pay laundry bills than any personal delicacy, for these same exhibitable parts are not, like the undershirt, in contact

with the body, nor, like the coat, in contact with all manner of outside dirt.

A woolen coat, thick, heavy, dark colored, is worn for a year, two years, three years—a good overcoat for many years—without washing. The dust falls on it, the rain wets it and the dirt soaks in; it is rubbed against the coats of other men equally long-suffering; if it was white at first it would look as foul as a mujik's sheepskin. Little care we. It does not "show."

Neither does the undershirt. That is the garment that cries for washing. But there are two or three or more outer for one under in the average wash. The white shirt with its snowy collar and cuffs symbolizes cleanliness—as the crape veil symbolizes grief. And what does the starch symbolize?

Starch has nothing to do with modesty and little with protection. A starched fabric would resist light friction, as a cotton skirt among bushes, for instance, better than when unstarched; but a man's shirt front meets no friction whatever. It may be a trifle warmer, serving as a chest protector of a sort.

But our friend the motorman and natives of the North in general make no use of starch for warming purposes.

"It keeps clean longer," the washwoman will tell you. This is true of an apron or petticoat, of the cuff and collar edges also, but has no bearing on the shirtfront.

That gleaming shield is also purely symbolic, giving an effect of metallic crispness far removed from the soft finish of textile fabrics, and helping to cry aloud the real song of the shirt, "I am clean!" The fineness of the linen—in a garment that does not touch the body—is but an evidence of delicate breeding and ability to pay; whereas the detachable collar and cuffs are a piece of "protective mimicry," to give the same effect of superiority in these points attained by the man who can afford to wash seven shirts a week.

There must be a noble satisfaction in the soul of the highminded and wealthy in wearing the self-collared and self-cuffed shirt; noble but incommunicable—save in the confidence of private friendship.

The clothes of men originally were

more symbolic than those of women. Among savages the "ceremonial costumes," as the dress of the war dancer or the medicine man, are mostly confined to men's wear. In all the regalia still remaining to us, royal, legal, academic, military and official of any sort, we still find men wearing, with every appearance of satisfaction, a strictly symbolic costume. See the police officers of New York; their very bodies symbolic of a plethora of power, tho it is to be doubted if such gross weight adds to efficiency in service. The costume of these men is purely an official convention, almost as much so as that of soldiers.

"The men that fought at Minden  
They 'ad stocks beneath their chins  
Six inches 'igh and more";

and such throttling could in no way add to martial valor or activity, save spiritually.

If a given article of dress is held by a given tribe of savages or body of officials as indicative of something valuable they will proudly wear it, at any physical inconvenience. The tall hat of our times is as perfect an expression of this fact as could be given. Searching the history of costume, we find proud man forever seeking to add cubits to his stature. Priest and pope, king and emperor, all manner of magnates, looming large in their own minds and wishing to express this grandeur to the popular eye, they one and all erect a totem pole upon their heads as best they may.

There is hardly a race or time where this impulse does not find some expression; and we, who have lost so much—who may no longer glory in plumed helmets and towering crests of horsehair, who have left off crown, coronet and tiara, cling desperately to the one dear remnant of former glories—the tall hat.

In general shape it follows an endless tradition. The Egyptian Pharaohs, Assyrian and Persian kings thus piled their heads.

And good Mr. Johnsmith, walking proudly in his shining "tile," transmits a race impulse thousands of years old, with never a brain throb of criticism.

The monotony of men's hats is almost as unbroken as that of turbaned Moslems, and this in proportion to the de-

gree of their civilization. As we revert to wilder earlier stages of social growth; or as some rebellious soul in himself demands a change, we find "soft hats" of various shapes: but in our greatest cities we wear a type of hat that would make a composite photograph nearly as clear as a single one. Perhaps some lingering echo of the armor period, when men's clothing was as of turtles and hedgehogs, still makes itself heard in this stiff headgear. Even the ivory shirt-front may be a faint reminiscence of the days when the steel corselet shone in the sunlight.

The racial mind is one unbroken current of transmitted impulse, and old feelings live long in it.

But if men's clothes are thus symbolic, what shall we say of women's?

If his life of a thousand activities has not yet eliminated many ancient dress-tendencies, what may we expect of hers, stationary and unvarying from the beginning of history?

We may look for symbolism nearly as dominant as in savagery; and we shall not be disappointed. The primitive instinct of decoration, once so dominant in men's clothes, is still dominant in women's and is sadly lacking in such civilized sense of beauty as should have long since elevated it. There is no lower grade of this savage decorative instinct than that which mutilates and deforms the body, yet this is a custom still maintained among women.

Men, some men, sometimes compress the feet in an effort to symbolize gentility, and in the oldest masculine order—the military—in older countries than ours men actually wear corsets and "lace." Men's corsets are advertised in European newspapers. Also in low ranks of life men still tattoo and wear earrings. But women deliberately alter the shape of the body under the conviction that it is thus beautified; as some tribes make Dutch cheeses of their "calves," and other slit the nose or file the teeth.

It is a subtle and singular study, quite apart from any questions of hygiene, this using the body as a conventional shape to convey a feeling or idea, making a sort of ideograph of it; a conventionalized symbol of a living form!

Seizing upon certain lines and pro-

portions as distinctively feminine, they would out-feminize femininity by exaggerating them. Exactly the same principle is shown in the tailor who gives to the man a pair of stuffed epaulets to broaden his shoulders. It is masculine to have a broad chest and square shoulders—typically masculine. If the customer chance to lack these distinctions, tho he be as masculine as Marshal Saxe, the tailor sees to it that his garments shall symbolize his sex beyond dispute. So the dressmaker, not some one personally responsible dressmaker, but the too complacent exponent of the racial mind, as shown in dress, sees to it that the woman shall have a small waist and large hips, quite regardless of her protesting bones and body, because she must not only be, but symbolize, femininity. This tassel of tablecloths in which we walk, yards upon yards of varied materials—cotton, woolen and silk—a mass of folds inconvenient, uncomfortable, expensive, laborious, and in every way interfering with bodily freedom and right growth; this dragging weight which makes women short-legged and thick-hipped, feeble as walkers and unable to run; which adds to the effort of every step they take and handicaps them in every danger—almost sure death in accidents by fire or water—why do women wear these graveclothes-skirts?

Absolutely and only as a matter of symbolism.

Local symbolism at that—for in Turkey and China, where women are nothing if not feminine, the skirt is not worn.

It has nothing to do with maternity, Charles Reade to the contrary notwithstanding; for the naked savage and the trousered Oriental are quite as competent in childbearing as we.

But we in our infinite wisdom have chosen to consider flowing raiment as symbolic of femininity, and, therefore, women wear it unresisting, from the less-filled cradle to the more-filled grave. As a matter of artistic symbolism it is true that lovely flowing robes do indicate leisure and dignity, and are so suitable for kings, priests and the learned professions.

Under this head both men and women will always be justified, on proper occasions, in draping the light, swift, mobile grace of the human body in the fluent folds of cloth, as we caparison a horse for proud processions.

This is no reason under heaven that she who is neither king, priest nor doctor in most cases, but mainly a hard-working house servant, should be so cruelly hampered.

At entertainments, in quiet evenings, when no exertion is required; in the pulpit, on the platform, at the desk, wherever no physical action is needed and an effect of dignity is desired, long robes are beautiful.

But to trail on dirty streets or carry painfully in the hand, making one wish for a little cart like those tied to the fat-tailed sheep; to wear behind a counter, where every ounce of weight drags heavily on the aching back, or in the kitchen to catch grease and slop and scorch, or as we see them on poor draggled scrub-women—dirty and unwholesome work made dirtier and more unwholesome by these wet trappings—in any sort of action skirts are a hindrance and an injury.

Yet as symbols we reverence and uphold them, as the Forty-niners raised their hats and hurraed at sight of a woman's washing on a clothesline.

NEW YORK CITY.

# London and the Paralyzed Parliament

BY JUSTIN McCARTHY

**I** DO not think that the phrase *paralyzed Parliament* exaggerates in any sense the condition of this present Parliament, which is now beyond all question drawing very near to its end. It seems to have lost its power of action or movement and to have hardly left in it even a consciousness of life. It can do nothing and, indeed, no longer makes any attempts to do anything. In the ordinary course of things the closing days of a Parliament are full of life and energy, of hope on the one side of the House and of resolve for a stubborn fight on the other. But in this, the present and what we must look upon as the closing, session of our Parliament there is only a quiet, easy-going confidence on the side of the Liberal Opposition and a hopeless indifference on the side of the Government.

Even the vote of censure moved a few

days ago by the leader of the Opposition, Sir Henry Campbell-Bannerman, did not bring the House into anything like a fervor of excitement. Sir Henry Campbell-Bannerman delivered a very telling, powerful and eloquent speech, arraigning the policy and the conduct of the Administration, and the debate was enlivened by many clever and even brilliant displays of argument and humor on both sides of the House, and yet somehow there never seemed to be much enthusiasm about it. The Opposition, in fact, are confident of success when the General Election comes on, and the supporters of the Government have no serious hope of being able to hold their own, while the Prime Minister, Mr. Arthur Balfour, is probably only looking out with a longing to be promptly relieved from the fatiguing and uncongenial task imposed upon him by his present official position.

Even the reappearance in the House of the late Chief Secretary for Ireland, Mr. George Wyndham, and his attempt to explain the reasons for his removal from his place in the administration of Irish affairs did not bring anything like excitement or even keen interest among the crowded listeners. The attempted explanation was, in fact, no explanation whatever, and the common impression was that Mr. Wyndham was generously endeavoring on behalf of his former official colleagues not to let the House know the full and real story of the dispute between him and them. Everybody knows that Sir Antony MacDonnell is the strong man in the whole Irish official situation, but Sir Antony MacDonnell is only Under Secretary in the Irish administration and he is a devoted advocate of the principle of Home Rule for Ireland, and the general assumption is that Mr. Wyndham was regarded by his official colleagues as having yielded too far to the influence and the advice of the man who was his subordinate. The House and public, however, were not allowed to know anything concerning the

LORD DUNRAVEN

secret details of the struggle which took place between the Under Secretary for Ireland and the leading members of the Conservative Government, and everybody who listened to or read Mr. Wyndham's speech must have felt that the late Chief Secretary was influenced by a too loyal desire not to make his own case good by disclosing any of the secret history belonging to the dispute which ended in his removal from office. This was, however, the central question of the whole debate, and when it became evident that no light was to be thrown upon that particular question the House could not bring itself to any immediate interest in the discussion. Sir Henry Campbell-Bannerman's vote of censure had not, of course, the remotest chance of being carried, for the Government still holds and must hold so long as the present Parliament endures a majority of devoted adherents quite large enough to secure for them a substantial majority in the House. That majority was, of course, maintained when the division came on Sir Henry Campbell-Bannerman's motion, and the vote of censure was decisively rejected. But this result brought no excitement with it, for everybody knew beforehand what was certain to happen, and the announcement of the Government majority was only regarded as a necessary formula like to that cry of "Who Goes Home?" which announces the adjournment of each day's sitting.

Lord Dunraven is one of the members of the paralyzed Parliament—there are not a few, I am glad to say—on whom no touch of paralysis has come. Lord Dunraven, indeed, has acquired a new reputation during the recent period of political decay. He has played many successful parts in his varied and brilliant career. He has been a distinguished soldier, a most successful war correspondent and an author of some books which are likely to live in our literature. One of these, "The Great Divide," has been read by the whole reading world everywhere. My American readers know something about his energy and his reputation as an enterprising yachtsman. Of late years he has become identified with a new movement for the redress of Irish grievances, and the theory of devolution, about which we

LABOUCHERE

heard so much during recent debates, owes its practical development mainly to him. The especial offense charged against Sir Antony MacDonnell and through him against Mr. Wyndham was that these men as Government officials had given themselves up too much to Lord Dunraven's theories as to the best method to be pursued for the remedy of Ireland's grievances. Lord Dunraven is a thorough believer in the principle that local self-government is the only principle by the operation of which a genuine and continuing improvement in Ireland's condition can be realized. He is not in favor of the principle of Home Rule for Ireland—that is to say, of the national policy which would restore to Ireland her separate and independent Parliament. His belief is that the best results to be accomplished by a Home Rule Parliament could be obtained as surely and more safely by the working of his devolution theory, the theory which would establish all over Ireland local municipal bodies for the full and free management of Ireland's business. This, of course, is a theory which the Irish Nationalist Party never could adopt, and I need hardly say that in this view I thoroughly

agree with that Irish Nationalist Party, among whom I worked for so many years in the House of Commons.

But, then, altho Lord Dunraven does not yet see his way to go the full length with us, I cannot help believing that he is gradually coming round to our views and our principles and that we shall before long be able to reckon him among professed Home Rulers. A speech which he delivered only a few days ago at a meeting in Manchester inclines me more and more hopefully to that expectation. But in the meantime it is quite certain that during the recent events in Ireland's history he has come to the front in a most remarkable manner and has become one of the most prominent and one of the most commanding figures in the momentous controversy. There is even some difference of opinion among Irish Nationalist members as to whether a fuller help might not have been judiciously given to Lord Dunraven's principle of devolution and whether the Home Rule movement might not have been helped rather than hindered by such a combination of forces. I am well aware that this is only the opinion of a small minority among the Irish Nationalists, but it is worth mentioning here if only to show that there is much yet to be expected from Lord Dunraven's influence and efforts on behalf of a final settlement of the great Irish National question.

Another member of the paralyzed Parliament on whom no touch of Parliamentary or other paralysis appears to have come is Mr. Labouchere. That distinguished and thoroughly independent member of the House of Commons has lately been delivering a speech in the representative chamber which for wit, humor, audacity and venturous repartee has surpassed anything even Labouchere has done for some time past. The speech was delivered in a debate on the introduction of a measure for the admission of women to the right of voting at Parliamentary elections. I need hardly say that the measure was introduced by a private member, as my readers are not likely to assume that any proposal for so progressive a piece of legislation could have come from the present Conservative Government. Mr. Labouchere was entirely opposed to any such reform, and he employed all his humorous faculties

and his ingenuity of satire to throw ridicule on what is called the emancipation of women and to strengthen by fresh and amusing illustrations the old familiar doctrine that women are best occupied when they are left at home to look after the house and to mind the children.

Now when I give praise to Mr. Labouchere's speech I may fairly claim to be regarded as an impartial critic, for my views on the whole subject of woman's emancipation are entirely opposed to those which Mr. Labouchere expressed in his own peculiar vein. But I cannot help admiring a really clever speech when I hear or read it, and I cannot but admit that Mr. Labouchere's speech was really most original and amusing. When I say that the speech was original I do not mean to say that there was anything like originality in the arguments it contained, for Mr. Labouchere brought out only the ancient and familiar arguments for compelling women to keep to what our venerable forefathers were accustomed to regard as the proper and the only business of womanhood. But it was in the originality of his illustrations, in the genuine comic force with which he dashed off a sarcastic epigram and the ready wit with which he replied at once to some disparaging interruption that the power of the speech consisted, and I could not help admiring these qualities in themselves, however perverse may have been their application. The proposed measure was, of course, not carried. Mr. Labouchere has, I believe, for some time ceased to be a regular resident of London or any part of England and has set up a home in delightful Florence. But he comes over to this country very often to fulfill his duties as a member of the House of Commons, and there is always a large attendance of members when it is known that Labouchere is about to take part in the debate. He has always been independent and has often been somewhat eccentric in his opinions and has never been a pledged supporter of any Administration or of any political party. To use a somewhat colloquial phrase, I may say that no one ever quite knows where to have him. But, on the other hand, every one knows quite well that when Labouchere rises to speak he is sure to say something worth listening to

and he never proved his capacity in that way more effectively than in his speech the other night on the political emancipation of women.

My American readers will be interested in knowing that there is to be during the June of this year an organized celebration of the thirty-fifth anniversary of Charles Dickens's death. There is in London an association called the "Dickens Fellowship," of which the official organ is *Household Words*, the weekly magazine founded by the great novelist. The president of this association is Mr. Henry F. Dickens, K. C., sixth son of Charles Dickens, and the society has a number of vice-presidents, among whose names will be found those of many of the most distinguished men and women in literature, art, science, the drama and political life. The names of several of the Dickens family appear in this list. It also includes the names of Sir L. Alma-Tadema, the distinguished painter; W. P. Frith, another Royal Academician; Algernon Charles Swinburne, Lord James of Hereford, W. Moy Thomas, J. M. Barrie, T. P. O'Connor, Sir Henry Irving and many others of distinction. We have in London a publication called *The Dickensian*, described on its title-

page as "A magazine for Dickens lovers," edited by B. W. Matz, which devotes itself to monthly articles dealing with Dickens and his work and his fame, and liberally illustrated by drawings depicting streets and countrysides and buildings described under fictitious names in the illustrious novelist's stories. The editor of *The Dickensian* intends to make his June number a memorial of the coming demonstration, and I think that memorial number may reckon upon a very extensive and indeed a world-wide circulation. I shall be much surprised if a few copies of that number do not find their way into New York and a good many other cities of the United States. The influence of Dickens throughout his native England and throughout all countries where the English language is spoken is not in any sense diminishing as the years go on. We do not stop to criticise him now as we might have done while he was still living and working in our literature. We take him as he is and we recognize in him one of the greatest and most enduring forces in the prose literature of modern England, as one of the novelists who are "a possession forever to all generations of men."

LONDON, ENGLAND.

## Is the Arts and Crafts Movement Degenerate?

BY MARTHA S. BENSLEY

[Miss Bensley is a young woman who dares to flout the fashion and has ideas of her own, as the following article attests, and being an artist herself, and even a faddist (she lives by preference in a rented tenement in the slums), her views cannot be refuted on the ground that she does not know what she is talking about.—EDITOR.]

ONE of the surprising developments of recent years is the revival of the handicrafts in this country. The *Bulletin* of the Bureau of Labor for November, 1904, reports the progress of hand industries in nearly one hundred centers in twenty-five States.

This activity is viewed with complaisance by several different classes of people. Those interested in art believe that it will destroy the ugliness of our

material surroundings; the wealthy welcome hand products as distinctive possessions which their money will command, while some economists see in it the commercial independence of the laborer.

Therefore, the making of things by hand, instead of retaining its proper place in our civilization, is pushed to the front; it gets a new name; it is called the Arts and Crafts Movement, and ceases to be thought the disagreeable primitive neces-

sity which it is in itself. It seems no longer a makeshift without intent or permanence; it has a special pedestal assigned to it, and seems to subserve those artistic interests which in reality it troubles. It is directed into the channel of industry, and is made to become the very staple of art as held in honor in our unenlightened day. In truth it is become the safeguard of stagnation, the guaranty of reaction, in the society which takes it for a household god. It inspires its devotees with scorn of the machine and stultifies the appreciation of mechanical perfection on the one hand, while on the other it makes the means by which a thing is produced of greater value than the thing itself.

Of the several reasons given for this revival the one that comes most to our ears is that machine made things are ugly and cheap. William Morris cries out against "the great revolution in the production of wares, which this century only has seen on the road to completion, and which on the face of it, and perhaps essentially, is hostile to art."

He and his followers say that cloths dyed by aniline products in the factories have no beauty; that the colors are not permanent as are the vegetable colorings, nor the fabric as durable as that made by hand. They claim that factory made furniture is ungraceful in shape, made of poorly seasoned wood, badly put together, and upholstered in leather so finished that it rots, or with tapestry that is garish and cheap and which offends the eye. According to them, the pottery commercially produced has no distinction, no individuality; the machine made baskets are fragile, the machine wood-carving coarse, the bookbinding inappropriate and inconvenient, the printing poor and hard to read, and the iron work vulgar tho ornate.

This charge of ugliness and cheapness can be easily answered even while admitting that it is true. Fabrics made by machinery can be as easily dyed with vegetable dyes as can hand made cloths, and every year the less expensive aniline dyes are made artistically more beautiful and chemically more permanent. As for the quality of the fabric, any one who will examine without sentiment and without prejudice the linen and homespun

made by our grandmothers will see the unevenness of the threads and the irregularity of the surface. These cloths are beautiful in spite, not because, of the fact that they are hand made. Some have claimed that the machine made linen is less stable than that made on hand looms because the size used in the factory causes the threads to break. But why need the factory use size? It is not a necessity of manufacture.

Some factory furniture is undoubtedly ungraceful; none of it need be. A beautiful design is as easily followed by a machine as an ugly one. Machine made furniture can be made of well-seasoned lumber as easily as can that made by hand. As for the putting together, a factory can refrain from poor glue as well as a man, and a machine can make and drive the wooden pegs which are said to be better than nails as well as any individual. Individuality and distinction may perhaps be lost by the mere fact of infinite reproduction, but beauty need not be, and our wares can be as lovely in shape and color even tho a thousand drink from cups of the same shape. When they are ugly, not the machine, but the design is at fault.

The machine is not to blame; if it does not do the work as well as a man it should be improved, not abolished. As an example of the power of the machine for beauty, the first wood engravings used as book illustrations were crude and less beautiful than the illuminations, but they were not abandoned and the hand product substituted for them on that account. Rather, they were improved; the engravers became more skillful in making the plate—the pattern—and the machines for the printing were perfected till the wood engravings were more beautiful than the illuminations and far less costly. This in turn has been superseded by more and more perfect modes of reproduction, till the beautifully illustrated volume is within the reach of all. But here again is heard the retrogressive cry of the craftsman, as doubtless it rang when illuminations went out of vogue. Reginald Blomfield says:

"The custom of getting illustrations from painters has led to the invention of all sorts of mechanical processes in order to transfer easel work direct to the printed page. The effect of

this upon book decoration has been deadly. Process work of this kind has gone far to kill wood engraving."

Why should not wood engraving be superseded by something better if its extinction was a condition of progress? As well mourn for the five-toed horse! In this case the machine by putting itself more and more between the hand of the artist and his completed work has raised a craft to an art.

As the chief tenet of the Arts and Crafts enthusiasts is that machine-made things are ugly and unserviceable, it is certainly fair to expect that hand-made things, and especially their own productions, shall be both beautiful and useful. At a recent Arts and Crafts exhibition of pottery, where the entries were passed on by an arts and crafts jury, there were a large number of so-called jugs and vases which were only useful to look at. They were doubtless beautiful in color and shape when any desire for use was entirely eliminated from the mind, but many of them were so narrow at the mouth as to make it difficult to get water into them and to preclude all possibility of their either holding flowers or being washed inside.

"Look," said I to a dealer in china, "at the figure on the bottom of this plate; it isn't in the middle."

"I know," he said; "but then it's hand work, and if it was perfect people wouldn't buy it—they'd think it was machine made."

"The border around this doesn't match at the corners," I told a friend who proudly showed me her book-plate.

"Yes, that's true," she replied; "but it just shows it's done by hand."

"How much of the carving on this cabinet is done by hand?" I asked the proprietor of a shop where they make reproductions of old hand-made furniture.

"Well, most of it is done by machinery," he admitted. "A machine can copy the old designs better than a workman, and we just have the surface finished by hand to get the marks of the tools and make people think it's all done that way."

These things would seem to prove that it isn't the perfect product that they

want. But do we forgive imperfections simply because they show hand work? Is the means used so much more important than the thing produced?

Unquestionably there is a demand for this hand work. The moneyed class demands something distinctive and unusual; it can pay for its fancies, and its desire is for something exclusive. Now this very phrase is its condemnation, for a thing to be exclusive must exclude. But these people who advocate the employment of hand labor do not admit that their object is to produce a costly product for the use of the few. They base their claim to consideration on the theory that their products contain more beauty than those of the machine. Sometimes, however, the real facts appear, as in this extract from a paper on Embroidery, by Mary E. Turner, a member of the London Arts and Crafts Exhibition Society. She says:

"Many things combine to make embroidery as fine as that of the past difficult of production, and there is nothing more against it than machinery, which floods the market with its cheap imitations, so that an embroidered dress is no longer the choice and rare production it once was. The machine-made imitation is so common and so cheap that a refined taste, sick of the vulgarity of the imitation, cares little even for the reality. When will people understand that the more ornament is slow and difficult of production the more we appreciate it when we have got it; that it is because we know that the thought of a human brain and the skill of a human hand went into every stroke of a chisel, every touch of a brush, or every stitch placed by the needle, that we admire, enjoy and wonder at the statue, the picture or the needlework that is the result of that patience and that skill; and that we do not care about the ornament at all, and that it becomes lifeless always, and often vulgar, when it has been made at little or no cost by a machine which is ready at any moment to produce any quantity more of the same thing? All ornament and pattern was once produced by hand only; therefore it was always rare and costly and was valued accordingly."

There is but one interpretation of a statement of this sort—it means that we value statues, pictures, tapestries and all works of art, not because they are beautiful, but because they are hand made. According to this the only test of beauty would be the amount of work put on it; the more work the more beauty. If this

were true, and Raphael had painted a thousand Sistine Madonnas instead of one, we should not care for any of them. But in reality beauty is an intrinsic quality; it has to do with quality, not quantity, and singularity is no characteristic of it.

These Arts and Crafts people also claim that each article should be made by one definite person for another definite person, thus insuring a harmony of design and use. Inveighing against the organization of modern industry, Walter Crane says:

"The very producer, the designer, and craftsman, too, has been lost sight of, and his personality submerged, so that we have reached the *reductio ad absurdum* of an impersonal artist or craftsman trying to produce things of beauty for an impersonal and unknown public—a purely conjectural matter from first to last."

This shows how far aside from the conditions of modern production is the ideal of the Arts and Crafts people; they do not even attain it themselves when they sell their wares to the casual purchaser.

It is, of course, true that the conditions under which any given piece of work shall be seen must be considered in the making; but in our modern city life how similar are thousands of conditions! One flat differeth not from another flat in glory.

Another condition aimed at in the production of harmonious articles by the Arts and Crafts advocates is that the designer and maker should be one. T. J. Cobden-Sanderson says of bookbinding:

"The work as a craft of beauty suffers, as do the workmen, from the allocation of the different operations to different workmen. The work should be conceived of as one and be wholly executed by one person. It is the original work of an original mind working in freedom simultaneously with hand and brain and heart to produce a thing of use, which all time shall agree ever more and more also to call a thing of beauty."

So this ideal bookbinder must fold the sheets fresh from the press, sew them together, glue the back to the boards, put on the leather and finally ornament the whole with a tooled pattern of his own designing. This product should be harmonious throughout; should have a

subtle feeling permeating it which the machine-bound book lacks, and from the mere fact of being made by hand, the product of one heart and brain, should give a pleasure to the user far beyond what the mere wood-paper-cloth combination would warrant.

But wait! Are there no jarring notes in this symphony? Are there not several things in this book which are the products of other brains, hands and hearts? Why stop at the mere binding of the book? If beauty is produced by the binder sewing the back, more beauty would be produced by his raising the flax and spinning the thread he uses. If harmony is increased by his gluing and tooling the cover, should he not also cure and dye the leather he uses, and also raise, feed and slaughter the animals which provide the skins? Should he not mine the gold for the decoration? If he does not, will it not mar that subtle effect he is striving to produce? Then, too, he should design, cast and set the type, make the paper, make the illustrations, and, above all, write the book! Therefore, to produce a really perfect book the author, Mr. Howells, for instance, must combine the varied professions of paper maker, typesetter, gold miner, cattle raiser, butcher, tanner, flax farmer, designer, illustrator, bookbinder and many more. If a little hand work is good, more hand work is better, and then there would be no occasion for the plaint, "Of the making of many books there is no end!"

This indefinable something which we are led to expect in hand work, this harmony which is to distinguish it from the product of the machine, has no necessary relation to the means of production. It is in reality only a combination of beautiful design and good execution, and the right machine can give more perfection in execution than the human hand.

The true field for the artist in the crafts is as a maker of designs for the machine to execute. We cannot afford that each man shall be at liberty to produce things after his own design, good or bad. If he can make only bad designs they should not be carried out, and the man that is capable of the good design should not waste his time in construction. If he does the community runs

the danger of losing other good designs, and good designers are, and must always be, rarer than good workmen. In just so much as this new movement is based on a search for what is new in art, on a longing for variety, as it is a making of patterns for the machine, a series of experiments, just so far is it good. But an industry which has as an aim only the production of a series of patterns, without ever getting to the construction of the things themselves, is an absurdity.

Of the numerous centers of hand production mentioned in the United States report by far the larger part were started by charitable organizations or individuals, and many of them are still supported wholly or in part by others. The demand for their products is in general artificially stimulated and dependent partly on philanthropy. This is especially true of the various textile industries, such as the making of carpets, rugs, bed covers and hangings. The character of these societies is clearly shown in their titles, as: Philadelphia Society for the Employment and Instruction of the Poor, and The Philadelphia Society of Art Needlework, to Provide Employment for Gentlewomen. This demand, therefore, is not a legitimate commercial one; it has no relation to the market and will certainly die as soon as its artificial support is removed.

It is also claimed that the workmen themselves are desirous of returning to hand work. This claim is not advanced by the artisans themselves, but by other people who are anxious for their welfare. The bad conditions existing in factories and the long hours of labor are given as reasons. Now the various labor organizations have discovered that it is only in the factories that the best conditions can be given, that light and air and decent conditions can be insisted on. In the factory the conditions as well as the price of labor are absolutely in the hands of the laborer; but these hand industries are carried on mostly in the houses of the various workers, where no supervision can be had of the hours of work, the age of the workers or the sanitary conditions. This is exactly the condition which has been fought under the title of the sweatshop, but when managed by the Arts and

Crafts societies it masquerades under such names as the Fireside Industries and the Household Guild. It is the same question that has been thoroughly thrashed out in relation to the making of garments in our cities, and that it now reappears in the rural districts does not change the nature of it.

It is sometimes argued that to do one thing continuously is narrowing; that the broader and more varied a man's occupations and interests the more perfect is his development and the greater his value. If this is true, then the solitary primeval savage, our overworked progenitor, was more perfectly developed and of greater value than any modern man. He must do every part of everything that was done. If we climb up far enough into our ancestral tree we find the ideal worker with the hands, the man who had nothing but his hands to work with. Unfortunately he only existed in his pristine purity at the stage when the hand was just beginning to be divided in use from the foot. As soon as the hand fully arrived progressive man discovered substitutes for it and got other men to help him use them.

There may be some truth in the idea that there is more pleasure in making the whole of a thing than in making a part of it; more joy in making a chair from the first smoothing of the rough timber to the final polish on the back than in only fitting the tapestry over the upholstered seat. But if this is so, it, too, is due to another primitive idea, that of independence. Many people mistake their distaste for the domination of another mind for their ability to work and think for themselves. In reality insubordination is not genius; it is not even pre-eminence; it is merely a lack of development. The really independent man ceased to exist ages ago; he vanished with the beginning of community life. We, his descendants, are not yet perfectly fitted to co-operative existence, and tho we are practically interdependent and would not know how to be anything else, we still indulge in that form of ancestor worship which keeps the independent man as a cherished ideal. William Morris himself answered this plaint that there is no pleasure in co-operative work when he says:

"The special limitations of the work should be a pleasure to you, not a hindrance. If you are hampered by the material you are working in instead of being helped by it, you have so far not learned your business any more than the poet has who complains of the hardship of writing in measure and rime."

The machine has become a limiting condition of manufacture, and unhappiness in its use simply shows that the workman does not know his business.

A man—one man—in a community, making things by and for himself, is an economic disease, as one cell, producing bone outside the regular, authorized bone-producing tract, clogs the circulation and becomes a center and cause of stagnation. This man working alone at any industry is the natural rival and enemy of all the others engaged in the same trade. The same man working at the same industry, but performing some special part of the general production, is the natural friend of the men with whom he works. Men are united, not divided, by the specialization of modern industry. That it takes an army of men to make one silver fork, unites, not separates, them. Industrial unity is impossible among men who are commercially independent. Economic dependence is the condition of our civilization and we should only progress backward by fighting against it

The so-called failures of machinery are simply due to its undeveloped state, to the fact that it is still too much an aggregation of hand tools not yet enough centralized. Why should the manufacturer's machines be condemned and the craftsman's tools be tolerated? Has the needle which embroiders the fabric virtue, and the five thousand horse-power loom which weaves it none? Is the wood-carver's knife the servant of art and the buzz-saw its enemy? Beauty is indeed a puny thing if steam or electricity can kill it! The hand and brain and heart are as intimate-

ly concerned in the use of these larger tools as with the simpler ones. The only difference is in favor of the more intricate mechanisms, for there the man rises more surely above the material he uses, its difficulties are more easily overcome, its possibilities more varied and more easily realized.

As an archeological investigation this Arts and Crafts Movement may have a value; as a phase of modern industry it has none, and should be called by its proper name—retrogression. The handicrafts once represented the best mechanically and artistically which the age could produce, but that age has long gone by. Their reappearance is based on conditions which are transitory; on the competitive system among manufacturers; on the incompetence of the designers who make patterns for the machine; on the demand of the rich for exclusive possessions, and on the backwardness and ignorance of the artisan, which make him submit on the one hand to bad conditions of production in the factory and, on the other, rebel against co-operative occupation. All these things can and will pass, and perhaps the only legitimate function of the handicrafts is to hurry this transition, and with it their own extinction.

The tool, the machine, has made our civilization; has disseminated our art; has come near to freeing the laborer. Machinery is good—all of it! The nearer we come to that ideal point where we can press the button and the machine will do the rest the better for art as well as other things. Man grows through what he makes, and in working with his fellows to make beautiful things for a world of men he will grow more than in working by himself to make a thing for a man. The man and the product are one, and the measure of our civilization is the increasing victory of the machine over work with the hand.

## A Modern Prophet

MR. H. G. WELLS'S visions of the future have taken two forms; he has written one series of awful warnings and one of hopeful anticipations. The most important stories of the first series are "The Time Machine," foretelling the separation of mankind into two sub-species, a brutalized working race and a leisure race, living only for pleasure, "When the Sleeper Wakes," in which he warns us of the absorption of all capital in a single world trust, and "A Story of Days to Come," when the inhabitants shall live in gigantic cities, where the noise, hustle, competition and intensity of life are a hundred times greater than they are now.

But just as the higher critics have divided Isaiah into two prophets, so we must distinguish between the works of Wells<sub>1</sub>, the Pessimist, and Wells<sub>2</sub>, the Optimist. The latter has also given us three volumes, more serious in form, depicting the society of the future as it will, or at least as it might, be: "Anticipations," "Mankind in the Making," and *A Modern Utopia*.<sup>1</sup>

He has rightly called it "Modern," for he has introduced several novelties not found in utopias of his predecessors; among them may be mentioned a greater degree of privacy, of personal property, of freedom of locomotion and of choice of occupation. He introduces machinery as the modern substitute for the slave labor on which Plato's republic was built. He also brings in a personage who has never before appeared in a literary utopia, but who will certainly be found in any utopia which shall be realized upon this earth—namely, the chronic kicker, a man who objects to all regulations and improvements and wants to go back to the good old times (our present), when everybody lived natural, free, wholesome and happy lives.

Mr. Wells divides mankind into four classes: The Poietic, who are men of

original genius, tho often erratic in temperament, endowed with imagination, the class from which come the great scientists, artists and religious leaders; the Kinetic, the men of ability, business men, administrators and efficient workers of all kinds; the Dull, who are capable only of imitative and routine work, and the Base, those whose tendencies are toward evil and whose existence is a detriment to the State. For everybody work of some sort is provided and a minimum wage guaranteed, but those who do not earn more than this are debarred from marriage and other privileges. For criminals there are islands to which they are banished, each with his own kind, where they may live together free from external interference, in such peace and happiness as they are capable of attaining. On one island the chronic drunkards may live in one continual spree, and on another the incurable cheats may practice frenzied finance to their hearts' content and live by fleecing each other.

The difficulty with all utopias is that such a complex, systematized and well ordered social machine could not be managed by ordinary men. This objection Mr. Wells acknowledges with his customary frankness, and meets the difficulty by conceiving his socialistic state as an aristarchy, controlled by a class of "voluntary noblemen," called the Samurai, an order of noble-minded, public-spirited and efficient men under somewhat ascetic discipline and with a morality and code of honor of their own. Both the Samurai and their "Bushido" are, of course, suggestions from feudal Japan. Mr. Wells says:

"In the case of a utopia one assumes the best possible government, a government as merciful and deliberate as it is powerful and decisive."

But if we had this we would not need to worry about the forms of government, anything would do, even the Russian bureaucracy, and until we do get such a government Mr. Wells's brilliant theory will remain "an iridescent dream."

<sup>1</sup> A MODERN UTOPIA. By H. G. Wells. New York: Charles Scribner's Sons. \$1.50.

The form he has chosen for *A Modern Utopia* is exceedingly unfortunate, the sudden alterations from argument to romance and from earth to the distant planet are as distressing, to use his own simile, as watching kinetoscope pictures when the light flickers. The essay appended, a criticism of formal logic from the standpoint of the modern scientific conception of the uniqueness of the individual, is a contribution of real value to the theory of thinking and written in a style as witty and original as that of Professor James.

That Mr. Wells has not entirely abandoned the field of the fantastic short story, in which he made his first reputation, is shown by the appearance recently of *Twelve Stories and a Dream*.<sup>2</sup> None of them is equal to the best of his former tales, but there are some that are very amusing and some quite gruesome. "The Dream of Armageddon" is in Mr. Wells's "earlier manner"—it is a vision of a pleasure city in Capri, whither the rich go to spend in riotous living the money they have wrung from the wage-slaves; it is a preliminary sketch to "When the Sleeper Wakes."

## Thackeray in the United States

THACKERAY made two visits to America, three years apart, each of about five months' duration. He came for money—"shekels for his girls," as he frankly admits in various letters. The money was fairly earned, jubilantly received and acknowledged with a sly twinkle of satisfaction in the fact that he was getting a gentle revenge for the loss of copyright—a sort of royalty on pirated books. Like Matthew Arnold and Charles Dickens, he watched the inflow of shekels with rejoicing—shouted and danced, says Mr. Fields, when he was told that the tickets to his first course of lectures were all sold, and, as he rode to the lecture hall, "insisted on thrusting both his long legs out of the carriage window, in deference, as he said, to his magnanimous ticket holders."

<sup>2</sup> TWELVE STORIES AND A DREAM. By H. G. Wells. New York: Charles Scribner's Sons. \$1.50.

\* THACKERAY IN THE UNITED STATES. By James Grant Wilson. With six score illustrations and a bibliography by Frederick S. Dickson. In two volumes. New York: Dodd, Mead & Co. \$10.00.

And the compliments went with the dollars. Wherever Thackeray journeyed he made himself welcome by his splendid big-boyishness and joviality. Seen at the best tables were his homely, beaming face, his humorous large eyes under large spectacles, his broken nose, the bridge of which his eyes never crossed without comment on the imperfection of the girders. It may be supposed that the observer at our Vanity Fair saw whatever was droll, raw and uncomfortable. Some of this comes out in Mr. Wilson's two large and handsome volumes, in the innumerable notes and notelets, in the somewhat motley collection of anecdotes, squibs, dinner-table talk, "impressions" contributed by admiring handshakers.

But Thackeray was faithful to his promise not to write about us unkindly for the public. If he was ever tempted to do so he "had it out with himself," one would suppose, making a wry caricature of his own face. Making faces of himself and at himself was one of his greatest charms. The two volumes are full of these variations, drawn in the Punch vein, or perhaps in the Punch and Judy vein.

In the best company also he sang his "Little Billee" and "Larry O'Toole," getting in return as good as he gave—probably better in the purely musical line—from the sentimental songs of Curtis, the lively Irish melodies of Judge Daly and the plaintive humor of Christopher Cranch. He ate large oysters, "the gentle substance of that marine concretion," with "Sam" Ward, some of the bivalves being "big, like babies," which he "swallowed gratefully," altho he rejected one "because it resembled the High Priest's servant's ear that Peter cut off."

More than the oysters, he enjoyed (without eating) the small boys, whom he always "tipped," if he dared; and the ladies, who were all beautiful, one of the prettiest being found in Philadelphia. Naturally he complimented her on her beauty, and very naturally she turned around delighted, to say to a friend: "Ai most tellat." He sees a young Quakeress at his lecture:

"Lord, Lord, how pretty she was! There are hundreds of such everywhere, airy-looking little beings, with magnolia, no, not magnolia—what is that white flower you make bouquets

of?—camella, or camelia complexions, and lasting not much longer."

He finds a second Beatrix in New York, and a slim, tall, brilliantly beautiful American girl, from whom he will probably model his Ethel Newcome. "I can't live," he says, "without the tenderness of some woman, and expect when I am sixty I shall be marrying a girl of eleven or twelve, innocent, barley-sugar loving, in a pinafore." His death, occurring eight years before that age had come to him, delivered him from that temptation.

American readers will find in these two volumes nothing to complain of, everything to correct an ancient notion we all had that Thackeray was cynical.

### Stories of the Human Springtime\*

NOTHING in history is more remarkable than the recurrent stages of youth through which the world passes. The Egyptians, Greeks, Romans, Jews, all grew old with their gods and philosophies. But wherever there has been a revival of religious spirituality in any vital form there has been a return of childhood and simplicity to the hearts of men. They discard the learning of a hundred centuries, go back to the primer view of things, and work up once more through their illusions to the old age of realities. Thus Isis passed, and Jupiter, and Moses and the prophets, giving place to Christianity and to another period of youth in the mind and spirit of the times. Now, Mr. Hewlett has selected this human springtime of the Middle Ages for the scenes of the *Fond Adventures* which compose this volume.

Then, War was the god, and Love was the mistress of the world, Religion was beginning over again, a mere matter of vows and taper-burnings, learning was as much a dalliance as loving, and might consist in writing verses to a lady's eyes or in making a treatise upon such subjects as "Why the extremities of lovers are at one time hot, and at another cold," or "Why the bearers of loads sing as they go," or "Why insects die in

oil." Science was a romance then and love the only reality. We have lost the very vocabulary of the time, but that which renders Mr. Hewlett a master at interpreting the personality and spirits of it into fiction is the fact that he makes a medieval use of modern terms, restores to some words, which we have long used to express the uninspired realism of passion, their youth and innocence, and blows them up into delicately amorous phrases more becoming to the ideality of love, and he has inhouseed them all by a naïve humor, a smiling light which shines from every page. But that which peculiarly distinguishes him is the gallantry of his mind in dealing with the fierce virgins and brave knights of the times he has chosen. Nothing, for instance, can be more suggestive of flesh and blood, or of that fire element of pagan poetry (which the modern heroine no longer possesses), than his Lady Sall, heroine of "The Heart's Key."

"She was the elder of the two, and more superb, a golden lady with long yellow hair, like Helen's, of Troy, and of fierce face like a Siren's when she has drowned a man . . . her gown was white, of thin silk, which fitted her so closely as to be a man's despair to show how glorious she was and how remote. . . . Round her waist was a very broad girdle of gold, plates of gold riveted together with hinges and stuck with sard and emeralds of the sort they call the 'Heart's Key,' the girdle which virgins must wear until they are wedded."

Maidens really look now as they did then, and the difference is not so much in the drapery as it is in the different, mere mantuamaking use of words.

And the medieval mixture of good and bad in a man was not, according to Mr. Hewlett, the dull compound it is to-day. There never was a more engaging villain than this "Brazenhead the Great," and this description of him, how it fits in with some long forgotten youthful demand of the imagination:

"I have spoken of his leanness, of his inches, of his thirst. It must be added that he was plentifully forested with hair, which drooped like ivy from the pent of his brows, leaped fiercely up from his lip to meet the falling tide; gave him a forked beard, crept upward from his chest, to the light of his throat; had invaded his ears and made his nostrils good cover for dormice in winter. . . . I might

\* FOND ADVENTURES. By Maurice Hewlett. New York: Harper Bros. \$1.50.

sing of this. . . . I prefer a pean to his nose. . . . An heroic nose, a trumpet, an ensign built upon imperial lines; broad rooted, full of gristle, ridged with sharp bone, abounding in callus, tapering exquisitely to a point, very flexible and quick. With this weapon of offense or defiance he could sneer you from manhood's portly presence to a line of shame, with it comb his mustachios. When he was deferential it kissed his lip; combative, it cocked his hat."

Who else among modern writers makes such a witty and audacious appeal to that imagination which hatched the goblin fancies of our childhood? He makes an art of absurdity.

But it is "The Love Chase," the last story of the series, in which Mr. Hewlett probably surpasses anything he has ever written. A review can give no adequate impression of the elements which go to make this a masterpiece in fiction. In his description of "Nello Nelli," the young humorist who found himself strangely misfitted in ethics of that Italian springtime of the fourteenth century, and even more strangely fitted to it in temperament, there is a mixture of poetry, satire and genial fancy that is as captivating as it is rare.

### Justin McCarthy's Autobiography

MR. JUSTIN MCCARTHY in 1899 published two volumes of his "Reminiscences." It might be conjectured that he had little more to tell, but a reading of the first fifty or sixty pages of his new volume, *An Irishman's Story*,\* soon disposes of any such supposition; for it is quite distinct from the "Reminiscences" and has an interest peculiarly its own. It is the story of Mr. McCarthy's busy life from the time he began work as a reporter on the *Cork Examiner* at the age of sixteen or seventeen to his retirement from the staff of the *London Daily News* and from the House of Commons in 1900.

Readers of THE INDEPENDENT need not be told that when Mr. McCarthy left Fleet Street and Westminster for his present home at Westgate-on-Sea he did not abandon literary work. He has written half a dozen books since then—fic-

tion, history and biography, and each month THE INDEPENDENT is favored with his interpretations of the movements in English politics and with his views on what is new in letters and art in England. Mr. McCarthy obviously takes pleasure in these letters for THE INDEPENDENT. Except for an occasional review for the *London Daily Chronicle*, they are the last tie Mr. McCarthy has with journalism—with the work in which he has been so eminently successful—and they continue a connection with THE INDEPENDENT which dates as far back as 1868, when he made a visit to this country which extended over two years, and when, as he recalls in the present volume, he was welcomed to a desk in the editorial rooms of THE INDEPENDENT and wrote articles on the political affairs of England, and gave his advice and suggestions on subjects of European interest.

This American visit of 1868-70 is a landmark in Mr. McCarthy's journalistic and literary career. He came here fresh from the editorial chair of the *Morning Star*, a London daily journal with which he had been connected since 1860, and where his work had brought him into close contact with Cobden, Bright, Lucas and other Radicals who had upheld the cause of the North in London. He had succeeded Lucas as editor, and when he came to New York his place was taken by Mr. John Morley. His desire to be active in the Irish cause took him back to London, where from 1870 until 1900 he was continuously of the staff of the *News*, for his work as a historical writer and a novelist, and his active connection with the Irish Nationalist party from 1879 to 1900, when he was of the House of Commons as member for Longford and Derry, did not entail any break in his work as a political leader writer for what was then the most dignified exponent of Liberalism in England.

Mr. McCarthy had long had a place at the editorial writers' bench in the Press Gallery at Westminster; and when he was elected member for Longford and moved from the Gallery to the green benches below he only added to his already arduous work as a journalist the then more exacting duties of an Irish Nationalist member.

\* AN IRISHMAN'S STORY. By Justin McCarthy. New York: The Macmillan Company. \$2.50.

His work brought him into pleasant contact with men prominent in various departments of life in England and Ireland as well as in this country and on the Continent of Europe, and it is with his relations with statesmen and politicians, journalists, authors and publishers that the greater part of *An Irishman's Story* is concerned.

The columns of THE INDEPENDENT are the last place in which any stress need be laid on Mr. McCarthy's amiable style. It is characteristic of this book, as it is of all Mr. McCarthy's writings, and from first to last these autobiographical chapters have a charm, from the fact that they suggest that Mr. McCarthy has always met the world with a good heart and a kindly face, and that the world in his case has never failed to respond to his attitude toward it.

**Jörn Uhl.** By Gustav Frenssen. Translated by F. S. Delmer. Boston: Dana, Estes & Co. \$1.50.

This book is not likely to attract the ordinary novel reader, who wants to be carried breathlessly onward by an unbroken series of exciting incidents or equally exciting epigrams. It is a leisurely story of German country life, written by the pastor of a remote Holland parish, who had time to observe the life around him and time to find just the right words to describe it. It is a story of the Gothic order of architecture, irregular, complex, with curious carvings and unexpected gargoyles. The description of the battle of Gravelotte reminds one of Zola's picture of Sedan; some of the descriptions of a lonely lad's thoughts are like Sudermann's in "Dame Care." Americans will not grow as enthusiastic as the Germans have over Frenssen, but there will be many who will appreciate it and recommend it to a few selected friends. The author may be congratulated upon having found such an inspired interpreter, who gives the essence rather than the mere meaning of the words. The translation shows remarkable poetic insight and is faithful rather than literal.

**Italian Backgrounds.** By Edith Wharton. Illustrated by E. C. Peixotto. New York: Charles Scribner's Sons. \$2.50.

Mrs. Wharton's title finds its explana-

tion in the longest of these essays, wherein she calls attention to realistic bits of landscape, architecture or every day life, which the Italian artists were accustomed to paint in the background of the conventional religious figures.

"As with the study of Italian pictures, so it is with Italy herself. The country is divided, not into *partes tres*, but in two; a foreground and a background. The foreground is the property of the guide book and of its product, the mechanical sightseer; the back-

Chiesa del Miracoli, Brescia. From Wharton's "Italian Backgrounds." Copyright, 1905, by Charles Scribner's Sons.

ground, that of the dawdler, the dreamer and the serious student of Italy."

It would seem impossible to get away from overdescribed places in Italy, but Mrs. Wharton is wonderfully successful at wandering in new by-paths and in discovering new shrines for the adoration of the artistic traveler. And even the streets, landscapes and pictures that are most familiar become again interesting as she describes their aspects under the varying conditions of weather, season, mood and circumstance. "Italian backgrounds" such as these she has already drawn in her novels, but they are interesting enough to form a book by themselves.

**A Rebel's Recollections.** By George Cary Eggleston. New York: G. P. Putnam's Sons. \$1.00. [Fourth edition.]

**Reminiscences of Peace and War.** By Mrs. Roger A. Pryor. New York: The Macmillan Co. \$1.50. [Third edition.]

The popularity of these two books of Southern recollections is attested by the several editions of each that have been called for. Mr. Eggleston's work first appeared as a series of papers in *The Atlantic Monthly* in 1874 and 1875, while Mrs. Pryor's dates only from last fall. The charm of the old Virginia life—that is, the life of the well-to-do planters—is admirably shown by both writers, but both are equally oblivious to the life of the "poor whites" and the negroes. For a picture of conditions during the war each book serves as a fitting complement to the other, Mr. Eggleston writing of the field and Mrs. Pryor of the life in beleaguered Petersburg and Richmond. There is strong and true pathos in Mrs. Pryor's recital of the heroism, the destitution and the suffering of the Virginia women during the closing months of the struggle, and in the light of this account one can well understand Mr. Eggleston's candid admission that he never knew a thoroughly "reconstructed" Southern woman. Both writers, it is worthy of note, dwell upon the constant blunders of the Davis administration, and tho there is no denunciation and but little direct criticism, the impression given of the head of the Confederacy is a distinctly unfavorable one.

**Poketown People.** By Ella Middleton Tybout. Philadelphia: J. B. Lippincott Co. \$1.50.

This collection of negro tales is well written, so far as clever reproduction of dialect and sprightly descriptions constitute good writing. The inhabitants of Poketown are presented to us under circumstances whose interest varies considerably, ranging all the way from the really clever concert of "The Offending Eye" to the trite and commonplace "Ananias, of Poketown," which is nothing more than the ancient theme—and it has not gained dignity with age—of regeneration accomplished in the youthful reprobate through the combined effects of an opportune thunderstorm and overindulgence in green apples. The sketches are amusing, so far as they go; they do not go far enough in that they are never anything more than amusing. When the public first laughed over "The Golden Wedding" and "Lamentations of Jeremiah Johnson," it yet laughed with eyelashes wet—and it keeps a tender memory for them to this day. Miss Tybout's stories will be laughed over (not very hilariously) once, and put aside, because they depict the negro's "eccentricities, superstitions, strange code of morality, and curious practical application of religion to everyday life" absolutely unrelieved by any other qualities. The point is not the ethical one of the injustice in painting the old-time negro without his redeeming features of affection and loyalty; it is the purely literary one that the book palls, because of the persistence of one unvarying flavor. The author professes to have been prompted to her work by "affection" for "the dark-skinned friends" of her childhood, but it is precisely affection which her sketches conspicuously lack.

**The Most Popular College Songs.** New York: Hinds, Noble & Eldredge. 50 cents.

The title of this book exactly fits its contents. Any one who has ever sung on one of the college glee clubs will recognize at least four-fifths of these songs. It is the best collection of the old "standbys" that we have yet seen.

# Editorials

## The Equitable Life Assurance Society

AN investigating committee composed of directors of the Equitable Life Assurance Society and appointed by the board has made a report in which substantially all of the charges heretofore brought to the attention of the public are sustained by proofs of the most convincing character. This report contained the severest censure of unfaithful officers, sharp condemnation of their use of the Society's funds for personal gain, and unsparing criticism of loose business methods. In a certain sense it was the board's confession of its own guilt. It recommended the removal of the three leading executive officers, who are also members of the board, together with a thorough reorganization of the management and a return to the principles which should govern the conduct of a life insurance company.

By a considerable majority this report was disapproved and rejected at a stormy meeting of the board; whereupon the most prominent members of the committee resigned. The censured officers remain in control. The board has virtually said that their acts do not deserve the disapproval expressed by its own committee. They are free, so far as directors' restraint is concerned, to continue the practices, unjust and probably unlawful, which both the committee and the public have denounced. Such is the situation which the 600,000 policy holders of this great fiduciary institution may justly regard with indignation and anxiety, altho the solvency of the Society has not been impaired and we are confident that their investments will be saved.

Complaint is made by both of the contending factions in the management that the Frick-Harriman report was not entirely impartial, that it was unduly severe with respect to some persons and offenses, but too lenient or

even silent with respect to others not less censurable. It seems to us that the committee's condemnation was not apportioned strictly in accordance with the magnitude of the offenses denounced. Still, the evidence cited shows that no one was unjustly accused in the committee's conclusions, or undeservedly presented for punishment. The punishment suggested, however, while apparently uniform, is in reality much more severe for two of the condemned officers than for the other; and the two deserve less than should be given to the third. If Mr. Hyde should retire from office, he still would control the Society, and the character of the board would still be determined by his shares of stock. Removal from office would be punishment much less severe for him than for President Alexander and Second Vice-President Tarbell.

Except with respect to its apportionment of censure and punishment for the offenses which it considers, the report, so far as it goes, is just in its severity. But it does not go far enough; it does not cover enough ground. We mean by this that its enumeration of the objectionable financial operations is incomplete; that it is silent concerning certain loans, syndicate transactions and sales of securities in which prominent and influential members of the board were profitably interested. Why were these omitted, after all with which Mr. Hyde and Mr. Alexander and two or three other directors were connected had been set forth in detail and denounced? Was it for the reason that a member of the committee itself was interested in them?

It might have been foreseen that the omission of such instances, concerning which the investigators ought to have expressed their opinion, would be cited as proof of the committee's partiality and as tending to support current theories as to the purpose of certain powerful financial forces to exclude com-

petitors in a contest for control of the Equitable's \$400,000,000 of assets and \$80,000,000 of surplus. It was in the omissions and silences of the report that its weakness was to be found.

Still, it was a just statement with respect to the offenses which it did enumerate and denounce, and the rejection of the whole of it was not only a blunder, but a distinct challenge to the protesting policy holders and the authorities. The Society cannot be permitted to remain in its present condition and under the management of the men whose perverted views of their duties and responsibility have thus been exposed.

It is not expected now that the committee appointed to nominate a board chairman with unlimited power will serve, nor is it probable that the election of such an officer would satisfy policy holders and the public. The recent decision in the Lord suit will prevent for a considerable time, at least, even such gradual mutualization as Mr. Hyde might permit. The resolution requesting Mr. Hyde to divest himself within three months of his stock control offers nothing tangible at the present time. What the public desires and what it should have is a thorough investigation by representatives of the people. Demand for such an inquiry has been stimulated not only by the committee's disclosures and the rejection of its report, but also by the failure of the State Superintendent of Insurance to do his plain duty in the case of the Society.

An investigation should be made by the Legislature of New York, which is soon to be called in special session to act upon the proved charges against Justice Warren B. Hooker. The removal of so unworthy a judge from the Supreme Court of the State is greatly to be desired, but the case of the Equitable is one of much larger importance. It is clearly the duty of Governor Higgins to lay this case before the Legislature and to ask for a searching inquiry. If Justice Hooker should now yield to the arguments of his friends and resign, this should not prevent the calling of a special session for such an

investigation. We hope to hear within a week that the Governor has decided to take this course.

## International Law and International Peace

THE Peace Conference at Mohonk Lake last week brought together a great number of distinguished men, and much wise speech was uttered during three days. Jurists, Congressmen, teachers of diplomacy and public affairs, business men and professional men all gave much and learned much, and they left their conclusions in a series of clear propositions. But to our mind there are two lines which such conferences can profitably give attention to. One of these is the creation of a public sentiment against war and in favor of peace, such a general sentiment as will impress and control rulers and legislators and make them unwilling to engage in war. The other is the careful formulation of the plans for settling difficulties between nations without resort to war.

The first consideration, that of creating a public sentiment, is for the public at large. It is for every man and every woman, and even for every child. Accordingly the platform gave particular attention to the education of the young. It recommended that in colleges and schools there should be instruction by lectures on peace and arbitration, and that students organize themselves into societies or clubs for study and debate on the subject. To the same end is the presentation of arbitration to boards of trade, some seventy of which took action last year, and half as many were represented at the conference. It is a matter of the first importance to develop such a public sentiment which will not regard war as glorious, but rather as deplorable, when it is not criminal.

The other task is for the wise men, for the rulers and legislators. They rest upon the conscience of the people at large; but it is their duty to remove the occasions for war, and to find its substitutes.

The occasion for war, at the last analysis, lies in the fact that there is no binding code of international law. Eng-

land and France differ, for example, as to the duties of neutrals, as we have learned from the hospitality given to the Russian ships at Saigon. Every difficulty between nations could be settled if the laws of nations were carefully formulated and accepted and there were then courts to decide whether the law of nations has been broken in any given case. At present we talk much of the law of nations, but it has no more binding force than any one nation may choose to give it. Each nation is a law to itself.

It is to this end that the conference of nations, which President Roosevelt has called, must devote itself. For this purpose an International Law Society was originated. It cannot all be done at once; it will take many years; but there will be a beginning. This will develop into an international Parliament, for legislation, just as we now have an international judicial court at The Hague. While the Mohonk platform recognizes this need and approves the work of the Inter-parliamentary Union, there does not seem to be much general expectation among the friends of peace that this international legislature will soon be organized. It is regarded as a dream to be realized in some far distant Utopia. But why should it be so long deferred? Who expected the Court of The Hague to come out of the Hague Conference? A few rainbow-chasers found to their own surprise that they had fixed fair Iris in solid arch on solid ground. And if the time was ripe then for a court of the nations, we need not be so much surprised if other—or the same—wise enthusiasts should persuade the nations to organize an international Parliament, to meet every five years, and make law for all the nations, as national Parliaments now make laws for their own nations. This is the next step and it may not be so far off. But the first great plan which such a Parliament will put into law will provide for a full system of arbitration. This is what is meant by the formulation of a general treaty of arbitration to be accepted by all nations. It is a great thought, and its adoption will be a great step forward.

This could be desired and approved

by the Mohonk Conference, but we are glad that the Conference did not take the suggested action to condemn the United States Senate for not ratifying the treaties of arbitration sent to it by the President. The difficulty which met the Senate was a Constitutional one, and it has some little weight. It might very well be regarded that these treaties provided for new treaties, as cases came up between "the high contracting parties," and that these would be real treaties, inasmuch as the "high contracting party" on the side of the United States must be the President and the Senate. The President alone cannot be a "high contracting party." But these were quite unsatisfactory treaties, and better ones can be formulated. What we want are treaties that do not exclude questions even of honor. Such a case was the treaty between Russia and Great Britain as to the settlement of the Dogger Bank attack on the fishermen by the Russian fleet. War was very near, and much honor was involved, even the honor of lives destroyed by the armed fleet of another nation. And yet the two nations chose arbitration rather than war. And this can be done at any time in any difficulty. Holland and Denmark have lately given us the ideal of such a nearly perfect treaty.

### The Rebirth of Russian Civilization

WHILE the world is spellbound with amazement at Togo's annihilation of Russia's naval power and is speculating upon the consequences of Japan's rise to a commanding position among the greatest nations it is well to reflect upon the happy outcome of these tragic events that is promised by all the laws of social evolution for the Russian people. As certainly as the future historian will date yellow supremacy in the Orient from May 27th, 1905, so surely will he date from the same hour the new birth of Russian civilization.

In all ages the finest flowering of civilization has followed upon military defeat and has been created by the defeated. Goths and Vandals overwhelmed the Russian Empire, but the arts, religion, laws and institutions of the de-

feated Latins conquered and civilized the conquerors. The empire of Plantagenet England across the channel was lost at Formigny and the energies of the people, no longer squandered in militaristic enterprises, blossomed forth in the intellectual splendor of the Tudor reigns. France, the home of science, philosophy and art, dissipated her genius in the Napoleonic wars, and Germany, devastated, humiliated, disintegrated, held for half a century undisputed leadership in the intellectual life of the world. At Sedan the tables were turned. Prussia became in her turn the military dictator of Europe. The German Empire, a veritable incarnation of militarism, was born. For a time the German university, by sheer inertia of intellectual life, maintained its liberties and its influence. But little by little its power has waned, and the great work in science and scholarship no longer comes from over the Rhine; while France, from a third-rate rank in science and letters, has in recent years advanced steadily to higher achievements, until now no one expresses surprise that the most revolutionizing discoveries ever made in the realm of physical science have come from the laboratories of Becquerel and the Curies.

The Russian people have qualities of temperament, feeling and intellect that fit them to become creators of superb and priceless contributions to the highest civilization. Already, in the works of men like Chernyshevsky, Turgenev, Tolstoy, Kovalevsky and Kropotkin, they have revealed a wealth of transforming ideas and sentiments that are full of promise for the ultimate solution of the most difficult problems of social reconstruction. For generations repressed, persecuted, exiled, Russian genius will henceforth work freely, and only the boldest imaginations can picture the outburst of creative activity that inevitably must follow the liberalizing of Russian laws and institutions.

The infamous tyranny of the Romanoff régime is nearing its end. The shameless cruelty, corruption and graft of the bureaucracy that has brought Russia to her present sorrow and humiliation will be swept away forever, and the healthy forces of a sound moral and intellectual life will henceforth control the

political activity of the nation. Disappointed in the dreams of her rulers, who sought to extend a militaristic empire over half of the eastern hemisphere, Russia will take her place among the great nations of the earth through supremacy in the arts and achievements of peace.

Russia through military defeat has lost only her bonds. They are sundered, and her mind and soul are set free. Japan, in military and naval triumph, has put in pledge the beauty, the simplicity, the joy of her wonderful Eastern civilization. Only by the exercise of a well-nigh superhuman restraint and wisdom will she redeem and further develop them.

### The Pleasures of Discomfort

MAN is distinguished from the lower animals and the civilized man from the savage by his disregard for physical comfort. Whether man always seeks his own pleasure or not is a good question for debate, because it is chiefly dependent upon the definition of the word pleasure, but if we limit pleasure to personal ease there is only one side to the question, the negative, for man casts such pleasure aside for a hundred reasons and for a thousand whims. "A spark disturbs our clod." Laziness is less in repute than most of the other vices. A man will leave his hearth fire to climb a mountain after a star or to stumble through bogs in chase of a will-o'-the-wisp. He will torture himself to please a vindictive god of his own imagination or make himself uncomfortable at the dictate of a goddess quite as fictitious, Dame Fashion. Whether wearing the hair shirt as a penance or the high collar because it is the style, he is happy because he feels himself uncomfortable.

For a variety of reasons man has come to have the feeling that it is improper to be comfortable. Our Puritanic ancestors saw in the liking for comfort a wile of the devil to make this world so desirable that man would cease to desire an heavenly abode. We have something of the same feeling, but for a different reason. We look with suspicion upon any custom, object or dress which seems convenient, sensible and desirable, because we are afraid it is not *à la mode*. This instinct is usually correct.

Mrs. Gilman on another page calls attention to many absurd articles of dress which have survived in spite of their inconvenience. This, however, is only half of the truth, for it is evident that in some cases they have survived or developed *because* of their inconvenience.

The reason for this apparent absurdity is plain upon a little consideration. There is a great delight in being well dressed. By "well dressed" of course we mean dressed in accordance with the prevailing fashion, however inartistic, immodest, inconvenient and ridiculous that may be. Our sartorial conscience, without whose approval we cannot be happy, is, like our ethical conscience, only a monitor to warn us of deviations from the established canons of modes and morals. Now it is not sufficient to be well dressed; one must feel that one is well dressed. There is no pleasure in unconscious sartorial rectitude any more than there is in unconscious virtue. We put large mirrors on the walls of our social halls in order to remind us that we have on good clothes, but a still more effective way of accomplishing this object is to make the clothes themselves uncomfortable, then we will realize we have them on.

One is not conscious of ease, of comfort; they are negative feelings. A sense of effort we have, but no sense of lack of effort, except as a change, a momentary sense of relief. In society we want to feel that we are making an effort to look well as a compliment to our friends. Gracefulness is unconscious, altho it may be the result of previous conscious and painful efforts. Therefore in society it is improper to adopt easy, natural and graceful postures, and for that reason we delight to feel our clothes rub, compress, distort and hamper us. Seeing our friends in similar uncomfortable clothes gives us pleasure, not because misery loves company, but because we feel it is a compliment to us that they should wish our society so much as to seek it under conditions of such discomfort.

Lotze, one of the few philosophers who has deigned to consider the important subject of dress, explains why the dress hat must not only be high but also hard and heavy. Its height is, of course,

to increase a man's imposing appearance, to extend his personality; but in order that the wearer shall realize this, and so derive enjoyment from it, the hat is so made and placed on the head that at every motion it makes its presence felt. It is natural that we should fall into the error of thinking that the more uncomfortable we are the better we are dressed. We come to think that stiff, tight, awkward, inconvenient, fragile and expensive clothes are always the best, and so we select a suit on the ground of its unsuitability. We soon get used to the discomfort caused by any particular article of dress, and then, of course, the fashion must be changed so we will be pinched in some other part.

The same principle explains the follies of Arts and Crafts faddists, which Miss Bensley exposes in this issue. That is why the crude, inconvenient and expensive hand-made products are more highly esteemed than neater, more convenient and cheaper articles made by machinery. When we see a heavy, awkward and uncomfortable chair in the house of a person who can afford to buy any chair he wants we think, quite unwarrantably, as every student of human nature will admit, that there is some good reason for it, even if we cannot see it, and we buy a chair like it. The artistic book is distinguished from the common primarily by its inconvenience. That is why it is made with uncut or rough edges, in an awkward shape and with type that is hard to read. All this is based upon the fundamental fallacy that whatever is costly must be valuable; that whatever we strive to get is worth striving for. Man is not usually willing to admit that he has been cheated, therefore he makes the best of a bad bargain and shows a commendable disposition to be content with discomfort.

## Suburbanism for the Professions

THE professional man of the city is probably destined to follow the printer and the manufacturer, the magazine and book maker and other artisans into the country. The departure of the *Cosmopolitan Magazine* into rural associations has been discounted by the removal of *Outing* as far as Deposit, N. Y. This

is not an *outré* affair, exceptional or insignificant, but a pointer of the age. Many lines of business can be transacted not only without loss of time and cash, at a distance from the city, but with decided advantage in the way of transit as well as profits. The saving in rent is, of course, the first factor, but nearness to fuel and frequently to power is to be considered. Beyond this the moral effect of peaceful and beautiful surroundings is not a matter of light import to either employers or employees. The continuous racket of city life pulls down the physical structure, disturbs and disorders the mental faculties, and has no slight bearing upon the *morale* of the human being.

The professional man is especially in need of rest and recuperation. Only the strong can endure the strain of city life for any length of time. The Chicago school authorities in a recent report affirm that there is a steady deterioration of vital force, which must be hereafter taken into account with more accuracy in dealing with the children of our larger cities. Among the injurious tendencies they count the jar, rattle and general noise of city life as most serious. The effect is equally disastrous upon adults. The problem is now confronting us whether we cannot escape, to a large extent, these destructive forces. The minister whose hearers cover a wide district is no nearer his flock by having a residence in the crowd than by inhabiting a suburban home. He must travel by trolley while hunting out these people in either case, and the difference in time is trifling—not seldom in his favor even, when starting from a less crowded district. He will not fail to meet any emergent call, for the telephone bell is in his country house, summoning him quite as readily as from his city home. Meanwhile his garden gives him exercise as well as considerable food, while his children grow up, like himself, without becoming victims of crowding and noise. He is no farther in time measure from the schoolhouse, as he is no farther from his church and flock. The libraries, the opera houses and stores are not inconveniently reached. Yet we are not sure that some of these will not also be suburbanized. An opera house in

a garden or park is not an impossibility; neither is a suburban store an impossible substitute for a downtown store. Half New York could go outward to purchase goods as easily as to go inward.

The lawyer seems to be more confined to city limitations—at least for his office. Yet it happens to be true that no other profession is so frequently securing suburban residences. The tendency to obtain summer homes was found to be suggestive of permanent homes. It demonstrated the possibilities; and now the country home is demanded not only for recreation but as an essential to the true evolution of a family. The lawyer, by means of the telephone, can transact a good deal of routine business even better than when confined to his office, with clients.

Doctors are developing a system of telephone service. One of them says: "A new scale of charges has arisen covering answers to consultation over the wire, frequently from a long distance. These are often answerable without a subsequent visit. It is curtailing the most laborious part of a physician's work, especially night drives." A recent report on rural telephones says: "Physicians are called over the wires, and while the trips made are fewer, the consultations are more frequent." From a professional standpoint this can only be satisfactory, for it gives the doctor a closer relation to all his clientele. He can observe a dozen patients at the same time. This applies quite as truly to the country as to the city. The development of rural telephones has been enormous during the last ten years. Near the villages there is hardly a farmer's house without its wire. Another ten years will make it hard to find a rural home still disconnected. It is a social revolution, and in no way is the change greater than in the relation of the family to its physician.

How far out may this suburbanism reach? This is beyond exact limitation. An electric car requires about fifteen minutes to cover three miles of good open track. This is increased within city limits as a rule, but that counts against the city and not against suburban residence. One half hour will

carry a lawyer or doctor five or six miles outside the crowded streets. This leaves each one to estimate his own interests. One lawyer writes: "I do not find it difficult to sustain my residence twelve miles outside of closely built city lines." The tendency is to create a change of hours. When we have adopted the country, or allowed it to adopt us, we soon begin to accept its suggestion. People naturally go to sleep at an earlier hour in the country and rise earlier in the morning. For this reason our days are longer, and if spent in the city we still have our evenings at home. A few carefully collected statistics show that the drift is quite decidedly toward the creation of country homes on the part of lawyers.

As we are discussing the problem of the professional man only, we cannot estimate the effect of city residence in general, or the extent of possible suburbanism. This estimate will follow the fact that the merchant is just as surely going to escape city restrictions as his neighbors. The banker is favorably situated for the change. The clerk and the apprentice may follow without any loss, but with favorable change of habits and immense gain in health and happiness. Suburbanism of this sort will certainly reach out from twenty-five to fifty miles around our larger cities, and around our smaller cities for eight or ten miles. Beyond this there will be an outer circle of manufacturing and printing houses, if not shops and stores. Will this suburbanism ultimately coalesce, leaving the city proper as a nucleus around our power houses, hotels and wholesale establishments? If so, is there room in the country for this sort of population? Can, for instance, New York State afford homes once more of two to five acres for all the congested city crowds?

The acreage of New York State is not far from twenty-three millions. The rural population is something over three millions, while that of New York City, with other large cities, including Buffalo, Albany, Syracuse, Rochester and Utica, is very near four and a half millions—or in all not very far from eight millions. This would give an even distribution of nearly three acres to every person in the State. But for families there would

be for each nearly fifteen acres—an ideal homestead. This does not allow for the untillable lands. These, however, grow less as science gains more control over culture. It is not probable that over one-twentieth of the State will long remain untouched by the plow. Few other States anywhere near approximate New York in ratio of population to acreage. Most of them would give to every family a farm of fifty acres or more. Suburbanism has before it almost a free field for a hundred years to come. We are confident that these hundred years ahead will see a radical change in the drift and distribution of the people—especially of the brain workers.

## The Prohibition of Divergent Teaching

A Catholic priest of distinction and unquestioned repute writes us about the proposed Catholic Encyclopedia. He is evidently in fear that it will fail to represent the Church in all its breadth; and this explains, our friend says, the cold indifference toward an enterprise which ought to be made of great value. Some believe it will do harm, and "at least one American Catholic scholar of international reputation has unconditionally refused to write a line for it." He adds:

In America Catholics are just beginning to fall into two classes which have been sharply defined in Europe for a long time. We are finding out that here, too, the movement of ideas is marking off the camps, thus far at peace, so far as our country is concerned, but inevitably destined for future war; the camp of conservatives, obscurantists and medievalists on the one side, and of progressives, liberals and moderns on the other. We have now among us a fast-growing multitude of good and loyal men who have been obliged by their study, thought and travel to hold opinions which the old fashioned school would condemn as rash, un-Catholic or even heretical. In such matters as biblical criticism, Church and State, temporal power and Italian autocracy, practically all independent Catholic scholars in the world have adopted views over which our classroom manuals have placed the danger sign, "*Non licet*." But there is no stopping the new spirit now. Its march onward and its ultimate triumph are as sure as the courses of the stars. Sentence of death may be pronounced a few times more against modern

ideas, but executed it can never be. Ideas are beyond the reach of all tribunals, civil or spiritual, secular or sacred.

Now what is the bearing of this upon the Catholic Encyclopedia? Simply this, that the part which Jesuit control has in it alarms the liberal men. Notwithstanding a long roll of Jesuit saints and mission heroes worthy of all honor, our learned correspondent says:

More the pity that to-day the once great Society is detested by the chief scholars of the Catholic Church as the principal instrument in intellectual persecution, as the organized hierophants of reaction. By the official rulings of this Order, and by an authoritative edict of Leo XIII, the Jesuits are bound, committed and almost vowed to intellectual mediocrity, obscurantism and intolerance. This is a harsh statement, but it is not made without proof which no amount of casuistical dialectic can destroy. The Jesuit Constitutions prohibit freedom of thinking even upon matters whereon perfect liberty is permitted in Catholic schools and universities.

If this is doubted we may read the law of iron which rests on every Jesuit to abandon his reason even on non-dogmatic questions and to accept blindly and totally the opinions officially recognized in the Society. We quote from their Constitutions:

"Let no divergent teaching be permitted, either in oral utterance, whether in pulpit or classroom, or in written books." P. iii, c. 1.

"Even in questions in which Catholic schools take opposing sides we must see to it that in the Society there shall reign uniformity." P. iii, c. 1.

The principle "*In dubiis libertas*," which is the foundation not only of intellectual freedom, but of intellectual life, is expressly excluded from all Jesuit schools, and no independent thinking is for one moment to be tolerated. Let us read from Leo XIII's "*Gravissime Nos*":

"Admirably did Ignatius Loyola observe that not at all satisfactory was the familiar rule often approved that opposing opinions may be tolerated, as in the saying, '*In dubiis libertas*,' but he saw it necessary that such divergent opinions should not at all be held in the Society, and he absolutely forbade them therein."

Consequently before a Jesuit pronounces the vows which bind him to his Order he is asked whether he is pre-

pared to abjure his intellect and think only as the Society is pleased to prescribe, as follows:

"Whether he is prepared to submit his own judgment—*ad iudicium suum submittendum*—and to think as it shall have been directed in the Society—*sentendumque ut fuerit constitutum in Societate*."

This pledge and promise, taken from "*Exam.*" c. iii, is cited and confirmed in his "*Gravissime Nos*" by Leo XIII.

One might think that such a suicidal rule was too drastic to be obeyed; and so it was for a while. But the famous Jesuit, General Aquaviva, in a letter of 1623 deplored the liberty of thought into which the Order had fallen, required it to hold fast to the teaching of Thomas Aquinas, and laid down regulations to stop all liberty of thought forevermore. It is an astounding witness to the efficacy of Aquaviva's ruling that the Jesuits have produced no great ecclesiastical scholar since his day. Maldonatus died in 1583, Tolet in 1596, Molina in 1601, Vasquez in 1604, Sanchez in 1610, Suarez in 1617, Bellarmine in 1621, Lessius in 1623, Leymann in 1625 and Petavius, greatest of all, in 1652. Never can such men return, so learned Catholics are wont to say, until the Catholic Church and the Society of Jesus abandon finally and forever Aquaviva's letter, Leo XIII's encyclical on the Thomistic philosophy, and the same Pope's brief "*Gravissime Nos*." This last document is a marvelous edict. It was addressed to the Jesuits in 1892, and binds them as students and teachers never to depart from or to oppose the integral philosophical system of Thomas Aquinas, who died in 1274. The rule is simple intellectual murder. The Pope destroys what little liberty of scientific thinking had been left by the Jesuit General Constitutions. He explicitly orders the persecution and degradation of men who cannot accept the entire Thomistic philosophy. He commands that his brief be read once a year in every Jesuit house of higher study; and he concludes with the ominous words:

"We decree and prescribe that the regulations given in this letter shall remain in force forever, and any attempt that may be made in the future to alter them we now declare to be null and void."

Now progressive Catholic scholars in

America object to having what they might write for the new Encyclopedia passed upon by men formed upon this system of training. One of the editors is a Jesuit; two of them are laymen, and one of them has lately translated from the Spanish a work against modern ideas much in the spirit of the "*Gravissime Nos*." Therefore it is that liberal Catholics look for nothing in the new Encyclopedia other than will be in harmony with the Jesuit Constitutions, Leo XIII's brief to the Jesuits, and the English translation of "What Is Liberalism?"

## Race Pride and Race Loyalty

No race has a great deal to be proud of. Possibly the Jews have as much as any other now existing, but its record has quite as much that is debased as of that which is glorious. Perhaps the Greeks, whom Galton judges to have been richer in geniuses than any other race that has ever existed, might have been as much justified as any in indulging in race pride, but Demosthenes was not sure of it when his Philippics were trying to arouse the patriotism of the citizens, calling on them as "Men of Athens;" and the "Apology of Socrates" presents to us a humiliating picture of a great multitude of a worthless populace and a very few good men charged with corrupting the youth and denying the gods.

In modern times race pride has much flourished in France, with its insane "glory;" in Germany, with its new education and Empire, and with the people who call themselves Anglo-Saxons. But perhaps the chief efflorescence of race pride has been in China, which has regarded all other people as "foreign devils." Even the Anglo-Saxon pride cannot equal the Chinese; and if it be a good thing, then the Chinese have afforded an example to all the world.

There was a time when the Hebrews were regarded as the Lord's "peculiar people." There are no "peculiar people" any longer. It was the mark of Christianity that it put responsibility of character on individuals and not on a race. Out of stones children could be raised up to Abraham. The dignity of

humanity is something we have learned in theory, far behind it as we may come in practice. Race makes no difference, if only a man's a man.

We now hear too often the advice given, even by so good a man as Dr. Booker Washington, to cultivate race pride and race loyalty. It is not wise advice. The advice to cultivate personal self-respect and loyalty to one's own best ideals and convictions is excellent; but no advice is good to try to cultivate pride in race or loyalty to race. Pride and loyalty should go to goodness, not to blood. Some races, to be sure, have achieved more than others; yet even so it is not the race but certain few wise men in the race who deserve the praise.

It is not particularly desirable to set up lines of division between races. Why more ghettos of nationality or color? We are ever trying to break down the dividing walls between nations. Out of any race may come efficiency or even genius. We are all now going to school in the art of war to a nation which our fathers thought hopelessly inferior. We are saying that it is to be hoped that the Japanese will not get the "big head," but what is race pride but "big head"? We do not see why Dr. Washington should claim to be glad that he was born a negro—or half a negro—or proud of either his white or negro blood; for we do not know that either of the races to which he belongs has, as a race, done anything to be proud of. Most of its members, on either side, have been of the character of the people whom Carlyle described as living south of the Tweed—"mostly fools," and we are not proud of fools, nor of commonplace people, much as we may love them.

**Russian Cowardice** We do not wonder that Rear-Admiral Nebogatoff does not accept his parole. He does not care to carry back to St. Petersburg the report of the Russian dead and wounded. He had no business to surrender, and if he should return to Russia he would stand a fair chance to be hanged for cowardice. The same is true of Rear-Admiral Enquist, who ran away with three strong cruisers during the first day's fight and fled to Manila, without waiting to see

the result of the battle. He was able to sail at good speed for seven days. If ever an officer deserved hanging Enquist does. And there is not much to be said for Rojestvensky, altho cowardice is not charged to him, but only incompetency. There are old naval rules under which he would be shot. He did no scouting, but dreamed that the Japanese were here and there and that they had but a weak force at the Tsushima channel, which he could easily break through. When he saw a Japanese scout he took it as evidence that there was only a small force in the neighborhood, and into the jaws of death he went stupidly. It is an admiral's business to know where his enemy is. That is what scouts are for. Equally incompetent was he to direct his fleet in battle. On the Russian side there was cowardice piled on stupidity. On the Japanese side there was the utmost skill and science. Hence the result.

**The Italian Gospels** The Pious Society of Saint Jerome for the Diffusion of the Holy Gospels in Italy has just celebrated its third anniversary, and the distribution in this time of 300,000 copies of the Gospels and Acts at from four to eight cents apiece is no small record of success. Be it understood that this is no Protestant work. It was started with the sanction of Leo XIII and has the special blessing of Pius X. It has thus far published only the Gospels and Acts, but they intend to issue also the other parts of the Bible. The translation is in excellent Italian, and the notes of Father Genocchi are brief and excellent. To accommodate our American law plates have been ordered in this country, so that it will be circulated among the multitudes of Italians in this country, a fact which we commend to certain Catholic journals which have very properly criticised the lack of interest which the Church in Italy has shown for the religious care of its emigrants to this country. There is no reason why Protestants should not use this version, just as the old Spanish version, made by Catholics, is in general use by Protestants. It is clear that a

great movement for reform is now under way in Rome, and the Pope, a thoroughly devout man, is at the head of the movement. We have received from Prof. Charles A. Briggs, who has been studying this movement in Rome, a copy of Father Genocchi's address at the third anniversary of this Society of Saint Jerome. While rejoicing in what it has done, he asks: "What are 300,000 copies of the Gospels in comparison with the millions and millions of copies of the Bible which the London Bible Society alone has scattered through all the world?" It is the intention, he says, of this society, to give the Bible to other lands than Italy, and particularly this is its purpose:

"To free Catholics, great and small, learned and ignorant, from a tremendous accusation, to which they cannot wholly give a convincing answer, an accusation persistently cast at our Church, that it defrauds the Catholic people of the bread of life, of the written word of God and particularly of the Gospels."

It is a matter of both great religious and literary interest that the issuing of the Gospels as if it were a new book has called for a circulation above that of any novel of the day.

A few centuries ago, in a naval battle, an Italian admiral was captured by the Turks. He was flayed and his skin was stuffed and is, we presume, still preserved among the trophies in Constantinople. By way of contrast, the other day Admiral Togo made a call of condolence on the wounded Rojestvensky, and the Minister of Marine sends him flowers. Really there is some improvement in the international courtesies of war.

The escape of three Russian cruisers to Manila will give our authorities no serious trouble. Doubtless they will be interned, as was another Russian war vessel at San Francisco, for it is incredible that Admiral Enquist, in danger of court-martial at home, will venture to sail out of port for Vladivostok, sure to be captured by the Japanese on watch. Now the Japanese can afford to be very lenient with the French who were overhospitable at Saigon.

## The Ætna Insurance Company of Hartford and Its New Building

WILLIAM B. CLARK,  
President of Ætna Insurance Company

THE Ætna Insurance Company, of which William B. Clark is President, and which has this day moved into its new building, was incorporated at the May session of the Legislature of Connecticut in 1819, with a capital of \$150,000. The beginning of this company, which was exceedingly modest, is set forth in "A Brief Historical Sketch," now issued in booklet form by the Ætna.

The first policy was for \$6,000. It was issued on August 17, 1819. This now constitutes a treasured possession of the company's office. Something like a month after writing their first policy the Ætna contracted to assume all of the outstanding risks of the Middletown Fire Insurance Company, which aggregated nearly \$200,000. This was the first case of reinsurance in Connecticut, and possibly the first in the entire country.

The Ætna was a pioneer in seeking

## From New York to Boston

PRESIDENT MELLEN's arguments before the Connecticut Legislature for the repeal of the present general railroad law of that State, now 34 years old, have been effective, for a repeal bill has been passed. Hereafter, a railroad company desiring to construct a line parallel to or competing with an existing road must first obtain a special charter from the Legislature. The New York Central has recently made surveys for such a line from a point on the Harlem road across the western part of the State to Springfield, Mass., where connection would be made with its leased (Boston & Albany) line to Boston. It was inferred from President Mellen's address to the Legislature that this survey was to be used as a menace to compel his company (the New York, New Haven & Hartford) to surrender its recently acquired control of the Ontario & Western, which extends the New Haven Company's lines through New York to Oswego. It will not be an easy matter to procure from the Connecticut Legislature a charter for a road to be built for such a purpose and providing for parallel competition with the New Haven Company's main line from New York to Boston.

THE United States Steel Corporation has bought the iron ore lands of the Canisteo Mining Company, on the Mesaba range. These lands contain more than 75,000,000 tons of ore, a deposit exceeding the quantity consumed or mined by the Corporation since it was organized.

....Immediately after Togo's great naval victory, Japan gave to American manufacturers an order for one hundred locomotives and nine hundred freight cars, at the same time confirming a previous order for one thousand freight cars which had been conditioned upon the result of that sea battle.

....Following the announcement of the reduction of the time of the New York Central's fastest train between New York and Chicago to 19 hours, the Pennsylvania company gives notice that it is about to run a new train between the same cities in 18 hours, making an

average speed for the entire distance of 49.8 miles an hour.

....It is reported that the Gould interests have made arrangements for extending their railway system from the Wabash terminal at Pittsburg through Pennsylvania and New Jersey to New York.

....Dividends announced:

International Paper Co., Preferred, 1½ per cent., payable July 1st.

Greene Consol. Copper Co., 4 per cent., payable June 20th.

*(Continued from page 1223.)*

other than local business. The company gradually established agencies at the more important centers of trade and thus continued until every desirable place in the country was occupied. The company very narrowly escaped financial destruction in 1827, but was saved by the conservatism of its directors. The *Ætna* was the first fire insurance company to issue a policy in Chicago. The earliest dividends paid were limited to one dollar per share. The dividend rates were subsequently greatly increased. In 1836 25 per cent. was so paid. In 1843 a dividend of 18 per cent. was declared. In 1848 \$20 per share was paid in dividends. In 1881 the company's capital was increased to \$4,000,000, at which figure it has since remained. The company having outgrown the building which it had occupied since 1867, it authorized by vote of the directors in December, 1902, the construction of a new fireproof building on the site of the old one. This new building, which is shown in the illustration printed on the preceding page, was formally opened to-day and the officers of the company kept "open house." A feature of the building is the *café* operated by the company for its employees. The building's appointments are sumptuous and the company incidentally maintains a modern and very complete printing establishment. The building is of granite and limestone. It has a frontage of 94½ feet and is 165 feet in depth. Its height is five stories. The construction is of brick and iron with tile roof and steel roller shutters on exposed sides. Metal fireproof furniture is used throughout the building and the fire hazard is kept down to the minimum.

No. 2950

## Survey of the World

### National Topics

Some time ago it was asserted by the Washington correspondents of several newspapers that Attorney-General Moody was unable to agree with Ex-Attorney-General Harmon and Mr. Judson, the attorneys employed by the Government to conduct the prosecution in the case of the rebates unlawfully paid by the Atchison railroad company, as to the action that should be taken. They desired, it was said, to prosecute the officers of the company as well as the corporation itself, having in mind Mr. Paul Morton, Secretary of the Navy, because he appeared, by the evidence as well as by his own admissions, to have been the officer directly responsible for the rebates in question. Mr. Moody held, it was asserted, that Secretary Morton ought not to be made a defendant. It is now reported that the two special attorneys have withdrawn from the case on account of this disagreement.—The attorneys employed for some months past in an investigation of the Beef Trust charges by a grand jury in Chicago have been in consultation with Mr. Moody as to the evidence thus far obtained. Conflicting reports as to his estimate of its strength are published. Some say the grand jury is inclined to return thirty indictments. Mr. Roberts, Director of the Mint, publishes an elaborate defense of Commissioner Garfield's report upon the beef companies, in reply to those who have sharply criticised it.—By formal petition the Receivers' and Shippers' Association of Cincinnati asks the President to proceed against all the leading railroad lines south of the Ohio and east of the Mississippi, alleging that by com-

bination agreements they are violating the Sherman Act, and that these agreements cause unjust discrimination in favor of the East and against the West and South. The movement is regarded as one of considerable importance.—Mr. Bonaparte, who is soon to become Secretary of the Navy, addressed the Republican State Committee of Maryland, last week, vigorously opposing the Constitutional Amendment which is designed to disfranchise a large majority of the negroes in the State, and which Senator Gorman seeks to make the issue of the coming fall campaign.—The new steamship regulations, suggested by the "Slocum" disaster, will go into effect on July 1st. Licenses or certificates will be withheld from owners who fail to comply with them. Some complain of the cost of the safety appliances that will be required. Regret is expressed by the officers in charge at Washington that Congress failed to enact the proposed legislation by which they would have been empowered to compel in every case the employment of a crew of sufficient size.

### Work for Reform in Philadelphia

Continuing his attack upon the Philadelphia ring, Mayor Weaver has removed the Assistant Director of the Department of Supplies and the Chief of the Bureau of Highways and has issued important orders to the police and other employees of the city. John A. Acker, storekeeper at the water works, has been arrested for taking bribes and certifying to fraudulent bills in favor of contractors. The policemen, firemen and all other employees of the

Departments of Public Safety and Public Works (about 10,000 in number) have been informed that the payment of political assessments is not hereafter to be compulsory; also that membership in certain political clubs will not be cause for appointment or promotion, but will be regarded as detrimental to proper discipline. Assessments have been collected by the agency of these clubs, which have also been used for the protection of vice. The policemen, firemen and other employees of the Department of Public Safety have been ordered to examine the voting lists and to report the number of voters registered as residing in their houses, and also the number of such persons actually entitled to vote from the same houses. It has been the custom to require these employees to have from 5 to 10 names registered from each of their dwellings. Provision was thus made for more than 50,000 fraudulent votes. Director Potter has begun to remove unworthy policemen. The first to go was a man recently appointed who had been arrested once for larceny, once for highway robbery, four times for breach of the peace, and three times for drunkenness, and had been in prison two years for assault and battery. The Mayor has asked the banks and trust companies that have \$18,000,000 of city funds on deposit to report what the average deposit has been and whether they pay a higher rate of interest to other depositors. He is still investigating the accounts of the United Gas Improvement Company with the city, and he finds that its statements as to the cost of gas works improvements (for which the city may be required to pay in 1907) have invariably been accepted without question, altho they include expenditures for repairs, which were excluded by the terms of the gas lease. A decline of \$40,000,000 in the market value of the capital stocks of companies controlling local public utilities having caused bankers to address complaints to him, he replied that his policy would be fair play for all corporations honestly conducted. He has appointed an advisory committee of fourteen prominent citizens. Among the members of it are John H. Converse, of the Baldwin Locomotive Works; William Potter, president of Jefferson Medical College;

Rudolph Blankenburg, a merchant who has written a history of rings in the city and the State; Charles Emory Smith, formerly Postmaster-General, now editor of the *Press*; W. W. Justice, wool merchant; and the presidents of two or three banks. President Cassatt, of the Pennsylvania Railroad, called upon the Mayor last week to discuss certain franchises in which his company is interested. Philadelphia newspapers say this was without precedent, it having been the practice of Mayors to call at the office of the President of this company. The history of an interesting job in connection with the planning and construction of the Torresdale boulevard has been unearthed. Land in the suburbs on the line of the projected boulevard was quietly acquired by the ring that made the plans. To punish one of the group who quarreled with his associates the plan was so changed that the boulevard, intended to be nearly straight, was turned aside at almost a right angle, in order that this man's land might be avoided.— There was an interesting scene in the Messiah Methodist church on the 4th, when William S. Vare, Recorder of Deeds, paid off a mortgage of nearly \$10,000 on the church property. The Vare brothers hold the street-cleaning contract and have been very influential in the "machine," controlling, it was commonly said, about one-third of the city vote and of the Councilmen. Recently they deserted Durham and came over to the Mayor, after he had given orders that the "machine's" specifications and advertisements for the letting of the street-cleaning contract for another term be canceled. In the church, before the mortgage was burned, Mr. Vare made an address and was affected to tears. An address was also made by the Rev. J. Wesley Sullivan, Chaplain of the State Senate, who resented with indignation the reported opinions of some persons that Mr. Vare's money was "tainted." "I don't believe," said he, "that the Vares have ever touched a dishonest dollar. They have lived too close to their church and their religion to do that. Mr. Rockefeller has also been unjustly accused. Like the Vares, he has lived too close to his religion to have obtained money in any sinister

way." It was mainly on account of the wish of the Vare brothers' mother, expressed before she died, that this money was paid for the relief of the church of which she had been a member.

#### **The Railroad Rate Question**

It is said by members of Congress who are now in Washington that the President is not now inclined to call a special session for railroad rate legislation. He had intended that the session should begin in October, but he yielded to the arguments of those who desired to be at their homes just before and at the time of the November elections. It has since appeared that little if anything could be gained by beginning the session a few days after those elections, with the opening of the regular session near at hand, as Congress would probably adjourn before the December opening to get the mileage allowance.—It is reported that the railway companies in their campaign against the proposed rate legislation will rely in part upon assistance to be given by large shippers at prominent terminal points who have had satisfactory rates and who think that under such legislation as the Esch-Townsend bill their own rates or the general rates affecting their business would be increased. At points in the upper Mississippi Valley the argument is used that rates would be made upon a mileage or distance basis if the Commission should be empowered to make them, and that in this way the prosperity of certain sections and industries would be blighted. On the other hand, it is pointed out that in the past the Commission has declined to be governed by considerations of distance, but has insisted upon giving weight also to commercial and physical conditions.—It is noticed that the official journal of the Brotherhood of Locomotive Engineers opposes any legislation that "would take the rate-making power from the railway management" and urges members of this prominent union to express disapproval of the proposed legislation in letters to their Senators and Representatives. It asserts that the enactment of such a measure as the Esch-Townsend bill would prevent any increase of railway employees' wages and

make it difficult for them to retain their present rates of pay.

#### **Coolie Labor for the Panama Canal**

In addition to his opinion that an eight-hour day for all laborers and mechanics employed on the Panama Canal is required by law, Attorney-General Moody has prepared another one relating to the proposed employment of coolies under contract. Pointing out that the condition of such laborers in other countries is one of involuntary servitude, limited in duration, and referring to the Thirteenth Amendment to the Constitution (which provides that involuntary servitude, except as a punishment for convicts, shall not exist in any place subject to the jurisdiction of the United States), he says that the utmost care must be taken to exclude on the Isthmus those conditions which have been indicated as those of involuntary servitude, or any other conditions of like effect or tendency. The Government must scrutinize not only the contracts made with persons supplying coolie labor, but also the contracts existing between these persons and the laborers themselves. He holds that our Alien Contract Labor law does not apply to the Canal Zone.—It is reported that the high freight rates on the Panama Railroad (heretofore maintained by the controlling influence of the trans-continental railways) may not be reduced, because of recent large expenditures for the road, but also partly for canal equipment. There is said to be some difference of opinion at Washington as to the action of the Commission in charging these expenditures to the railroad's construction and repair account. But it does not appear that the announced determination of the Government to reduce the rates has been reconsidered.

#### **Street Railways and Politics**

James Dalrymple, manager of Glasgow's street railways, ended his visit to Chicago on the 9th inst. In an address at a banquet given to him in that city he described conditions in Glasgow, narrating the history of the

municipalization of railways there, but contented himself with saying, with respect to Chicago, that his inquiries had convinced him that something should be done. At the same banquet Mayor Dunne said that Chicago could do as well as Glasgow had done. There must be no backward step, he continued, and Chicago's success in taking over and operating her street railways would mean an economic revolution in America. It would mean not only the municipalization of street railways, gas works, electric lighting and local telephone systems, but also Government ownership of the steam railroads, the telegraph lines, the long distance telephones and the express service, and the abolition of strikes and lockouts in connection with such utilities. At a political picnic in Cleveland Mr. Dalrymple spoke with more freedom than in Chicago. "We in Glasgow," said he, "know nothing of politics as it is known in American cities. As regards our municipal affairs we have no politics. If you conduct the street railway business on political lines you are doomed. You must not permit politics to interfere with it in the slightest degree." Street car transfers he regarded as "an abomination." They were not used in Glasgow. "If you continue to give them," he added, "you will not be able to reduce your fare below 5 cents." With transfers, the average ride here was more than twice as long as the average ride in Glasgow. In Cleveland and afterward in Chicago he repeated his warning that politics and "pull" must be absolutely divorced from the business; otherwise the experiment could not be successful.—Mayor Dunne gave notice on the 8th that under municipal ownership and operation all the employees on the railways, from motorman and conductor down, would be in the unclassified lists of the civil service. Critics at once pointed out that under such conditions they would be deprived of the safeguards and defenses of the merit system, and would be exposed to all the dangers of political interference. The Mayor's announcement has caused much surprise.

#### Labor Controversies

Several conferences between committees representing employers and strikers were held in Chicago last week, but they came to nothing. The strikers demanded that the express companies (who have taken no part in the negotiations) be boycotted, and that the protection of non-union drivers by police guards and sheriff's deputies be at once withdrawn. Both of these demands were rejected. There was comparatively little violence during the week. Cornelius P. Shea, president of the teamsters' union, was arrested upon an indictment for conspiracy, and also upon a charge of criminal libel because he asserted that Robert J. Thorne, manager of the store of Montgomery Ward & Co. (where the strike originated), had offered him \$10,000 two years ago to call a strike against a rival firm. There was much talk of bribery on both sides, employers saying that a corrupt offer for settlement had recently been made, and union men asserting that coal dealers had paid \$30,000 in strike benefits some years ago in return for action that caused the owners of large buildings to use coal instead of fuel gas. United States Judge Grosscup released two union leaders whom United States Judge Kohlsaat had committed for contempt because they refused to answer questions. The New York teamsters refused to go on strike in sympathy, but consented to an assessment amounting to about \$1,800 a day for the aid of the strikers. By Chicago newspapers the school teachers' union (Chicago Teachers' Federation) has been severely criticised for republishing in its *Bulletin*, with much editorial commendation, long articles from papers representing the strikers' interests. These articles were wholly in favor of the strikers and decidedly hostile to the employers, who were called "satanic plutocrats." Mayor Dunne, replying to the criticism of the Grand Jury, said that he had no right to call upon the militia until he had failed to maintain law and order by the police. This, he added, he had at no time failed to do.—In connection with a strike on the street railways of Saginaw and Bay City, Mich, there has been much disorder. In Saginaw a mechanic named Weick was killed and two other men

were wounded by a deputy sheriff who was guarding non-union employees on a car.—Charles Walz, a captain of militia at Springfield, Ill., has been warned by the local plumbers' union, of which he is a member, that unless he resigns from the service the firm that employs him will be placed on the list of open shops.—William Patten, a union iron molder in Cincinnati, on trial for killing a non-union molder named Weakley, last summer, during a strike, has pleaded guilty and been sent to the penitentiary for twenty years.—Walter Damrosch, leader of the Symphony Orchestra in New York, has been fined \$1,000 by the Musical Protective Union, of which he is a member, because he employed in the orchestra five French players, recent arrivals from Paris. They had taken out naturalization papers, applied for admission to the union, passed the union examination and paid their initiation fees. Admission was then refused, but after the payment of Mr. Damrosch's fine they were accepted as members. He had employed the men without obtaining his union's consent.

**Our Islands in  
the Pacific**

In Samar, Enrique Daguob, leader of the insurgents, and 42 of his followers have been killed by the troops under General Carter. At a meeting of the Federal party, in Manila, on the 9th, the radical element controlled the proceedings. After the rejection of the conservatives' proposition favoring an indefinite period of preparation for self-government, a platform calling for immediate independence was adopted.—The Hawaiian Legislature has adjourned, after refusing to make any appropriation for the support of the militia or of the Government band, which has been sustained by the public funds for 35 years. Probably the militia will disband. In a message to the Legislature the Governor remarked that in a majority of instances the salaries of white employees of the Government had been reduced by recent legislation, while those of Hawaiians had been increased. Whereupon the House by unanimous vote expressed regret that he had accused the Legislature of drawing a color line and denied that it had done this.—All the

Japanese laborers employed on the Hawaiian island of Maui have been on strike. About four weeks ago there was a revolt on one plantation, owing, it is said, to the refusal of the owners to discharge the overseer, a Russian. The strike spread until all the 2,300 laborers were involved. They attacked the planters' property and compelled the white people and the police to take refuge in the court house at Lahaina. Order was restored by troops sent from Honolulu.—Professor Seurat, an employee of the French Government, who has been studying the condition of the French islands in the Pacific for two years, will recommend that the French possessions in the South Seas be sold to some Power that has demonstrated its ability in the field of colonization. In Tahiti he finds great official corruption and general bankruptcy, the result of years of misrule. Social conditions, he says, are lamentable, moral conditions are unmentionable and commerce and agriculture are hopelessly depressed.

**The Fall of  
Delcasse**

M. Théophile Delcassé, who has been Minister of Foreign Affairs in five successive Cabinets since his first appointment in 1898, has at last found it necessary to resign because Premier Rouvier and his colleagues in the Ministry refuse to give him any further support. The immediate cause of his downfall is the failure of his African policy in two important countries, Morocco and Abyssinia, in both of which he has recently been checkmated by Emperor William of Germany. It was thought that he had scored a great triumph when Great Britain consented to permit the extension of French influence in Morocco, and it was expected that his policy of "pacific penetration" would in time make Morocco another Algeria. But the Sultan and his advisers showed great reluctance to allowing their country to be thus assimilated, and in this they were confirmed by the Kaiser, who made a timely visit to Tangier in his yacht and followed it up by sending a German mission, under the Count von Tattenbach-Ashold, to Fez, to counteract the French mission under M. Saint-René de Taillandier. As a consequence the

Sultan returned an emphatic declaration to the French Government that Morocco will not permit any reform, civil or military, to be carried out by any foreign Power unless such reforms are previously discussed by an international conference at Tangier. Germany then sent a note to all the Powers signatory to the Madrid Treaty of July 3d, 1880, calling attention to the fact that all nations are guaranteed equal rights in Morocco by that treaty and inviting them to a conference in accordance with the wish of Morocco. The French claim is that since the treaty deals solely with the protection of the lives and property of foreigners residing in Morocco "the most favored nation" clause refers also to the same subject and "does not warrant the German claim that the Powers agreed to exercise equal political control in Morocco." The Madrid Treaty was signed by General Lucius Fairchild for the United States. Austria has accepted the invitation of Germany to a conference on Moroccan affairs. This places France in a very difficult position, but Premier Rouvier evidently hopes that by sacrificing Delcassé and taking the portfolio of Foreign Affairs in his own hands he may conciliate Germany. The Kaiser has emphasized his triumph by at once conferring upon Chancellor von Bülow the titles of Prince and Baron when the news of Delcassé's fall was received at Berlin. He would probably have been made Prince years before, but he had not the fortune necessary to properly support the dignity of that rank. Now, however, this difficulty is removed by the bequest to him of \$1,375,000 by the late Herr Godefroy, of Hamburg. France, Germany, Russia, Italy, Great Britain and the United States have all within a year or two sent missions to Abyssinia to secure the chance to develop the resources of that country, but it appears that the prize will go to Germany, which has secured the right to build the first railroad into the interior. The French papers hold M. Delcassé responsible for this failure also. The more radical republicans of France have always disliked his alliance of the republic with despotic Russia and now that that alliance no longer serves its purpose of resisting Germany, it is more unpopular than ever.

#### Norway Secedes

Norway, which has been united to Sweden since 1814, has resumed its position among the nations as an entirely independent State by announcing the dissolution of the union and throwing off its allegiance to Oscar II. The immediate cause of the disruption is the refusal of Sweden to grant a separate consular system to Norway, altho the Norwegian people have for many years insisted that their commercial interests were not promoted by the Swedish Consuls under the control of the Swedish Foreign Minister. Since 1890 the agitation for a separate system has continued and reached a climax on May 28th, when a bill providing for Norwegian Consulates was passed by the Storthing and vetoed by the King. The Norwegian Ministers thereupon offered their resignations in a body, but King Oscar refused to receive them. The King having thus refused to follow the unanimous advice of the Norwegian Ministers, they considered that he had forfeited his position, and on June 7th the Storthing declared the union dissolved, and Oscar dethroned as King of Norway, by the passage of the following resolution:

*"Whereas*, All the members of the Council of State have laid down their offices, and

*"Whereas*, His Majesty the King has declared himself unable to establish a new Government for the country, and

*"Whereas*, The constitutional regal power thus becomes inoperative, the Storthing authorizes the members of the Council of State who retired to-day to exercise until further notice as the Norwegian Government the power appertaining to the King, in accordance with Norway's constitution and existing laws, with those changes which are necessitated by the fact that the union with Sweden under one King is dissolved in consequence of the King having ceased to act as a Norwegian King."

Christian Michelsen, who was Premier of the Cabinet, accepted in behalf of the Government the "valuable and difficult task with which the Storthing has intrusted to it." The following address to the King, asking for a Prince of the House of Bernadotte to serve as king, was passed:

"Your Majesty: The course of developments which have proved more powerful than the desire and will of individuals has led to this re-

sult. The union entered upon in 1814 has from the first hour been differently interpreted by the two nations both with regard to its spirit and letter. Efforts have been made on the Swedish side to extend the union and on the Norwegian side to confine it to the limit laid down by the act of union and otherwise to assert the independent power of both States in all matters not defined in that act as coming under the union.

"The difference of principle in the interpretation of the character of the union has provoked much misunderstanding between the two peoples and has caused much friction in the interpretation which during the recent negotiations between the two countries has been laid down by Sweden as against Norway. The Norwegian people were bound to perceive the injury to their constitutional right, their independence, and their national honor.

"The union was justified so long as it could contribute to the welfare and happiness of both peoples while maintaining their independence as a sovereign State. But above the union there stands for us Norwegians our Norwegian fatherland and for the Swedes their Swedish fatherland, while more valuable than the political union are the feelings of solidarity and voluntary cohesion of both peoples. The union has become a danger to this feeling of solidarity of the Norwegian and Swedish peoples which should secure the happiness of both nations and constitute their strength abroad.

"If the union is now severed the Norwegian people have no loftier wish than to live in good harmony with all and not least with the people of Sweden and the dynasty under the direction of which our country, despite many and bitter disputes affecting the union, has attained such important intellectual and material development.

"As evidence of the fact that the work and struggle of the Norwegian people for the full independence of the fatherland has not been founded on any ill feeling toward the royal house of the Swedish people, and has not left behind any bitterness toward either of these, the Storthing respectfully solicits your Majesty's co-operation to the end that a prince of your Majesty's house may be permitted, while relinquishing his right of succession to the throne of Sweden, to accept election as King of Norway."

There was no animosity manifested against the King, the proceedings of the Storthing were calm and dignified, and as the Prime Minister closed his address with the formula "God save our country," instead of the customary "God save the King and our country," the people were serious and even sad. There

has been no violence or disorder, and Premier Michelsen had refused to receive any popular delegations or to permit processions in his honor. On the morning of June 9th the union flag was hauled down from the tower of Akershus Fort, in Christiania, where it had floated since 1814, and the Norwegian tricolor was hoisted in its place with great ceremony in the presence of the members of the Storthing and 30,000 spectators, who joined in singing "Yes, We Love This Country," as the new flag was given the national salute and the troops presented arms. The Prayer Book of the Norwegian Church has been modified by omitting the prayers for the royal family and substituting a prayer for the welfare of the country. King Oscar at first refused to receive the delegation bringing the Address of the Storthing and manifested some anger and bitterness. Later, however, he received the delegation, but declared their action unconstitutional, since the union could only be dissolved by mutual consent. He is reported to have said: "So long as I live there will be no war between the two countries." All the officers of the Norwegian army and navy have taken the oath of allegiance with the new Government, and a system of military defense has been organized in case Sweden should decide to enforce her claims. The Swedish people have been enthusiastic in their demonstrations of affection and sympathy for King Oscar, but they manifest little excitement or anger against the Norwegians. Dr. Sven Hedin declares that an offensive and defensive alliance between the two countries is impossible, and that if the union be dissolved "Scandinavia may be changed into a European Korea." It is not probable that King Oscar will consent to place a member of his family upon the Norwegian throne, in which case a Prince of the Danish royal house may be selected, or Norway declared a republic. All the Norwegian Ministers and Consuls have resigned from the Swedish foreign service, and the Powers will soon be called upon to receive Norway's representatives. A petition to be signed by 100,000 Norwegian Americans is being prepared for presentation to President Roosevelt asking him to recognize Norway as a nation.

### Peace Negotiations

During the past week President Roosevelt has been actively engaged in bringing the belligerent Powers to consent to an exchange of peace terms, and it appears that his efforts have met with some success. After consultation with the representatives of Japan and Russia at Washington it was found that neither Government would object to his suggesting the desirability of bringing the war to a speedy conclusion, and on June 7th Ambassador Meyer obtained an audience with the Czar at Tsarskoe-Selo Palace and, calling his attention to Clause III of The Hague convention, which provides that an intermediary advance shall never be considered an unfriendly act by disputing Powers, the Czar consented to receive a communication from President Roosevelt on that subject. The President's letter, which is identical with that sent to Tokyo, is as follows:

"The President feels that the time has come when in the interest of all mankind he must endeavor to see if it is not possible to bring to an end the terrible and lamentable conflict now being waged. With both Russia and Japan the United States has inherited ties of friendship and good will. It hopes for the prosperity and welfare of each, and it feels that the progress of the world is set back by the war between those two great nations.

"The President accordingly urges the Russian and Japanese Governments, not only for their own sakes, but in the interest of the whole civilized world, to open direct negotiations for peace with each other. The President suggests that those peace negotiations be conducted directly and exclusively between the belligerents; in other words, that there may be a meeting of Russian and Japanese plenipotentiaries or delegates without any intermediary, in order to see if it is not possible for those representatives of the two Powers to agree to terms of peace. The President earnestly asks that the Russian Government do now agree to such a meeting and is asking the Japanese Government likewise to agree.

"While the President does not feel that any intermediary should be called in in respect to the peace negotiations themselves, he is entirely willing to do what he properly can, if the two Powers concerned feel that his services will be of aid in arranging the preliminaries as to the time and place of meeting. But if ever these preliminaries can be arranged directly between the two Powers, or in any other way,

the President will be glad, as his sole purpose is to bring about a meeting which the whole civilized world will pray may result in peace."

The result will probably be an armistice, and the meeting of representatives in Washington or Manchuria, or possibly some European capital, will exchange terms of peace. It is understood that Russia objects to granting full powers to her representatives to negotiate and conclude a permanent peace. Japan, on the other hand, would prefer that the peace commissioners should have plenipotentiary powers. No official statement has been given out of the demands of either party, but it is expected that Japan will ask for an indemnity of \$650,000,000, or more, to pay the expenses of the war; the withdrawal of Russian power from Manchuria, which will remain a Chinese province with Japanese influence predominating, as Russian influence has for the past few years; the cession of Port Arthur and a large part of the peninsula to Japan; the Chinese Eastern railroad through Manchuria to be placed in Japanese or neutral hands; fortifications of Vladivostok to be demolished and Russia pledged not to maintain a fleet in the Pacific waters for twenty-five years; all Russian warships interned in neutral ports to be handed over to Japan; the island of Sakhalin and perhaps Vladivostok to be held until permanent peace, or, at least, until the indemnity is paid. Of these terms it is understood that Russia will object most decidedly to the cession, even temporarily, of any Russian territory; and to restrictions upon her naval force in the Pacific. The Chinese Eastern railroad in Manchuria may possibly be sold for the benefit of Japan in lieu of the indemnity. The European papers of all nationalities unite in praise of President Roosevelt's action as a peace-maker. Even the Russian papers agree in commending it, with the exception of the *Novoe Vremya*, which calls it an advertising job, and accuses the President of being an enemy to Russia, as is shown by his refusal to allow the three cruisers in Manila to repair the damages of war.

# How Are the Working People to Free Themselves?

BY COUNT LEO TOLSTOY

[The following article is a letter to a peasant just written by Count Tolstoy and gives in some detail his advice to the workers of Russia in the terrible crisis the nation is now going through.—EDITOR.]

YOU ask me: "How long yet will the many millions of coarse, gray coats have to drag the overturned wagon?" You write: "The twentieth century has come already, and hard times have set in; the blood and the sweat of the unfortunate, enfeebled Russian people are pouring out. There will be no fathers, no brothers, no husbands, but there will be a multitude of cripples, and the overturned wagon stands on the same place."

You write me: "How long yet are we to drag thus and to sing the *dubinushka* (the workmen's song of the oaken cudgel): 'Eh, it goes, it goes, Oh, Oh!'"

You ask my advice: "How are the much-suffering and forbearing gray-coated peasants to drag the overturned wagon to the appointed place, and how are the people to free themselves from useless toil?"

I have written something about this very matter in my articles "The Only Remedy," "Must It Be So?" "Where Is the Way Out of It?" "To the Working People" and "Bethink Yourselves!" In these articles I have pointed out how, in my opinion, the working people can free themselves from their useless toil and sufferings. I will now attempt to answer your questions more clearly and briefly:

Everybody knows that it is both useless and hard to drag an overturned wagon. And, therefore, some people say: "The whole fault is that the wagon does not stand right; help us to stand it up right, the wheels down, and then everything will go smoothly."

I think that these people are wrong. Even if the wagon stood with its wheels down these very people who overturned it would be the first to get into the

wagon, and they would order you to drag them. They would not harness themselves; indeed, they turn the wagon over simply because they want to get into it. And when they all get into it the wagon must turn over again. It is just because so many get into the wagon that it turns upside down. In my opinion, it is not a question whether the wagon is upside down or not, but that you don't have to drag it at all. But you have allowed yourselves to be made use of, you have thrust your heads into the yoke, you have placed yourselves into the shafts, you have harnessed yourselves into the bad wagon, and then you complain that it is hard to drag it.

And if you have already harnessed yourselves, it is not a question now whether the wagon is upset or not, but how to unharness yourselves. And in order to unharness yourselves there is but one remedy.

There is but one remedy and a simple and easy remedy it is, but people have long forgotten it and have become disaccustomed from it. The remedy is—to *live in God*. And to live in God means to fear and obey God more than to fear and obey the village Police Chief, the Governor, the Czar. Thus if the Police Chief, the Governor, the Czar demand something from you, and God forbids it, to obey not the Police Chief, nor the Governor, nor the Czar, but God.

If you only begin to live thus, the wagon will remain where it is, alone, and you will live unharnessed, freely, and you will not complain of life as you now do, but you will be happy.

But to live in God you must live altogether in God, in all matters, and not merely to burn candles, to fast, to serve mass, to cross yourself before the images.

To live in God means to live according to the Commandments of the Gospel.

The First Commandment: "Ye have heard that it was said by them of old time, Thou shalt not kill; and whoever shall kill shall be in danger of the judgment: But I say unto you, That whosoever is angry with his brother without a cause shall be in danger of the judgment." Which means that it is forbidden not only to kill, but it is also forbidden to quarrel, to abuse each other, to bear ill-will to one another.

The Second: "Ye have heard that it was said by them of old time, Thou shalt not commit adultery: But I say unto you, That whosoever looketh on a woman to lust after her hath committed adultery with her already in his heart." Which means not only not to lead a depraved life, but also for husband and wife to live honestly and to guard against all that which provokes lust.

The Third: "Again, ye have heard it hath been said by them of old time, Thou shalt not forswear thyself, but shalt perform unto the Lord thine oaths: But I say unto you, Swear not at all." Which means not to take an oath at a court of justice, or of allegiance to the Czar, or to the army.

The Fourth: "Ye have heard that it hath been said, An eye for an eye, and a tooth for a tooth: But I say unto you, That ye resist not evil: But whosoever shall smite thee on thy right cheek, turn to him the other also." Which means not to pay injury for injury, not to bear vengeance, but to help others; not to punish, not to imprison, not to exile, not to put to death.

The Fifth: "Ye have heard that it hath been said, Thou shalt love thy neighbor, and hate thine enemy: But I say unto you, Love your enemies, bless them that curse you, do good to them that hate you." Which means not to consider other nations as enemies, and to make no difference between your own nation and another nation, and not to make war against it.

If people performed only these five Commandments of the Gospel as they now perform the Church rites the wagon would remain where it stands, and there would be no need of dragging it.

For, as I understand it, the wagon is

the masters—the rich, the functionaries, the land owners, the manufacturers, the priests, the bishops, all those that do not work themselves, but ride on the working people. The harness is the taxes, lack of land, the military service, the Church ceremonies, want, the factories, the high price of provisions, the low price of labor.

Taxes? Who will gather them if people will live in God? And if such people will be found, then the man that lives in God cannot pay taxes of his own free will, anyway. "If my money or my labor is necessary for a good cause," such a man will say, "I will bring it myself; but I cannot give up my money for prisons, for chains, for guns, for cannon, for salaries to generals. God does not tell me to do it, and I will not give it of my free will."

Lack of land? Who watches the land of the land owners and does not allow you to till it? And who plows it and tills it for the land owners? You are doing it yourselves. If a man lives in God he will not help an extortioner to rob his neighbor, and, however poor he may be, he would say: "I cannot go against the law of God and help you to rob. I will rather starve; but I cannot do it and will not do it."

Thus will also say such a man about swearing allegiance to the Czar, about military service. "Put me to death," such a man will say; "that's your affair. I will have to die some day anyway. Against the law of God I cannot and will not swear in to serve in the army, to serve the Czar."

Such a man will say the same with regard to war, when his services will be demanded for military purposes, or when he himself is taken into the army. He will say: "I have no enemies. I cannot go against God."

And thus in all matters. If a man lives in God he will not buy up for a trifle the cattle of his poor neighbor, or his house or his land; he will not lower the price fixed by his neighbors; he will not go to work for the rich, to help him wring out the souls of his poor comrades. And if people were to begin leading such a life there would be no rich people, no land owners, no functionaries, no priests, no bishops. And even if there should be

such people, they would earn their own livelihood and would not be a burden upon the rest of the people.

If people only remembered Christ's principal law, to do unto others as you would have others do unto you, all would be happy.

People complain that they live badly because of the rich and the authorities—that they ruin and kill them. But who tells them to live badly?

Even as vermin and all kinds of uncleanness beset a diseased body, so all sorts of rich people and authorities multiply in the bad life of the working people. Lead a good life and all this filth will disappear of itself.

That all functionaries, masters, commanders, land owners, priests, wine dealers, usurers live only by the sins of the people and would disappear if the people lived in God is to be seen from what has happened in various places where people began to live according to the Gospel (for instance, the people known as the Stundists).

The peasants lead a worldly life, they go to church, they obey the authorities and each lives for himself. Each one is looking for an opportunity to improve his own condition: he does not care for others and will snatch away the last coat from the poor. It is an evil life: people are fighting, drinking, going to court, debauching. Suddenly a divine spark falls into the midst of these people: one begins reading the Gospel; he begins to understand it; others begin to listen to him, and people begin to lead a godly life. At first there are but few people, then ever more and more. And immediately the entire life of these people changes. They begin to help one another, they cease drinking, smoking, debauching, cursing, fighting. And wherever such a life began the clergymen and the usurers and the dramshop keepers left the villages at once.

Thus it was also with the Dukhobors in the Caucasus. They began to lead a godly life, they put their property together, they worked together and shared not according to their earnings, but according to their needs, and there were no longer any poor in their midst, no drunkards, no debauchees, and all the dramshop keepers and the grafters moved

away from them. And the authorities also remained without work.

The Gurrians in the Caucasus have of late started to lead just such a life. The Gurrians have maintained themselves by agriculture. They used to rent land from the land owners. But the land owners began to charge them high prices for the land—instead of a tenth share, they now had to give them a third, and later a half. The life of the Gurrians became very hard and they all agreed not to rent the land of the land owners and not to work for them. They elected overseers of their own, they established order, stopped all robberies, thefts, drunkenness. They settled all their legal and public matters themselves, and they had nothing to do with the authorities. And their life would have been very good, but the Gurrians erred; they began to kill those that did not want to live according to their laws. And as soon as they did this the Russian troops were sent out to subdue them; and all their noble efforts were lost.

It is true that the Government did not and does not leave alone the Stundists, the Dukhobors or the Gurrians; it persecutes them, punishes them, tortures them. But it persecutes, punishes, tortures these people for leading a good life, not by some magic power, but by these same people, by yourselves.

Thus the salvation from all your troubles lies in no one but within yourselves.

"But," people will say, "it is good to do this when all act together, but when all are not together, and I alone or a small number of people will live like this, the Government will torture us to death."

It is true that the Government will not pat you on the head because you will please God and not the Government, and perhaps it will put you into prison; perhaps even torture you to death; but the Government can't act otherwise. The same was also with Christ, and then he bade his disciples to be prepared.

For it is not for the sake of leading a comfortable life that one is to live in God, but for the sake of the soul. Therefore he who believes in God, he who believes that our life is to consist of performing God's will, will not look around to see whether other people live thus,

but he will live as God bids him to live. He who believes in God and in his law knows that no wrong can come either to himself or to anybody else through his performing God's will.

Each man is given his choice, to live as he pleases—to follow Christ or the Police Chief. You can't serve God and Mammon.

If you wish to lead a worldly life, then don't talk of a righteous, common life; establish yourself in your worldly life, for yourself, as comfortably as you can. And if you did not get into the wagon, but into the yoke, don't complain.

And if you wish to live in God, then do not think of worldly matters.

You write me: "Teach me how to be wise in truth, how to live in satiety and be clothed." There is no such thing as this. It is one of the two: either to live for the truth or for satiety. And to live for satiety and make believe that you live for the truth, that is the worst thing of all—hypocrisy.

"Seek ye first His Kingdom and His righteousness and all these things shall

be added unto you." And the Kingdom of God is within you, and it is taken by force. If people will seek the Kingdom of Heaven and live in God their life will be a good life. And if bad people will seek happiness each one for himself, their life will be an evil life.

Thus it is not a question whether the wagon is upside down or not, but that you lead a good life. If your life be good, no one will harness you in any wagon. And if you lead an evil life you can't escape pulling the heavy wagon.

Therefore my advice is: Don't think about the wagon; let those that need it turn it over and pull it, and you, each and every one of you, use all your powers in the endeavor to lead the good life, to live according to the Gospel. And if people will live according to the Gospel their life will be a good life.

Answering you, I had in view many others who have asked me the same questions which you have asked and therefore, as I send you this letter, I am sending it also for publication.

YASNAYA POLYANA, RUSSIA.

## The Devil's White Fleet

BY CHARLES LEMUEL THOMPSON

WITH roaring, grinding and crashing,  
The Prince of the frosted air  
Slid from their glittering ways a fleet  
Of icebergs stately and fair.

He gave them the push of a mighty breath;  
"Sail South," said he, "and wait  
At the 'roaring forty' line for the ships  
That are loaded with human freight,

"And sink them there to the soundless sea,  
Hull—mast—and sail—and then  
Trail back to the line to shout with me  
Our victory over men."

The fair white fleet bore stately on,  
And without sound or sign,  
With batteries masked and pennants down,  
Ranged at the "forty line."

And then—since hull and icy spar  
Would show through the darkest night,  
They breathed one breath and a mist swept low  
And veiled them out of sight.

Silent and grim and deadly there,  
They wait on the vessels' track;  
Their allies—the crouching waves around—  
Curl menacing and black.

\* \* \* \* \*

Three sailor lads from the swinging bow  
And three from the crow's nest peer,  
While the captain stands the bridge—his hand  
On the call to the engineer.

"Slow down—dead slow—halt—and reverse!"  
Come the orders swift and clear;  
While the great ship drifts on a drifting tide,  
In a mystery of fear.

A volley from man's ally—the Sun—  
And from God's wind a breath—  
Shattered the mist! the fleet revealed  
In its battle line of death!

Signals the captain, "Full ahead!"  
The billows backward fly.  
The good ship takes the broad sea road,—  
"Fair kelpies of hell, goodbye!"

NEW YORK CITY.

# The Story of a Summer Hotel Waitress

[The following article is a frank exposure of real life below stairs in the average New England summer hotel. It shows what a refined and educated girl such as the writer must endure when she enters such service. We print the article just as it was submitted by the waitress, except for the omission of some details too disagreeable for publication.—EDITOR.]

IN illusive and bewildering array the usual prospectus issued by the proprietor of a popular summer hotel sets forth the benefits to be derived from a sojourn, however brief, in this one house over which he presides, and which alone insures to the guest "perfect service in all departments, immunity from dust, flies and mosquitoes," and, in short, from all possible annoyances and vexations.

How often have I wished with my whole heart that such a guest, for whose pleasure and convenience everything possible is done, could gaze upon the obverse of the picture, could see out of what strife and discomfort, yes, and sometimes from what squalor and even misery, the peace of his condition arises!

But that I may present my experiences in their logical order, that I may state clearly the facts and the manner of my learning them, let me explain a little how I came to be a waitress:

It was in the spring of 1902 that Miss X——, one of my classmates in the Normal School, came to me and asked me to go with her, as waitress, to a summer hotel at M——, with whose newly appointed manager, Mr. Brown, she had already signed a contract for the following season. The house, she informed me, was the largest at the resort, had the highest rates, and would, therefore, command the best class of patrons. "And then," she concluded, "the work isn't hard, and besides your regular pay of \$3 a week you often make as much, if not more, in tips, and you have such a good time!"

Here, ready made to my hand, was just the condition I had been wishing—a vacation by the sea, at no cost, and even some little profit. I promised to let her have my decision soon, and, after some persuasive efforts at home, I finally secured the reluctant consent of my people.

Miss X—— wrote to the manager in my behalf and he soon replied that he had placed my name on his list of employees.

The school year was nearing its close when Miss X—— coolly informed me one day that she had decided not to go to M——, but hoped I would not alter my decision on her account. "Certainly not," I replied, inwardly indignant at her desertion, but resolved to prove my ability to do quite as well alone.

So it resulted that in my confident ignorance I walked into the office of the R—— one July evening, suit case in hand, and demanded the manager, Mr. Brown. He came, after some little delay, a red-faced, blustering individual, to whom I stated my identity and my business there. No answer made he for a full minute, but stood there looking me over from head to toe, while my heart sank with foreboding, and I wondered to what unknown danger I was to be subjected. Then, without warning, he gave vent to such a torrent of upbraidings and curses, directed at the recreant Miss X——, whose name I had mentioned, that my knees grew weak beneath me. Now I perceived also that the man was intoxicated and my alarm increased. This, forsooth, was the beginning of the "good time" promised!

But the storm, so suddenly arisen, abated as the force of his passion spent itself, and he ended by calmly enough ordering a boy to show me to the cottage where the help had their rooms.

This I found to be a loosely constructed three-story building, painted hideously in red and yellow. A stairway separated it for the first two stories into two parts, the one occupied by the male, the other by the female employees. On the third floor, however, the partition was omitted, leaving one free to pass unhindered from one side to the other.

The housekeeper in charge assigned

me a room already occupied by three waitresses. But two beds, as I soon found, there necessitated four occupants; so there I was installed. The room itself was unceiled, uncarpeted, hot and filthy, and filled to overflowing by the possessions of my roommates. I am afraid that the spirit of love and sympathy that we are bade to cherish toward all grew silent in me that night as the three plied me with curious questions and I learned that of the three two were married, tho not living with their husbands, while the third, my prospective bedfellow, was a woman of perhaps thirty-five, whose face seemed to indicate that her love affairs had not prospered.

Thoroughly tired out, as it was now late in the evening, I faced the task of making ready for bed before these inquisitive eyes. But somehow, shrinkingly, painfully, I accomplished it and hid my hot cheeks among the coverlets, confidence quite vanished and only bitter homesickness in my heart. Sleep brought strength and courage, however, and next morning, as I donned my uniform of black dress, white apron, collar and cuffs, I resolved to live this new life bravely and to learn self-reliance from my experiences. Meanwhile my roommates were imparting to me much and varied information. "There ain't a dozen guests in the hotel," "You got to be over to the hotel by half-past six if you want anything to eat," "The head-waiter's Nora's brother," "You won't have nothin' to do till more folks come," and so they ran on. I was thankful for this last, as Miss X—— had represented me, without my knowledge at the time, as experienced, and now I must act the part as best I could.

Breakfast was a dismal failure for me. In a low, dingy underground room were several long tables, covered with oil-cloth, at which we seated ourselves. A glance revealed the tempting array—large chipped soup plates full of soggy oatmeal, bowls of boiled potatoes, meat whose odor was all-sufficient, and a cold, bitter mixture called, by courtesy only, coffee. My companions evidently failed to share my feelings, for they at once began eating heartily, joining in the laughing conversation of the others. Table etiquet was absolutely lacking.

"Grab for what you get" seemed the maxim there. I choked down a piece of dry bread—the butter was unpalatable—and tried to enjoy the experience. When Nora had finished she took me upstairs to the dining room and made me known to the head-waiter by the brief announcement, "Here's a new girl."

"Another new one? G——, we need a few more! More already than there is guests! Well, what's your name? 'There's nothin' to do this mornin', but when some people come you take charge of that table near the door, keep it set up and wash and clean the glass and silver on it. For side work clean and fill the syrup jars on the sideboards. Now you can go downstairs and find out where things are."

Later I learned that a wine boy served all liquors, that our actual working hours were rarely more than seven. In addition to the dining room duties all waitresses were required to do their own washing and care for their rooms.

Meanwhile, downstairs I found that the kitchen, pastry room, storeroom, serving room—indeed, the whole culinary department—were underground, which necessitated much going up and down stairs; not an easy or a beneficial thing to do when one carries a heavily loaded tray.

The kitchen was not a large one, was illy lighted and was almost without ventilation. The earthen floor covered with sawdust, the immense ranges blazing with heat, the cooks with perspiration streaming down their faces, their aprons not the spotless white I had imagined all cooks wore, but soiled by the meats and vegetables they handled—the whole formed an interior I never can forget, so disillusionary was it, so reeking with uncleanness, so far removed from the world of sunshine without.

Here were employed the chef, two meat cooks, one known as the "broiler," who cooked the steaks, chops, etc., the other as the "fryer," who attended the cooking of eggs and fish. Besides these were a couple of vegetable cooks, two pastry cooks, a man who made tea and coffee, and over all the steward, to whose orders all in the kitchen were subject. The thing which struck me at once was the extent to which the division of labor

was carried. Each one had his own definite place, from the steward to the boy who baked griddle cakes, and to step beyond this was, as I soon learned, unpardonable.

So I passed my first day in gaining acquaintance with my surroundings. But I could not eat the food; I feared the vulgar familiarity which the others seemed to court and the profanity which prevailed among men and women alike disgusted me. Most of all, the lack of privacy and of decent toilet arrangements distressed me. But I firmly resolved that for nothing would I give up and go home. I *would* grow accustomed to it somehow. So I struggled on, trying to be less sensitive and less expectant of anything resembling courtesy.

With the hot weather guests soon began to come, and I had something to do. I found very little difficulty with the work itself. A familiarity with correct table service was, of course, necessary, and a good memory, as we were not allowed to write our orders. The greatest trouble was in securing the meats from the cooks. The waitresses in all numbered about thirty, and it was no unusual occurrence for ten or twelve girls to give their orders to the cooks in quick succession, then rush away to make up the rest of the tray while these were being cooked. When it is remembered that each girl averaged at least four different meats, and that the cook must remember them all, it is seen to be no slight task. So it often followed that we would gather in a line waiting our turn to receive our orders, each as she came to the head of the line calling off her original order and giving place to the next as she received it. Very often, too, it chanced that the cook, confused and easily forgetful, would deny that a certain girl had ordered anything at all; then she must simply wait her turn over again, while the coffee and rolls and vegetables on her tray grew cold, her waiting guests became impatient and the head-waiter sent angry messages to "hustle up that girl down there or I'll see to her." This "the girl" received in silence, if she were wise, for it is only the brazen and coarse who will bandy insults with those whose position only insures to them this brief authority.

As the season advanced I was so fortunate as to become acquainted with several college girls and boys employed at various hotels near. Without them I doubt if I ever could have remained throughout the season. They, too, had met unpleasant conditions, in varying degrees, and the recital of all our miseries made, indeed, a woful tale. But these were forgotten temporarily in the delight of congenial companionship and the joy of our tramps into the surrounding country. I still cherish pleasant memories of evenings spent near a brawling stream, where we built bonfires and sat about them, singing college songs to a banjo's twanging accompaniment. Reluctantly always we returned to our world of work, but always, too, with renewed courage.

Another great help as well was the unfailing kindness and respect which I received from the guests whom I served. I would have resented any condescension, however slight, but I discovered no trace of it. Often they would draw me into conversation concerning books on the events of the day, but they never became unduly familiar. I am firmly convinced that it rests with the waitress herself whether she shall receive courtesy or insult. It did trouble me somewhat, I admit, when they made me gifts of money. The subject of tipping, with its doubtful ethics, is too broad a one to discuss fully here. But I must say this much, that the waitress cannot afford to work for the average wage now offered, and the solution of the problem must rest with the employer, who is, in truth, chiefly responsible for its existence.

While I had known vaguely that a bar was maintained in the house, this fact became most vividly and unpleasantly evident to me in August, when, influenced I doubt not by the increased heat and labor, cases of intoxication among the employees became rife. Often the head-waiter would not enter the dining room before eight in the morning, the steward sometimes was not sober for days together, while the chef and the cooks kept liquor constantly at hand as they worked. In consequence, quarreling and rough words were going on constantly and it required extreme care to avoid the drunken wrath of these men,

whose orders we must obey. One hot and busy noon, while my table was full of waiting guests, as I went to the kitchen for a salad to complete my tray I chanced to see the two meat cooks, who had been talking angrily, drop their work and rush upon each other, one with a knife in his hand. They struggled a moment, then fell to the floor, where they rolled in the sawdust, cursing volubly. I saw blood upon the face of one and fled, horrified. Somehow, tremblingly, I carried my tray upstairs into the dining room and served the food. To the remarks upon my colorless face and unsteady hands I only said that the tray was heavy. But the affair passed over with no one seriously injured and no one discharged.

Toward the end of August the manager lowered the rates in order to fill up the house, and several professional waiters from Boston were hired. These men were of the lowest, vilest class, their faces aged with dissipation and wholly repulsive. Many guests left in preference to being served by them. One of these men was given a table near mine and it was then that, for the first time, I knew the sensation of physical fear, tho I tried to ignore it. What made escape impossible was the fact that through carelessness or intentional vileness these waiters were given rooms on the side of the cottage assigned to women, where the corridors were always in darkness at night. The natural results followed, and, inspired by their example, many of the other men began to use the third floor as a means of entrance to our side of the building. The lowering of rates had brought to the hotel itself a class with similar morals and all respectable people left, so that my table was empty and I secured from the head-waiter my honorable discharge, which alone could secure to me my wages, as these are forfeited if an employee leaves for personal reasons.

The bitterness of my experience has lessened in retrospect and I can now see that the uneducated, beer-imbibing manager, intent solely upon money-getting, careless of the quality of either employees or guests, was solely responsible for the loss of prestige which the house sustained that summer and which, under

the same management, increased in following seasons, until it has now reached the lowest depths of ill fame.

A year later, at the end of my Normal School course, I found myself without funds, and, contrary to my resolutions, I consented again to go as waitress. This time it was with three of my classmates to an island hotel with a reputation for exclusiveness. Here the room assigned to my chum and myself was small, well plastered and scrupulously clean. When we had put up our posters, photographs and banners it was really cozy. Nearly every waitress we found was a college, university or Normal girl, while among the boys were represented Harvard, Yale, Dartmouth and Tufts colleges, the Institute of Technology and the University of Maine. Add to this satisfaction the fact that a hall, with piano, was constantly at our disposal, while the orchestra was given to us for one night of each week, and my astonished delight needs no explanation.

"Why were conditions so different here?" many may ask. First, I should answer, because the proprietor was a broad-minded man of refinement, who had made his lifelong home here; secondly, because he admitted as guests only people of the best class, of whose standing he had personal knowledge and who themselves would have resented the employment of professional servants.

I might multiply instances to show the cordial relations which existed between the guests and the employees of this house, but I will mention but one incident, which may well serve as an illustration: One member of the family I waited upon was an aged, white-haired lady, wife of ex-Governor ——. She was somewhat deaf and never spoke to me save concerning the service, about which she was extremely particular. About the middle of the season I met with a drowning accident, which, tho not serious, was so narrow an escape that I was nearly ill, while work became very burdensome and my spirits grew so depressed that I was most undeniably "blue" and homesick. One Sunday afternoon, as I sat alone in my room, with my head in my hands, meditating an immediate return home, a bell boy came to the door with a note for me. Imagine

my surprise upon opening it to find that it was from Mrs. B——! And the note itself! How much good it did me, with its sympathetic, affectionate words and admonitions to keep up my courage and bravery. And she closed by asking me to come to her room, that she might give me some medicine, which she hoped would make me well again. And it did, for after her motherly care of me how could I have been so ungrateful as to remain sick?

So the season slipped away, with its bathing, sailing and indoor amusements, until at last I reluctantly said good-by one day to my many new friends and to this happy island of the Atlantic. My wages here were the same as the previous season, and I made in all about fifty dollars.

Would that I might close my true story here, but that very truth compels me to go on to the last, most bitter experience of all.

Influenced by the strong recommendations of a hotel at a fashionable resort on the North Shore, I ventured forth with three friends the next summer (that of 1904) to this new field. This hotel was one of several owned by a Boston firm and was this season under the management of Mr. S——.

Here the help had their rooms in the hotel itself, as had not been the case the two preceding seasons. My friend and I were given a room in the attic, where all the waitresses roomed, which necessitated our climbing five long flights of stairs at least three times a day, and often six or seven times. No one without experience can realize how this wears upon one, especially since it is so often done when a waitress is thoroughly exhausted by the work she has been doing.

The room itself could not be reached without passing through two others, a course which often called forth very forcible objections from their inmates, but there was no other way. Our room, very small, illy lighted, practically without ventilation, contained almost no furnishings, save three beds. Indeed, when all our trunks were brought in there was room for nothing more, hardly for us.

The room gave entrance on one side to a small apartment made to serve as toilet room, and which also contained a

sink with faucet, where all the waitresses, about thirty, were required to obtain the water they used. Obviously there was no way of obtaining this save by passing through our room. Since we ourselves were obliged to thus trouble others we might have been somewhat charitable had it not been for the fact that at no time of day or night were we secure from intrusion.

When, after suffering from excessive heat and mosquitoes for hours, we at last fell into restless sleep, it was only to be awakened by the bang of our door as some one passed noisily through to the toilet room. At daybreak, when further sleep became impossible, we either rose, wearied in mind and body, or lay there and hated our situation. I well remember how each morning of my first week there, when from sleep's merciful oblivion I came back to day's horrible realities, I would sit up in bed and announce to my bedfellow, "Well, I can't stand this another day, and I'm going home." But some false pride kept me from giving up and I stayed on.

One hot morning it was discovered that we could obtain no water from the faucet. The housekeeper, who was the manager's wife, informed us that we must carry up our water from the kitchen, six floors below!

Of course, we made complaints, but no attention was given them or us. The climax was reached when one night we awoke, half suffocated, to find the room full of steam, which had somehow escaped from the pipes in the room. Hastily we sought the engineer, who only laughed at our alarm, until finally, when we had threatened to report him, with much cursing at us he did repair the break.

Meanwhile our two friends Florence and Eleanor, who were storeroom girls, had been assigned a room on the first floor; but such a room! It contained seven beds, set close together, barely allowing passageway between their foot and the wall. There was no ventilation save one small window at one end of the room and at the other a transom over the door, which opened into a short corridor, off which was another toilet room. This room was occupied by the lowest class of women in the hotel, scrub

women, dish washers and the like—old women, pitiful wrecks many of them were, loathsome and unclean of body and mind.

After enduring such conditions as long as we could we four took counsel together, and as a result went to the house-keeper. Now, Florence was a personal friend of Dr. M——, a silent partner of the firm who owned the house, and she acted as spokeswoman. She stated the conditions clearly to Mrs. S——, who, of course, was perfectly familiar with them, and she finished by saying that unless we could be given a decent room and toilet accommodations we were ready to go. Mrs. S——'s face plainly indicated that she would be only too glad of that, but restrained doubtless by thought of the possible consequences to herself and husband should Dr. M—— learn of the situation, she promised to consult Mr. S——.

As a result we four were given a room in the basement. Here, with but one flight of stairs to climb, the privilege of a bathroom and fairly good ventilation, we found a brief happiness. I cannot tell in a magazine, however, of the dirt and vermin of the place in which the girls were compelled to live nor of the temptations to which we were subjected. Still we might have better endured it all had we been given wholesome food. Throughout the whole season we had nothing which it really was safe to eat. Canned peas, containing some poisonous substance, coming from the tin, I suppose, were given us, and as a result the girls who ate any of them were seriously ill. For weeks at a time the *pièce de résistance* was beans—sour beans! But enough of such details—the memory is too unpleasant to recall.

The guests were all wealthy people, keeping their own carriages and liveried footmen, and many were educated, refined people. That they were entirely ignorant of the conditions I have mentioned I feel certain. Every care was exercised to prevent our even being seen by the guests when off duty; bathing was forbidden and certain walks were not allowed us. The hotel itself was most sumptuously furnished. I never have seen more perfect appointments and the rates ran as high as ten dollars a day.

The waitresses were nearly all professionals, and a certain four whom, among ourselves, we styled the "Big Four," were the most depraved, immoral waitresses I ever met. Oaths were constantly upon their lips and a night seldom passed that they were not completely intoxicated.

A personal experience will reveal what manner of man was Mr. K——, the head-waiter, a married man of about forty:

For the first week, as there were few guests in the house, I had little to do and Mr. K—— often asked me to serve him, which is considered a favor among waitresses. I served his dinner late one night in the then deserted officers' hall, and when he had finished he coolly turned off the electrics, ere I was aware what he was doing, and attempted a familiarity with me. I gave him to understand without delay that his position over me in the dining room did not extend to personal relations. He was somewhat angry and said, melodramatically: "You'll regret this before the season is over. We're friends no longer." "Oh, no," I answered, well aware that his enmity was undesirable, "you'll only respect me the more for this." But I did not know my man. All through that season I was almost idle, save when a rush forced him to give me people. One family were especially "good" in tipping me, and when he learned this he attempted to take them away from me and give them to his favorite, one of the "Big Four," whose close associate he was while off duty. The people themselves objected to this, so he did not do it, but he found enough other ways to make things disagreeable for me.

In August he gave me "stiffs," people who never tip, to wait upon, and my work was very heavy. I caught cold from the dampness in our sleeping room and this, combined with everything else, brought on so serious an illness that I could not go home. The memory of the days of my sickness and convalescence in that place are still too vivid and painful to be dwelt upon. I left as soon as possible, with all desire for table work, no matter how nor where nor when, forever at an end.

To discuss at length the wherefore of these indecent conditions is unnecessary

after what has gone before. It is just the world-old story of money-getting greed, with a brute indifference concerning the welfare of those whose service makes this possible. When the public shall force the hotelkeeper to publish not merely views of broad piazzas and

spacious parlors, but of helps' quarters as well; when it shall demand besides its own comforts and luxuries sanitary and decent provisions for all, then, and only then, will work in a summer hotel be sought and desired by the more respectable and educated class of servants.

## The Northampton Municipal Theater

BY PROF. ALFRED PEARCE DENNIS, PH.D.

OF SMITH COLLEGE

IT was remarked by Andrew Carnegie of Edward H. R. Lyman that he was the first philanthropist in the history of the world to give dramatic art a home of its own. These words were uttered by the most famous of American philanthropists on the occasion of the dedication of the new Carnegie House, recently presented to the Home Culture Clubs of Northampton, Mass.

But who is this Edward Lyman and

what is the character of the unique distinction ascribed to him? For generations the Lymans have lived in Northampton. They have always been people of means and of public spirit. In 1892 Mr. Lyman purchased the most central and convenient building site in Northampton, erected thereon a handsome theater and presented the grounds and edifice to the city of Northampton. It was a disinterested gift. There were no

The Northampton Academy of Music

adjoining private real estate holdings which he sought to boom. The theater was not to bear the name of its donor. Mr. Lyman had no desire to raise a monument to himself. He built and equipped a place of public entertainment at a cost not short of \$125,000 and presented it to his native city in recognition of the early attachments and associations of himself and his father, Honorable Joseph Lyman.

The deed of gift is an interesting document. It sets forth the earnest desire of the donor to contribute something to the happiness and well-being of his former fellow citizens. As the city is abundantly supplied with libraries and with school facilities, Mr. Lyman judged that he could best fulfil his purpose by supplying to the city a public playhouse to be administered for the purpose of providing entertainments of a wholesome, cultural character. The donor directs that the "Academy" shall be used solely and exclusively for the delivery of lectures, the production of concerts and operas and the representation and de-

lineation of the drama of the better character and such other kindred subjects as shall be approved by the unanimous vote of the board of management. But said premises, he stipulates, shall never be used for political meetings, or, rather, for the presentation of distinctively party politics.

As the Northampton Academy is with one possible exception the only American municipal theater in existence, a brief survey of its management, maintenance, entertainments and general place in the community may prove of some interest. The management of the theater is committed to a board of five trustees. The Mayor of the city and the President of Smith College are named in the deed of gift as *ex-officio* members. Chauncy H. Pierce and Timothy G. Spaulding, prominent citizens of Northampton, are, also named, together with the donor himself, as the remaining members of the board. In the matter of perpetuation two vacancies on the board as originally constituted are to be filled by the election of the board itself. A third place con-

trolled for one succession by heredity—the donor having provided for the succession of his son, Mr. Frank Lyman—is to be filled in case of vacancy by election of the board. The Mayor's position, a shifting fourth, is governed by the annual city election, and the remaining position, a constant fifth, is controlled by the trustees of Smith College. With the Mayor as one of the trustees the city is officially represented, but the board is essentially self-perpetuating in character, the management of the theater being thus withdrawn from the vortex of city politics. Mr. Lyman's distrust of political management is evidenced in his unwillingness to commit the administration of the playhouse directly to the City Council and also in his stipulation that the theater shall never be used for party rallies or political propagandism.

When the gift was made these provisions were severe-

Interior View of Theater, Northampton, Mass.

ly criticised by the hangers-on about the City Hall. They argued that the property of the city should be managed directly by the city government. It seemed un-American and undemocratic not to trust the City Council with the direct management of the city playhouse. The feeling was also freely expressed, even among some of the more public-spirited citizens, that the theater would eventually entail a heavy financial burden upon the city. Many difficulties seemed to stand in the way of the acceptance of the gift. The City Solicitor was of the opinion that the city could not legally tax its citizens for the purpose of maintaining a place of entertainment. The City Council, however, immediately accepted the gift. Later an appeal was made to the Great and General Court of Massachusetts for legislative sanction. At the State House hearing on the Enabling Act a party of local remonstrants protested vigorously against the acceptance of the gift. Some of these men were sincerely convinced that the theater was a veritable white elephant. This apprehension was not altogether groundless when viewed in the light of subsequent deficits in the annual balance sheet. Not a little of the opposition was factious and senseless. In every community there always exists a small class of select thinkers who view with alarm every innovation and stretch forth the Ishmaelitic hand against every reform. Mr. Lyman himself firmly believed that after a few years the theater would prove self-supporting. He expressly guaranteed the property against financial loss in operation for a period of three years. In that period an effort was made to build up a theater business in a city which was essentially a "poor theater town." Mr. Lyman paid out of his own pocket thousands of dollars to induce high-priced attractions to come to an unpromising "one-night stand." In those days such an actor as Joseph Jefferson could not be induced to make an engagement except on the basis of a \$1,500 guaranty. As the house receipts could not be expected to run over a thousand dollars on a Jefferson night, such an engagement entailed a cash contribution by Mr. Lyman of not less than five hundred dollars for the evening's entertainment. A demand for high-priced plays

EDWARD H. R. LYMAN,  
Donor Northampton Theater

has really been created. The gross receipts of the house in the past year are more than double the average receipts during the first three years of its existence. In the nine years subsequent to the expiration of Mr. Lyman's period of financial guaranty the theater has been operated at a net loss of about \$4,800. The amount is not large and yet the problem of the annual deficit is an important one. The Northampton taxpayer is justly sensitive to even a slight increase in the annual tax levy, inasmuch as a vast amount of taxable property in Northampton has passed within a generation under the dead hand of public institutions.

As was said of Admiral Coligny, nothing was wanting to his glory but material success. After more than a decade of trial nothing is wanting to the glory of the municipal theater experiment of Northampton but financial success. The question is often asked why a theater, constructed after the most approved plans, relieved of the burden of taxation and of interest and rental charges and harassed by no local competition, fails to pay expenses? There are several reasons for this. In the first place, the the-

ater was built for utility and comfort and not for the purpose of squeezing a maximum number of people into a minimum amount of space. In its superficialities the theater is strikingly commodious, yet its seating capacity is but 1,040. No provision was made in the plans for a second gallery, altho such a gallery would represent the difference in operating expenses between a surplus and a deficit. In the high class attractions no seats are sold for less than one dollar. A second gallery with four hundred seats at fifty or even twenty-five cents each would provide for the actual expense — about \$95 — of opening the house for a single performance. The theater is not run on the eleemosynary principle. The aim of the trustees is to give the best plays obtainable, but also to meet the demands and capabilities of different classes of people. Richard Mansfield or Miss Maude Adams can be depended upon to pack the house, no seat selling for less than \$1.50, the major part of the audience on such occasions being made up of Smith College students. On the other hand the Corse Payton Repertoire Company can be depended upon to fill the house with no tickets sold for more than thirty cents. The mill operatives demand cheap priced entertainments and the trustees provide them. A lurid melodrama, "The Limited Mail," will pack the house. A Paderewski concert will do no more. Medium priced attractions, lying between these two extremes, are uncertain quantities, their success depending largely upon whether they "take" with the young women of the College. College students are gre-

garious. Like certain species of fishes, they go in "schools" or not at all. Early in the past year Nance O'Neil's first appearance drew a \$331 house. A return engagement a month later, after she had been "discovered" by the College, ran up the receipts to \$929. Arnold Daly last May in "Candida" played to a \$333 house. Since then Bernard Shaw has become the vogue among the student illuminati and it is safe to assert that a

Shaw play would now fill every seat in the house.

Other reasons for the poor financial showing of the theater are to be found in the limited patronage afforded by a city of only eighteen thousand inhabitants; or, again, in the small charges exacted of local organizations, such as the City Minstrel performance or the Smith College Glee Club Concert, and, finally, in the refusal of the management to book questionable plays. For obvious reasons plays which have been rejected because of their objectionable character cannot

be enumerated here. It is sufficient to remark that the prerogatives of inquisition and veto are by no means dormant. The neighboring city of Holyoke has been attempting lately to deal with the indecent poster nuisance by municipal ordinance. The issue has never been raised in Northampton, simply because a play heralded by objectionable posters could not secure an engagement in Northampton. A curious bit of gossip went the rounds of the newspapers last autumn after Faversham's performance of "Letty" in the Northampton theater. The house was small, the college students being conspicuous by their absence. It was charged that President Seelye

L. CLARKE SEELYE,

President Smith College, Chairman Trustees,  
Northampton, Mass.

"killed" the play by publicly warning the students to keep away from it. No such admonition was ever given. If the play had been deemed objectionable it is safe to say that President Seelye as chairman of the Board of Trustees would have resorted to the "ounce of prevention" rather than to a very doubtful pound of cure. It may be said with confidence that the character of the Academy plays, so far from declining since the death of Mr. Edward Lyman, has in recent years improved.

The last decade has witnessed a decided tendency toward the enlargement of the field of municipal activity. City control of water supplies is now the rule rather than the exception. While municipal gas works are still infrequent in America, twenty per cent. of city electric lighting plants have passed under municipal control. No street railways are as yet operated by an American municipality, but Boston and New York have taken steps which will lead to the ultimate ownership of underground roads. The Illinois law of 1893 authorizes the cities in that State to own and operate street railways. The recent Chicago election reiterates in portentous tones the demand of that great city for immediate municipal ownership. The clamor against the so-called theater trust may serve to turn one's thoughts in ques-

tioning interest to the municipal control of playhouses. The Northampton theater furnishes the best American example of actual experience in the matter. Mr. Ben Greet in a lecture before a Brooklyn club is reported to have remarked that the Northampton Academy and the playhouse at Stratford-on-Avon were the only two model theaters of which he had any knowledge. One cannot but reflect upon the large place which the National Theater holds in the artistic activity of the Magyar capital, Budapest. This great playhouse, maintained by the Government, is a most important factor in the patriotic and intellectual life of the people. Of scarcely less importance in upholding the national speech and in encouraging poetic and literary activity is the Volks Theater of the same city, maintained by the municipal government. Certainly the Northampton Academy has proved, even beyond the high hopes of its donor, a means of recreation, education and culture to our citizens. No other Massachusetts city outside of Boston has in recent years been favored with such concerts and other high class entertainments. One can only begin to appreciate the unique value of the Northampton theater in the life of the community by asking a well-informed citizen what Northampton would be without it.

NORTHAMPTON, MASS.

## Musa In Eremo

BY EDITH M. THOMAS

My Crito (skilled in all expedient lore).  
Thou sayest, "Daughter of the slighted Muse,  
'Tis in thy power—a soother strain to use,  
And less exalt; that, when great Mammon's door  
At eve is open, and his slaves outpour,  
They, hearing thee, shall for a moment lose  
The goad of sharp-faced Care that still pursues:  
So both were blest—each from the other's store."

To this thy counsel, I make answer "No!  
I wish not any song of mine should lay  
The fret of self-entailed, gain-getting souls;  
But more and more brow-bent, still let them go;  
And let me through the desert sing my way—  
To die—or live, but not upon their doles!"

WEST NEW BRIGHTON, N. Y

# North and South: The Difference

BY MRS. L. H. HARRIS

[Mrs. Harris intends to visit New England this summer. We assure her that her sharp eyes will find other than "the Whittier type" and the "Franklin type." She will find that New England people quite enjoy being analyzed and dissected; for there is a certain titillation in being punched when one possesses an assurance of superior merit. Mrs. Harris writes us that this is "the most veracious study of human nature" she has ever written. Do her Northern and Southern readers agree?—EDITOR.]

RECENTLY a man from Boston, so young that he had not shed his university cuticle and so old with studying and thinking that he had a rheumy blue weariness in his eyes, came South "in search of ideas."

This was a generous thing to do under all the historical circumstances, and showed that he possessed the peculiar heroism of originality. Before this time when a New Englander visited this section he came either to impart his ideas or to confirm them. And while he has never succeeded very well, except at the point of the sword, in doing the former, he has always been able to do the latter. He makes a note of all our sins, places quotation marks about our heresies, returns home with the triumphant air of a rejected prophet and exclaims, "It is just as we supposed. The South has had forty years to recover herself, but the fences are still down; weeds and flies are everywhere; the negroes are neglected; the whites are belligerently ignorant and scandalously indifferent to their opportunities for doing good!" He amplifies and illustrates these impressions along the line of his previous convictions, but it is as exceptional for him to acquire an idea that was not already in his mind about the South as it is to find a Southern man who is governed by that very common system of ethics in New England which is the pedantry of righteousness. The explanation is that he is limited in comprehension by that kind of invincible provincialism which is founded upon merely mental training. He is a doctrinaire in his views of everything, including human nature. And in the South, at least, this is a masterly phenomenon which cannot be defined by a doctrine or even by a dictionary. But, because he cannot square it with the

bound volume of his theories as to what human nature should be, he condemns it as being very low in the scale of things.

His inconsistency is seen in the fact that when he lifts his voice above a confidential New England whisper he cries, "We are one people! One in sympathy, aims and achievements." He does not *feel* this to be so, but he *says* it in order to be consistent with his ideas rather than with himself. And he is so ignorant along his life lines that he does not know and cannot be made to believe that there is more veracity in feeling than in half the thinking and philosophic conclusions he may have reached.

Meanwhile the Southerner, who is as fathomless in his emotions as he is shallow in his mere thinking, smiles dryly and replies, "Yes, we are one people. But we have not the same temperament, nor the same motives for achievement. We do not love the same things, nor suffer the same temptations, nor serve the same devil, nor pray to the same God. We are one people—in law. And we are beginning to inherit therefore your iniquities in addition to our own, which is about all we ever shall inherit from such a set of philanthropic enemies. 'One people!' Negroes and all; confound you for the curse!"

But, returning to the young man from Boston and his extraordinary adventure, it is not too much to claim that there are "ideas" in the South. But they are indigenous to human nature. We do not borrow, nor transplant. They are not book marked nor annotated, but they are just free born notions of men and things that suit the people, the conditions and the climate. We do not make a moral fetish of them, but we change them from day to day to suit the exigencies of the situation. And it is much easier, less

disconcerting than to change the course of living to become a set of ideas which are not standard impressions, but whimsical, involuntary secretions of undisciplined minds.

The question is, Will the young man from Boston recognize this kind of an idea when he meets it in a fisticuff conversation with his Southern host, or will he call it a misbegotten prejudice. For in this section we think with violence when prodded by the cold steel of a New England intelligence. Always we prefer living to thinking, because we have a larger faculty for it. The Southern man never thinks as a means of enjoyment, because his capacity for pleasure is natural rather than intellectual, but with him it is a hard means to an end. He is therefore fiercely in earnest when the obligation is forced upon him. He invests all his passions and powers in the argument, which gives his idea a red-hot, indecent look to a poor, pacific young man from Boston, who hunts ideas as he would specimens with a butterfly net, for the fun of the thing.

And, by way of conceiving of the incredible, suppose he should acquire just one falcon clawed idea out of the South, what would be the effect upon his New England intelligence? It would "queer" him forever with his own kind. There would be a split in his logic, a limp in his ethics, a wink in his philosophy; and Boston would be like a book to him, the men in it mere leaves of a dry and musty tale. In short, he would be a man, and not a warehouse of ideas and theories. He would be more humanly kin to the poor and the wicked, and less cold-bloodedly intent upon "elevating" them. He would be reasonably inconsistent, and he would lose the diabolical faculty which many New Englanders have of making every other kind of person feel that he is a hopeless savage, an uncouth monster mentally and morally, fit only for "settlement home workers" to experiment upon. However, one might as well expect a dictionary to become a man as to expect a sure enough Boston bred, Harvard University trained man to become a *human* being. He is not even superhuman; he is simply the most pathetic example this world affords of the "ultimate type."

After all, it is easier to know what we want than to know what we need. Thus this adventurer from Boston went in search of more ideas because he wanted them and thought they were what he needed. He inherited this kind of mental acquisitiveness from a long line of people who placed an extravagant value upon intellectual attainments, and he bore a striking family resemblance to all the other men and women of his class in that region. This is accounted for by the fact that the people of New England are only anthropologically kin to their Pilgrim forefathers. Their real ancestors are the "blue laws" of the Connecticut Colony. They all have the same hardheaded Puritan skeleton inside their modern flesh and blood. And they still wear the Cotton Matther hall-mark of heaven upon their countenances, no matter how far afield they have wandered in the meantime from the dogmas he taught. The casual visitor in New England is impressed with the lack of diversity in the facial expression of the more intellectual classes. They vary from that of John Greenleaf Whittier to Benjamin Franklin's. And the variation is serious, not fanciful. It is a sort of birth mark in expression which does not result from personality but from history.

Now in the South we have never thought enough along any line to affect our bones. And we have accordingly a great diversity of features—some critics complain, "a veritable frivolity in chins"—certainly we have a naïve wittiness at being unlike one another. We often fail to resemble our own fathers; indeed, not because we fall morally short of kinship to them, but the Southern man's mind is not congenital. It is the undeveloped potentiality which his children inherit, while they are left astonishingly free to develop their own features and frowns.

But in the older North and East the passion for ideas and ideals has resulted in pattern types. Intellectual convictions rather than action have given a grim set to the New Englander's jawbone. He prays less than the Southerner, who is undoubtedly the beloved prodigal son of heaven, but he does much abstract moral thinking, which gives a sternly virtuous repose to his mouth. And this is pecul-

ially aggravating when we understand that he no more deserves praise for his righteousness than a stone does for its hardness. It is a terrible thing to be descended from a set of Sabbath day laws, and not from real natural fathers and mothers!

One day the writer was riding along a country road in Connecticut with a New Englander when we met a man who bore an astonishing resemblance to John Greenleaf Whittier.

"I thought your poet was dead!" I remarked by way of comment.

"He is. That is Mr. B., pastor of the church at C."

We had not gone far before we met another fac-simile of the poet. "Is this Mr. Whittier also a preacher?" I inquired, and was surprised to find that my companion did not see the resemblance. After that we met three of them returning from a nearby village, so much like one another and so much like the sainted bachelor poet that I remained discreetly silent. As a matter of fact they were composed of the same substance morally and spiritually which gave Whittier his beneficent and at the same time austere expression. They were the lineal descendants of the sentiment, poetry and ethics of New England. My host very greatly resembled Benjamin Franklin without his sunrise serenity of expression. And I saw one poor young man with a Jonathan Edwards cast of features who had prosecuted his search for ideas so far that he had become a Buddhist.

In the South we are not so given to thinking out our course. A man does not become anything from a course of thinking, but he is what he is from a course of action and inspiration. It is the one place where we have the advantage of our New England neighbor. We

are still in possession of our emotions and they frequently carry us further than anything he knows will justify. We are sublimely unscrupulous in our poetic flights of fancy in any direction because we are not cowed by intellectual considerations for the facts in the case. We will tell anything, so that it rimes with our emotions at the time. And we can believe in our own sincerity whether others can or not.

Now, as absurd as it may seem to the more rational mind, this results in a general average of physique and intelligence in the South which can be found nowhere else. In the North I have observed that the children of the poor indicate the fact by the coarseness of their features, but there are no more beautifully formed youths and maidens here than those denominated as "poor white trash." The difference between the aristocrat and the plebeian in this region is a matter of taste, not of beauty, of expression, nor of intelligence.

And finally, when a young man from this section travels abroad, no matter what class he comes from, he does not go "in search of ideas," but of experience. He is too busy living ever to furnish attic solutions for the problems of life. If any of them are solved in the South, he will never do it except with the sword. If that is impractical, he will go on living up to the hilt of his spirit while God and nature work out the problems. And, come to think of it, this is the final way. With all his thinking and searching after ideas the New Englander has more poverty and wickedness in his midst than we have. We are all sinners together down here, which is not so lonesome as being good by yourself in New England because you descended from a Puritanical creed.

NASHVILLE, TENN.

Road Near Orleans

## An Automobile Trip in France

BY CHARLES K. CRANE

[It is generally known that no country in the world has better roads than France, especially for the bicycle or automobile. The following brief article is taken from a letter of Mr. Crane describing an automobile tour he made last summer in France.—EDITOR.]

OUR party reached Paris the middle of August, and after looking around for a few days decided that the best way to spend our time would be to see the country in an automobile. So the first thing to do was to rent a twenty horse-power touring car. Then we started out with no particular idea excepting to go to Biarritz, and from there on, to plan as we went along. This proved to be a good way, for we could stop where we pleased, as well as save ourselves all the hurry and worry of traveling on schedule time. We spent the first night at Blois, having stopped for a couple of hours at Versailles on the way there. It didn't take us long to no-

tice the difference between French and American roads, and in these first one hundred and twenty miles to Blois we could see that it would be a long time before we have any roads in America so ideal for automobiling. Of the fifteen hundred miles we went, all but about fifty were macadamized, and for the most part level, or only slightly rolling.

The next morning we went through the Château at Blois, then to Tours for luncheon, and in the afternoon through the Château of Langeais, Rignay d'Ussé and Azay-le-Rideau, and passed the one at Amboise. Langeais is one of the few Châteaux that are furnished. It is occupied by a rich Parisian, who has spent

A Chateau in the South of France Near Toulouse

a good deal of money in keeping the old furniture in repair, and adding reproductions where it was necessary for the complete furnishing of the Chateau in the style of the fifteenth century, its original period. The exterior is very plain and has none of the architectural beauty of Chenonceaux, Amboise, and Chambord. That night we spent in Poitiers, having gone through Touraine and the country of the Loire in a day and a half, where two or three weeks would have been none too much.

The country from Poitiers to Biarritz

is pretty uninteresting, but the roads, with the exception of about fifty miles of "pavé" just south of Bordeaux, are perfect. One morning we went for over a hundred miles through a pine forest on an absolutely level road, and the machine easily held a forty mile an hour pace all of the way.

Biarritz is the only watering place in this part of France. It is very near the Spanish border, so that the life, different from most of France, is more like that of Spain. The women look Spanish, the men act it, and the crowd in gen-

Exterior of the Amphitheater at Nîmes.

eral, that we saw at a bull fight we went to in Bayonne nearby, was one of the most interesting things of the whole trip.

From Biarritz we followed along the Pyrenees, stopping at Pau for a night, and at Carcassonne to see a picturesque old walled city built in the fifth century. The next day we came to the Gulf of Lyons in the Mediterranean, and we followed along it for a while. It was just this variety of scenery that kept the trip

Maison-Carrée is an interesting old Roman temple built about the same time. We crossed the Rhone at Tarascon, and spent the night at Avignon, a walled city which at one time was the seat of the Papal court. From there we went in two days up along the Rhone to Valence, then to Grenoble and Aix-les-Bains, and from there to Geneva. At the Swiss border we had to deposit two hundred francs on the machine, and, considering

The Château Langeais—Entrance

from getting monotonous. For two days we were going through a country that was full of vineyards, and one can imagine the luxury of stopping by the road to pick a bunch of grapes, as you would an apple at home in the United States.

We soon left the Mediterranean and came to Nîmes. This city was the leading Roman colony in Gaul about two thousand years ago, and it is full of ruins of that period. The amphitheater, tho smaller and less famous than the one at Rome, is better preserved, and the

fact that the Swiss laws are very severe on automobiles, that it rained all the time we were there, and that the roads are very hilly, we were not altogether sorry to leave Switzerland, after we had spent three days in visiting Lausanne, Interlaken, and Lucerne.

The run from Lucerne back to Paris, through Basel and the country of the Seine was rather uninteresting with the exception of Belfort, where there is a huge lion carved from stone, the work of Bartholdi.

# The New Naval Secretary

BY DAY ALLEN WILLEY

"The people of Baltimore fervently wish and imperatively demand a system of sewerage worthy of the city and of modern times; but they also wish no less fervently and demand no less imperatively that this great public improvement be effected without overburdening the taxpayers, impairing the city's credit or furnishing a grab-bag for adepts in graft, and to these ends they ask that the work be done on business principles, and the workmen who do it, so far as chosen by public officers, be chosen for merit and fitness, not from partisan or personal favoritism."

THESE may be called the master words which have actuated the policy of Charles J. Bonaparte since he became known as a figure in public life. Uttered in the last speech delivered before the public announcement that he had been chosen as a Cabinet adviser of the President, the idea they convey has been heard before societies and conventions devoted to re-

form in the civil service, until Mr. Bonaparte has come to be regarded as the leading exponent of this movement in America. It is worth while to quote the above sentences, as it was this line of thought which first directed the attention of Mr. Roosevelt to the Baltimore reformer and has made the latter undoubtedly the most unpopular man to-day with the politicians of Maryland, irrespective of party, a fact which he probably considers a high personal compliment.

To give an idea of the inner life and characteristics of the man who is to take the portfolio of the Navy, and who some have predicted will eventually become the Secretary of State, it is necessary to refer briefly to his connection with municipal and State affairs in Maryland, since here naturally has been his principal sphere of activity, where he not only talked, but worked and secured results. It may be said that the mantle of Severn Teackle Wallis, the noted Maryland lawyer and statesman, was bequeathed to him, for during the last thirty years he has taken the part of the ordinary people against political moves which he thought detrimental to their interests. Gathering around him an organization of professional and business men who realized the purity of his motives, year in and year out he has fought against the machine which might be in power, whether Democrat or Republican, each receiving its share of his attention.

In the days of the old Civil Service Reform League he was prominent. When the power of Gorman was overthrown in 1895, and the Democratic Party again defeated in the State in 1897, Mr. Bonaparte realized the opportunity to make the most of the situa-

CHARLES JEROME BONAPARTE.

tion, and it is generally admitted that the opposition which exists in Baltimore and the State to-day to ring politics has been created almost entirely by his energy and effort. There are machines and machines. New York has its Tammany, but it is a Tammany that has done things, such as providing municipal improvements and maintaining them. For example, Tammany paved the streets and kept them fairly clean. It provided a police force which averaged up to a better standard than in other large cities. In short, it is a working organization and the taxpayers get some returns for their money. The Baltimore machine has been active only during the campaigns, indifferent as to whether its appointees made even a pretense of doing their duty. Consequently the citizens have perhaps had less returns out of the public money than elsewhere in the country. For so many years did they suffer from the evil of graft that those who would seek to eliminate it had to overcome a feeling of public despondency which has perhaps been unequalled elsewhere—even in Philadelphia. Thus it was that for over twenty years Mr. Bonaparte and his followers fought the system before popular sentiment made a demonstration in their favor at the polls. But the contest revealed the persistency and determination of the man, and in the last ten years the influence he has been so instrumental in creating has steadily increased, until it is stronger to-day than ever before in the history of the city.

His friends and those who have been associated with him have absolute confidence in his honesty of purpose. This is why the forlorn hope of better things for Baltimore—the Reform League—has clung to him through thick and thin, allowing him practically to dictate its policy, and it must be said to execute a very large share of it. He has shown

MRS. CHARLES JEROME BONAPARTE.

that he is absolutely indifferent to compliment or criticism. He is an aristocrat, not only in lineage, but in principle. If he believes a thing is right, he will uphold it and work for it if deserted by every associate. In the early days of the "Thirty Years' War" in Maryland gossip has it that more than once the leaders of the opposition approached the grandson of King Jerome with offers of position and influence which might have successfully tempted many a man of different caliber, but soon all overtures ceased, for it was recognized that he was absolutely beyond approach. While this is due chiefly to his ideas of citizenship, his social and financial position is such that office is a minor consideration. Failing to win him over, some of the ring leaders took up the weapons of ridicule, but here they made their mistake, for they were op-

posed to a man who can use the weapon of sarcasm like a two-edged sword, turning the words of an antagonist upon himself. Such is his reputation that after he began taking an active part in public life the mere fact that he was to address a meeting would draw a throng of people to hear his display of wit, and when a campaign in Baltimore is on it is a common saying: "Let's go down to-night and hear Bonaparte give it to 'em."

It is a curious paradox that, tho he has ever been entirely outside of the councils of the Republican organization, the strong position of the party in Maryland to-day is due more to him than to any other man. As one of his critics has well said:

"Mr. Bonaparte has had much more to do than any one else with making it possible for the Republican Party to be a real power in this State. Here was a man that could always be thought of as being of statesmanlike caliber, a man whose Republicanism was a matter of ideas and not of offices, a man who stood fully in the class with the best that the Democratic Party could show, and a man whose reputation was as great outside of Maryland as within her borders. The everyday business of party management has to be looked after, to be sure; but, above all, it is necessary for the party to have a status in the minds of thinking people. Mr. Bonaparte's contribution to this end has been simply invaluable to the Republican Party of Maryland."

It is easy to understand why such men as Roosevelt and Bonaparte enjoy a friendship far more intimate than is generally known. They are the same in so many ideas, altho in their habits they are almost entirely unlike. Excepting that both are lovers of nature and both are strictly temperate, the man in the White House is almost the reverse physically of the one who became one of his principal advisers long before his selection for the Cabinet was announced. To a certain extent Mr. Bonaparte is a believer in the simple life, in the fact that he is very quiet in his tastes. Possessed of ample means to lead a somewhat exclusive life, most of his leisure time is passed at his country seat, a few miles outside of Baltimore, altho he has a town house, which is open in the winter and where from time to time he entertains a coterie of intimate friends, which includes Cardinal Gibbons and men and women

prominent in the cultured society of the city.

At his country home Mr. Bonaparte has surrounded himself with every modern convenience for up-to-date farming. He has a capable manager for his place and he keeps a large force of hands. Everything indicates perfect system and order. His residence is supplied with gas and running water, and his cattle, his horses, his fine flock of Southdown sheep, his hogs, his poultry, and even his dogs, are all provided with shelter of uniform architecture. In the stable for the pleasure and light draft horses, near the mansion, there are rooms for the grooms and men employed about the house and grounds. There is also a dairy with all of the latest appliances.

Next to the hours spent in the country perhaps his principal enjoyment is driving to and from his country place, which takes him through some of the most attractive scenery of Maryland. His office hours are somewhat longer than those of the ordinary professional man, and six o'clock in the evening frequently finds him at his desk, especially if he has some work to do outside of his legal practice. It may be said that he never hesitates to perform any labor connected with the reform movement, no matter how trivial, if he deems it necessary, and that few Americans devote more time to the public interest in making speeches, attending conventions and presiding over gatherings, owing to his various connections with societies formed in the interest of his principles.

Few American citizens can boast of having an emperor for a great-uncle, and a king for a grandfather. The new Naval Secretary can justly make this claim, but he never does, preferring to be considered a plain American rather than a descendant of the nobility of the Old World. In his case the personal characteristics of Napoleon I are apparent, but his energy and independence were also traits of his great-grandmother. The marriage of his grandfather to Elizabeth Patterson was one of the first international alliances of note, the wife of King Jerome being considered one of the most beautiful women of her time. Possibly the reputation which Baltimore has for its handsome women was partly

due to her personal charm, but she united beauty to wealth and social position, the Patterson family being one of the most prominent in the early days of the city. Mr. Bonaparte's father never became an American citizen. His elder son served for a time in the United States army, but later was given a commission in the French army, and during the latter part of his life enjoyed the title of Prince Napoleon, altho it was spent in the United States. Charles Joseph has resided in Baltimore all of his life, but married a native of New England, Miss Ellen Channing Day, of Boston. The marriage was celebrated at Newport in 1875. They have no children.

Personally the new Cabinet officer is one of the most interesting figures in Baltimore. Altho past the fiftieth milestone of his age, his regular habits and strong constitution give him the appearance of a man of forty, or even less. He not only looks the gentleman, but dresses as one, every feature of his attire indicating neatness and refined taste. He wears a "turndown" collar, to the invariable accompaniment of a black bow tie. His face is always freshly shaven, and his skin presents a healthy glow, set off by his coal-black mustache and hair. His French ancestry is in part indicated by the vivacity of his gestures. He talks about everyday subjects exactly as he writes an interview, and he is, therefore, an exceedingly interesting character. Every word he utters and every idea he advances indicates his originality of thought. In conversation and mannerisms he is unlike any one else, and his style is of the individual kind that no one can imitate.

During the time he is in the Cabinet Mr. Bonaparte will make the American people a present of at least \$20,000 yearly

in time. The \$8,000 a year he will receive for his services is a small percentage of the income which accrues from the practice of his profession. He is one of the largest real estate owners not only in the city but in the State; consequently his enemies have no argument that he is not a taxpayer, since his payments into the city and State treasuries for such purposes range into the tens of thousands yearly. Referring to taxes brings to mind an incident which came under the observation of the writer a year or so ago. With a delegation of the Baltimore Reform League Mr. Bonaparte appeared before the State Legislature to advocate the repeal of a certain measure. At the end of his argument the chairman of the legislative committee stated that it had another measure under consideration advocating an increase in the salaries of the public school teachers of the city. He asked Mr. Bonaparte if as a taxpayer he would care to make any statement for or against the measure.

This was the reply: "Mr. Chairman, so far as I am personally concerned I have not the slightest objection to the measure, and may add that it has my entire approval."

The significance of this statement will be appreciated when it is remembered that the subject of this sketch ranks as among the most prominent laymen in the Roman Catholic Church in the United States, and is not only an intimate friend but possibly the chief adviser of Cardinal Gibbons. Nearly all of the children of Roman Catholic parents in Maryland are educated at the parochial schools, and Mr. Bonaparte's only interest in the public school system is that of the ordinary citizen.

# The Marquis of Dufferin and Ava\*

BY GOLDWIN SMITH, D.C.L.

THE Marquis of Dufferin and Ava was, if not one of the most important, one of the most brilliant, of the public men of his day. He combined considerable ability, practical and diplomatic, with an endowment of what Chesterfield called "the graces," which made him the favorite of the court and of the drawing room. He had also literary gifts of no mean order. Good looks completed his natural equipment. There was Sheridan blood, by the mother's side, in his veins, and it brought with it a measure of wit, which crowned his accomplishments, tho it might not equal that of his great-grandfather, who, when he was reeling home full of liquor and the watchman asked him his name, answered, "Mr. Wilberforce."

Dufferin was at Eton, where at that time he could learn nothing but a little Greek and Latin. In fact, Eton at that time was hardly a place of education, tho it was one of a social training, supposed to be specially that of gentlemen, and high in its way, tho narrow. In those days, the days before reform, many of the boys went, not to the university or into professions, but into crack regiments; others into the diplomatic service or the household of the Court. Still, Eton was, in an unscholastic way, intellectually active. Many of the boys came from political families and there was always a lively interest in public questions and events. Nor were literary tastes altogether wanting.

From Eton, Dufferin went to Oxford, where he lived, it seems, with an intellectual circle, and studied, tho he graduated without honors. He through life kept up his familiarity with the classics, and as Governor-General of Canada replied to an academic address in Greek, tho it was not exactly the Greek of Demosthenes.

Dufferin inherited with his Irish peer-

age a large Irish estate. But an Irish estate in the days of the Land League and its three "F's" (Fair Rent, Fixity of Tenure and Free Sale) was a rather purgatorial possession. In a speech to his tenantry Dufferin described the Irish landlord as "an individual who does not get rent and a well-dressed gentleman who may be shot with impunity." As a landlord he was himself a great improver, and spent, as he tells us, a very large sum in that way. The task, as inspection of its scene showed him, was not inviting.

"This inspection has been both careful and interesting; but at the same time it was rather a sad employment—to walk day after day in a dull, thick rain, over a bleak country, treeless and hedgeless, scarred all over with crooked stone walls, which inclose three-cornered bits of half-cultivated fields; to wade up unmade clay lanes to the doors of cottages, perched away on slanting pieces of rock, green outside with damp and black inside with smoke; to be almost upset by the conscious pig, as he rushes out between your legs—lest you should see how comfortably domesticated he is with the family inside; to listen to the oft-repeated tale of loss of cattle by murrain and children by fever, which, gorged and satiated, seems only to have retreated for a time to the reeking heap of filth beneath the windows, whence, as from a citadel, he may sally forth to snatch fresh victims day after day; I repeat, to witness such sights as these which, tho by no means universal, are yet too frequent, is, I assure you, by no means calculated to raise the spirits. The evils are so gigantic and so independent of the landlord's control that after a long day's walk I often came home confounded, but never despairing. I reflected that time, management, education, nothing could resist: that improvement once in progress acquires itself an innate power of motion, and if not in this, at all events in the next generation, the whole tone of people's habits might be raised."

The peerage of Ireland under the Act of Union elects twenty-eight representatives of its number to the House of Lords. The majority of the Order being Tory, Liberals were practically excluded, and Dufferin was a Liberal. But the

\* THE LIFE OF THE MARQUIS OF DUFFERIN AND AVA. By Sir Alfred Lyall, P.C. With Portraits and Illustrations. In two volumes. London: John Murray; New York: Charles Scribner's Sons. \$7.50.

Liberal Government cut the knot by creating him an English peer. He was at the same time made a Lord-in-Waiting. In the House of Lords he never made a great mark. Diplomacy, the Council Board, the Court and the drawing room were his sphere. To the heart of the Court the new Lord-in-Waiting soon made his way.

Lord Dufferin's first important mis-

the punishment of Turkish officials who had connived at the massacre, and was received at home with a full meed of applause.

On his return Dufferin became Under-Secretary of State, first for India, then for War. Afterward he was put into the almost nominal office of Chancellor of the Duchy of Lancaster. For some time he was occupied with home politics and

The Marquis of Dufferin and Ava, 1901. From the picture by Henrietta Rae. From Lyall's "The Life of the Marquis of Dufferin." Scribner's

sion was to Syria, where, under the Upas tree shade of Turkish Empire, infamously sustained by the selfish interest of European Powers, corruption, disorder and violence reigned. There had been a frightful massacre of the Maronites, an ancient Christian sect, by their Mohammedan enemies, the Druses. Dufferin performed the object of this mission with prudence and firmness, insisting on

with the legislation about Irish land, which threatened his position with that of the Irish gentry in general and from which he evidently dissented, tho he was always a patriotic Irishman and open to the need of reform. His next step was to the Governor-Generalship of Canada.

The Governor-General of Canada, like the sovereign whom he represents, is constitutional. He reigns and does not

govern. The last real act of government done by a Governor-General may be said to have been that of Sir Edmund Head, who, in 1858, refused to dissolve Parliament at the instance of his constitutional advisers. The position is now little more than one of social headship; headship, at least, of the wealthy and fashionable classes. Of this Dufferin made the most. It suited both his taste and his capacity. He gave his office an air of Royalty and Government House the aspect of a Court, which they had not before worn. He also greatly improved upon his predecessors in the number and the rhetorical elaboration of his public speeches. He went away in the happy conviction that he had made a deep and lasting impression on the minds of the Canadian people. Perhaps his less regal and less oratorical but very shrewd predecessor, Lord Lisgar, could he have been cited, would have put in some qualifying words. In the scandalous and angry case of the Pacific Railway scandal the Governor-General was accused by the Opposition of having allowed his prerogative to be abused by the impeached Minister for the purpose of baffling inquiry. Nor could the charge be said to be without color, tho Lord Dufferin no doubt persuaded himself that he was taking the constitutional course.

From Canada, the servant of Empire was sent as Ambassador to St. Petersburg, there to unravel some complications arising out of the Berlin treaty, perhaps still more to conciliate by his personal tact the Czar, who had been irritated by the armed interposition of England in the war between Russia and Turkey, and by the generally anti-Russian policy and menacing language of Beaconsfield. In this he seems to have succeeded, as he usually did, when personal tact and persuasiveness were the things required. He looks in at the trial of the Nihilists:

"One of the men was very distinguished looking, with a countenance of a high type. The others were merely moujiks, one woman, a disreputable looking Jewess, and Peroffsky, the lady, a bosomless, sexless creature of the true Nihilistic type, with a huge forehead, small, intelligent eyes, and a hideous face."

On the general state of things in Russia he pronounces no opinion. But the

general impression is that of acquiescence in the existing *régime* and absence of sympathy with revolution.

From St. Petersburg Dufferin is transferred to Constantinople, there to try his diplomatic skill on the Sick Man baffling the attempts of the Christian powers to control him by concerted action have so long protracted the unspeakable rule of the "Assassin." At Constantinople he is witness of a strange scene.

"On reaching the great square which constitutes the inner court of the Persian Khan soon after sunset, we found the whole place illuminated with lamps and torches and ball fires, while a procession intended to represent the return of Hussein's family to Medina after his murder was marching round it. First came a number of men beating their breasts with a rhythmic motion, so as to produce a succession of 'thuds' which might have been heard a mile off. After these followed the horses of the martyr bearing his blood-stained armor. Then came a throng of Dervishes, lacerating their bare backs with steel whips, followed by two rows of infuriated fanatics, dressed in white shirts and armed with naked swords. They walked sideways in two linked lines facing each other, and at every step they gashed their skulls and foreheads with their swords until the blood streamed down in torrents over their faces, necks and white garments. Many of them became a red mass of gore, some of them fainted, and from some their swords had to be taken, so desperate were the slashes they gave themselves. The smell of blood filled the air, and the shouts and gestures of the Mollahs and priests who walked up and down between the two rows still further excited their madness. I could not have believed in such a sight had I not seen it."

The next mission was the settlement of Egypt after the insurrection of Arabi and the British occupation which followed, and which, tho professed temporary, soon showed that it would become perpetual. Here again the envoy showed his personal tact and his administrative power, reaping again an abundant meed of praise.

The Viceroyalty of India presented a problem which is thus stated by Dufferin:

"Through the mysterious decrees of Providence, the British nation and its rulers have been called upon to undertake the supreme government of this mighty empire; to vindicate its honor, to defend its territories, and to maintain its authority inviolate; to rule just-

ly and impartially a congeries of communities, many of them widely differing from each other in race, language, religion, social customs and material interests; to preserve intact and unimpaired the dignity, rights and privileges of a large number of feudatory princes; to provide for the welfare of a population nearly as numerous as that of Europe, and presenting every type of civilization known to history from the very highest to the very lowest; to safeguard and to develop the enormous moral and material British interests which have become inextricably implicated with those of the natives of the soil; to conduct its administration in a way to win the love, confidence and sympathy of races as keenly sensitive to injustice and wrong as they are ready to recognize kindness and righteous dealing."

Added to this was the ever-burning question of relations with Afghanistan and the task of conjuring the fear of Russian invasion, that "nightmare of Indian officials," as Dufferin truly calls it. The Viceroy had an interview with the Ameer, and shows in his treatment of that rough potentate a personal tact which he had shown in dealing with the refined diplomats of Europe.

Dufferin dwells earnestly on the necessity of union, concord and good fellowship between the races, European and native. He unfortunately fails to show how this happy result can be brought about between the conqueror and the conquered; between the Occident and the Orient; between two races physically severed by nature, and one of which, the ruling race, is but a sojourner, since its children cannot be reared in India. Improved facilities of communication with the mother country of the ruling race appear to have rather had the effect of increasing the estrangement.

About the most notable incident of the Roman Embassy was a feat of horsemanship of which, as of his nautical skill, Dufferin was evidently very proud:

"At last we have had something like a run, the first I have seen. It was almost like England, that is to say, the fox and hounds went away straight, and one had to jump the staccionionatas, or be left behind. As a consequence, there were only five of us up at the first check, and one of the post-and-rails was a very high one, with a drop on the other side; but I was determined to do my duty to my Queen and country, and my horse cleared it beautifully, tho it stopped most of the field. This achievement has been the talk of the town,

for they make a great deal of very little here. But the person who was most pleased was the huntsman. The master, however, greatly startled me by the way he turned a compliment. He said: 'You were an example to all of them; there were dozens and dozens of young men behind you.' As I always feel five and twenty when I am on horeback, to hear the 'young men' placed in one category and myself in another was an unexpected blow, and I have not yet quite got over it."

The French Embassy was Dufferin's last office. This was under the Republic. He had become familiar with Paris under the Empire, and had conversed familiarly with the Emperor, of whom he says:

"His manner is very pleasant and soothing from its extreme composure. As he goes on you can fancy yourself in an armchair watching magical wreaths of smoke turning into shape and form over some far-away dream-land. It is this tranquility of manner which gives him such ascendancy over the volatile French. Combined with his belief in his own destiny, which the Empress told me never wavers, the wonderful success which has hitherto attended his scheming and dreaming is more easily to be understood."

He had at the same time an interesting talk with Flahaut, Napoleon's aide-de-camp at Waterloo:

"I was well acquainted with Count Flahaut, who was Napoleon's aide-de-camp at Waterloo. I asked him what happened when the last charge of the Imperial Guard was repulsed. He said he was close to Napoleon at the time, that he was carrying Napoleon's field-glasses, that Napoleon took them from him, and with their assistance watched the advance of the troops up the hill. After a time he handed them back to Flahaut, saying: '*Je crois qu'ils sont mêlés*,' and, turning his horse's head, rode at a foot's pace off the field. I asked Count Flahaut whether he showed any outward signs of the despair which at that moment must have overwhelmed him. He said he appeared to be absolutely destitute of emotion, and he added: 'In fact, he was so dead tired and so physically exhausted that he was incapable of emotion.'"

This is somewhat at variance with the common account which makes Napoleon say "*A présent tout est fini*," and ride rapidly off the field.

This life, so fortunate and brilliant in its course, was destined to end in gloom. Strange to say, with all his diplomatic address and administrative capacity,

Dufferin never had been a shrewd or careful man of business in his own concerns. This had appeared in his dealings with his own estate. By allowing himself to become entangled in the management of a fiscal corporation, which

foundered disastrously, he brought upon himself what he calls an "indescribable calamity," which, however, as was universally admitted, involved no stain upon his honor.

TORONTO, CANADA.

## The Road of Dreams

BY WILLIAM HERVEY WOODS

'Tis no dim woodland way  
With floor of grass broidered with fringed  
pools  
Of filtered sunlight, where dame partridge  
schools  
Her brood at dusk o' day,  
Nor orchard path, o'er which in odorous bow-  
er  
The oriole blooms, a winged and singing flow-  
er,  
New blown in new blown May.

It is no clanging street  
Due east and west unwandering, bare and  
straight  
Down 'twixt the housetops as the path of  
Fate,  
Where is cold Mammon's seat,  
And staring changeless as a blind man's eyes  
The endless windows row on row arise  
Above the hurrying feet.

Yet doth the dream road lie  
Alike in field and town; twin bands of steel  
On bedded logs, down which on clanking  
wheel  
The long freight trains go by,  
By day and night, and travelers grand and  
strange  
And visions bright this grimy pathway range,  
To a discerning eye.

What, think you, passes now,  
Just giant sawlogs? Nay! I see a tall  
Pine tree that tiptoe on Tacoma's wall  
A thousand years his brow  
Lifted cloud-high, to watch through devious  
miles  
The ever changing, swift, far flashing smiles  
That Puget's waves endow.

Yon dull heaps are not coal,  
But leaf and flower and frond—poor smoth-  
ered things  
Mummied and buried, like old Egypt's kings,  
When earth from pole to pole  
Was ceaseless summer: these great blocks of  
stone  
Are templed Karnak, or walled Babylon,  
As past me now they roll.

And more than new-reaped grain  
These dusky vans bring by; I see the surge  
Of billowy wheatfields rippling toward the  
verge  
Of wide horizons; plain  
Comes a keen whirr of harvest wheels; and  
kind  
Nature in new lands far brings back to mind  
The Age of Gold again.

These gossip airs that tell  
What summer fruits are passing, tell not all—  
They bring, unknown, a garden with its wall  
And orange trees that spell  
Summer and Southland; and the vanished face  
That blessed my garden wears the old, old  
grace  
My childhood loved so well.

So at the open door  
Musing, I watch the dream-world rolling by,  
Old scenes, and faces dead that cannot die—  
And, all my wanderings o'er,  
Rest by the roadside; or, if I must roam,  
Make but short journeys, travel still at home,  
And mine own soul explore.

BALTIMORE, MD.

# Literature

## Ireland's Far Eastern Tropics

THE fourteen chapters of Mr. Alleyne Ireland's work on the tropical colonies of the Orient\* have all previously been published in British and American periodicals. The writer prepared them during the course of a survey of the British, Dutch, French and American possessions in the Oriental tropics as Colonial Commissioner of the University of Chicago. In this latter capacity he has prepared a report of ten or more volumes, soon to be issued. The book under review, therefore, is merely a sort of journalistic compilation, which the author puts forth modestly, aware, as he states, "of the limitations of these studies." Judged on that basis, the book is certainly a very interesting production and should be very useful in stimulating thought and inquiry on the main lines of colonial policy—all the more so, perhaps, for Americans, in that the author is very critical of the American program in the Philippines.

Two-thirds of the book has been given to the British, French and Dutch possessions and one-third of the space to the Philippine Islands. In raking over the Orient for instances of success on the part of British administrators, partly it would appear in order to hold them up for American imitation, Mr. Ireland has often been compelled to find, in consequence of his own evident intention to be fair, that the mistakes which he believes he has discovered in the Philippines have in almost every case been made or are being made in some one or other of the neighboring British colonies. Magnifying the current disorder in the Philippines, and apparently holding the new government there at fault because it had not overcome ladronism in the four year since the insurrection was practically ended, he tells in another part of his book how disorder lasted for years in Burma, the British

military policy in which country he apparently thinks should have been copied in the Philippines. He would seem to require, even were American policy in accord with his views, that the Americans should have achieved in a half decade in the Philippines all the best accomplishments of the British in each one of the possessions which they have administered from several decades upward.

But, and this "but" is the important thing in disclosing the author's viewpoint, Mr. Ireland believes the American *policy* in the Philippines to be vitally and essentially wrong in conception. His own viewpoint is revealed in the introductory chapter, where, after expressing his opinion that Western methods are best for the tropics and people of the tropics, and that "if the administration is to be conducted on Western lines, the control must rest with white men," he says this is a conception which,

"if accepted in good faith, places upon the colonizing powers a solemn duty and a grave responsibility for the honest and efficient administration of the affairs of people *whose development has reached the limits imposed by inexorable natural laws.*"

Mr. Ireland, moreover, judges the status of a people entirely by their economic conditions, and would have the policy of a government, it would appear, directed primarily, if not solely, to fostering trade. Therefore, he ranks the Philippines and the Filipinos comparatively low in the scale of tropical countries and peoples; he looks upon the governmental policy, which devotes first attention to the public schools, as a mistake, and he regards the construction of roads and bridges as the most important internal work to be undertaken in a colony. One might, by going into detail, show that he has made some rather considerable errors of fact in dealing with Philippine conditions and governmental achievements through following the information of Englishmen in the islands; that most of his comparisons of

\* THE FAR EASTERN TROPICS. By Alleyne Ireland, F.R.G.S. Boston: Houghton, Mifflin & Co. \$2.00.

the Philippines with distant, different and generally insignificant British colonies are essentially unfair, and that he is not so familiar with the actual status in the Philippines as he might be expected to have made himself. Above all other things, he is very complacently ignorant of the past history of the Philippines, and dismisses the period of Spanish rule (wherein some things were achieved toward the advancement of the Filipinos which Great Britain has never yet achieved in any of her colonies) with the contemptuous phrase "three centuries of Spanish misrule." His strangely selected Philippine bibliography and his statement that he was

"unable to find any reliable statistics regarding the finances of the Philippine Islands during the period of Spanish rule"

tell the whole story and explain to the student of Philippina a great many of Mr. Ireland's easy judgments.

### A Library of Art

THE making of that excellent set of monographs known as the "Library of Art"\* goes forward apace and with a free exercise of individuality by the contributors that is noteworthy among a series of this kind.

In Mr. Lethaby's book we have an admirable summary of the two chief styles of medieval art—the eastward culmination, or Byzantine school, and the western, or Gothic. He sees that "the long and eventful period, the thousand years from A. D. 300 to 1300, from Roman to Renaissance art, is yet a perfectly organic one;" and he traces in the existing monuments of architecture and its allied arts of decoration—the only important remains of medieval art—how that period grew, from a change in the spirit of classical art, produced by Oriental mysticism and Christianity, which supplied the newer and greater human interest, into the first great medieval school in the East; and how Eastern forces acting on the West through a

thousand years of receptivity produced the phenomena of Gothic art. His survey of medieval art as a whole, both historically and in its geographical distribution, clearly sustains his hypothesis that in view of the slow preparation for, and the rapid passing of, western Gothic art, and considering the sudden and entire breakdown of its traditions and ideals, its underlying causes "are to be found in a long infiltration of the Oriental spirit to the point of saturation, and then the bursting out of the new, yet old, energy shaped to northern requirements."

Miss Cruttwell's *Verrocchio* is first of all intensely interesting—it makes good reading—and it is at the same time a valuable contribution to the popular literature of Italian art. She rescues Verrocchio from the subordinate position to which he had been banished by certain critics, and limns him as one of the greatest creative masters of the Quattrocento, "inferior to none of his contemporaries in scientific accuracy and technical ability, in breadth of vision and imaginative power only to Donatello and Leonardo." Never pedantic, her study is yet thorough, and her abundant enthusiasm in appreciation is tempered by judicious statement of fact and reason for her interpretations and attributions. Her praise of the heroic Bartolommeo Colleoni in Venice as the finest equestrian statue in existence is, perhaps, a bit too high, tho that masterpiece is undoubtedly the noblest of its kind produced by the Renaissance in Italy. But her book is altogether the best on Verrocchio that we have, in English at least. There are forty-seven reproductions in fairly good half-tone blocks of works by Verrocchio and others.

After one has fairly gotten through the fifty-page metaphysical and esthetical confession of faith which forms the introduction to Mr. Moore's consideration of *Albrecht Dürer*, and has read on in the biographical and critical parts which follow, one perceives that the author has a studious and thoughtful conception to present of the great master of Nuremberg whose religion determined his artistic character. Beauty for its own sake did not have his allegiance. "It is for the intense energy of his line, combined with its unique assurance, that Dürer is

\* MEDIEVAL ART, *From the Peace of the Church to the Eve of the Renaissance*, 312-1350. By W. R. Lethaby. VERROCCHIO. By Maud Cruttwell. ALBRECHT DÜRER. By T. Sturge Moore. GIOTTO. By Basil de Selincourt. London: Duckworth & Co. Imported by Charles Scribner's Sons, New York. Each \$2.00.

most remarkable." While Mr. Moore does not lose sight of these facts, his book is rather overloaded with vain speculations as to what Dürer might have done if after his visit to Venice he had remained permanently under Italian influence. He does not seem to realize that the environment of the German Reformation was absolutely essential to the development of Dürer's genius. Mr. Moore avows no results of new researches into his subject. Yet his book is worthy of its place in the series by reason of his sympathetic interpretation of Dürer's work. The numerous illustrations, including reproductions of many of Dürer's drawings, are good.

Worthily sympathetic also is the treatment accorded by Basil de Selincourt to Giotto and the early Florentine school. While the praise lavished on "the father of Italian painting" may seem at first extravagant, by the detailed consideration of his remaining works the achievement of Giotto looms large, and our author succeeds in placing him for the student in the right relation to his people and his time:

"A true son of Florence, worthy in the power and scope of his genius as well as in the comprehensive nature of his idealism to be the fellow citizen, as he was indeed the friend, of Dante."

## Von Mach's Greek and Roman Sculpture

THE author shows in this book\* the excellences of his former work. He seeks everywhere the "spirit and principles." He states his conclusions boldly and independently. He loves his theme; sometimes perhaps he indulges in excess of details and philosophizing for his public.

When he simply describes he is most admirable. The descriptions of the Mausoleum Sculptures and the Farnese Bull are excellent; also the few pages which characterize the spirit of the sculpture of the fourth century (pp. 181 ff.)

\* A HANDBOOK OF GREEK AND ROMAN SCULPTURE. By Edmund von Mach, Ph.D., author of "Greek Sculpture: Its Spirit and Principles." (To Accompany a Collection of Reproductions of Greek and Roman Sculpture.) Pp. xi; 419; Appendix ix. 500 Plates and 46 Text Illustrations. Bureau of University Travel, Boston, 1905. Handbook, \$1.50. Collection of Plates, \$4.00. Both together, \$5.00.

The bibliography is full and praiseworthy; so also are the notes preceding the discussions, giving the provenience; the circumstances of the finding, the condition at the time, and the restorations that have since been made.

On pp. 43-45 a frieze of the Treasury of Knidos is differentiated from a frieze of the Treasury of Siphnos. The fact is that M. Homolle at first called the building to which the frieze belonged the Treasury of Siphnos, but later concluded that it *was* the Treasury of Knidos. Thus the author's "strong contrast to the [supposed] earlier Delphi frieze" is left in the air. We have to do with but one frieze.

Credit is not given (p. 42) to H. Schrader for putting together most of the pieces which made up the group of Athena and three giants in the east gable of the Old Athena Temple. One would think from the description that Studniczka did it all. Few will agree with von Mach that the date "soon after 550 B. C. seems to accord with the style of the group." See Schrader's monumental article in the *Athenische Mittheilungen*, 1896.

The claim for 550 B. C. comes strangely from one who puts the Calf Bearer at 536 B. C., which is practically universally conceded to come very closely after the great poros groups, the technic of which is practically identical with that shown in the Calf Bearer. If we do not hold fast to this we are surely "all at sea."

In the Typhon ("Bluebeard") gable Typhon is still spoken of as fighting with Zeus. But Wiegand's careful study has placed Zeus in the other gable.

It is said of the Selinus metopes in general (p. 47) that "they carved the nude parts of the women separately in white marble, adding them to the rest, which had been carved in limestone." The fact, however, is that these marble additions occur only in Temple E. Of the Selinus metope of Europa and the Bull it is said: "There is an almost human expression on his face." This is fancy run riot. In another metope Perseus is called "Herakles," altho he has winged sandals, to which Herakles never aspired.

A certain number of errors naturally

creep into any large book, but when, on p. 85, "apotygma" creeps in six times for "apoptygma," it amounts to more than a typographical error. The same may be said of the name Damaphon, which occurs on the plates three times, altho it is given correctly in the index as Domophon.

Kekropes is used five times for Ker-kopes.

**Modern Theory of Physical Phenomena.** By Augusto Righi, Professor of Physics in the University of Bologna. Translated by Augustus Trowbridge. New York: The Macmillan Co. \$1.10.

**Radium Explained.** By W. Hampson. New York: Dodd, Mead & Co. 50 cents

The reader whose formal education was finished some years ago but who takes an intelligent interest in scientific discoveries is naturally somewhat confused by all this talk nowadays about ions, electrons, wireless telegraphy, radio-active matter and Becquerel rays. It sounds like a contradiction of all that he learned at school to hear of the decomposition of elements, of ever-burning lights that consume no fuel, and of particles of matter devoid of mass. What he needs to know is very satisfactorily given in both these books, which contain a connected description of the recent marvelous discoveries in electricity. The language is simple and clear and should be comprehensible to any one with the ordinary knowledge of chemistry and physics. Professor Righi's book is the more comprehensive and scientific. Mr. Hampson's is more limited in scope and more elementary in style.

**Essays for the Day.** By Theodore T. Munger. Boston and New York: Houghton, Mifflin & Co. \$1.00.

It is safe to say that nothing which Dr. Munger writes will be allowed to pass unnoticed, but it is especially safe to say that the six papers which we have in *Essays for the Day* ought to be read with care, for they can be studied with profit. They are: The Church, Some Immediate Questions; The Interplay of Christianity with Literature; Notes on "The Scarlet Letter"; The Secret of Horace Bushnell; A Layman's Reflections on Music, and "A Cock to Æsculapius."

The first of these, while sketching an ideal for the Church with the university as model, is an eloquent plea for that breadth of thought which alone can form the basis of a universal Christianity. Much is said now-a-days about union among the various Christian organizations, but no sooner do we approach the discussion of the terms of such union than we are face to face with questions of dogma, technicalities and forms. Each "church" is quite ready to receive the others into union and communion if its own creeds, confessions, formularies and the like are made the basis of fraternity. Dr. Munger has a more comprehensive and enduring foundation for unity in that relation of humanity to divinity which demands well-doing as its expression. The essay on the Interplay of Christianity with Literature is one of remarkable force. The author shows how Christianity, inseparably connected with the grand literature of the Old Testament, finds fitting expression in that of the New Testament; how it continues that expression in the Ante and Post Nicene Fathers; how it even rehabilitated Greek philosophy in a universal garb. In criticisms of striking value he traces the ennobling influence upon humanity of Christianity, its unworldliness, its spirituality, in the literature of later times, appealing to Dante and Milton, Shakespeare, Goethe, Byron, Shelley and Burns, Tennyson, Browning and Matthew Arnold.

**Recent Discoveries in the Forum.** 1898-1904. By an eye-witness, St. Clare-Baddely. A Handbook for Travelers, with a map specially made for this work by order of the Director of the Excavations, and 45 illustrations. New York: The Macmillan Co. \$1.25.

The excavations carried on in the Roman Forum during the last six years have rivaled in importance the great and surprising excavations conducted on Greek sites during the last quarter of a century. But one rises from a reading of this description of a great work with the impression that St. Clare-Baddely was not the man best fitted to tell the story. It is a theme eloquent in itself; but in his hands it loses its eloquence. The expression is so poor that one rarely reads

so small a book with such great difficulty. The writer seems to affect odd and old-fashioned words and phrases. "Carven," "curven" and "paven" are extremely frequent. "Strewment" is perhaps put in for effect. "Boustrophedia" supplants *boustrophedon*. But altho the presentation of the theme is not altogether pleasing the results of the work are so important that almost any presentation of it must be interesting. The forty-five illustrations contribute materially to the understanding of the narrative, and allow us to see the monuments of old republican Rome below the much talked of Niger Lapis.

**The Rise and Decline of the Free Trade Movement.** By W. Cunningham, D.D., F.B.A. New York: The Macmillan Co. 75 cents.

Professor Cunningham is one of the most noted economic historians of England now living, and any work produced by him is sure to command respectful attention. The present book is a direct outgrowth of the agitation started by Mr. Joseph Chamberlain for a return to some form of protection. Economists of the "historical" school and economic historians have always been skeptical in their attitude toward the postulates, methods and results of theoretical political economy, particularly the doctrines of *laissez faire* and free trade; it was, therefore to be expected that Professor Cunningham would be found among the advocates of a change in the economic relations of England toward other countries. After a condensed and somewhat colorless historical survey setting forth the changes in England's economic policy from the days of Adam Smith and the younger Pitt to the triumph of free trade, the author comes to the crux of the whole question: Is one-sided free trade expedient for England? He shows that under the *régime* of free trade English exports have increased greatly until 1870, but that since then, altho there has been an absolute increase, yet the ratio of increase has greatly diminished; that part of this diminished increase is due to the increased demand for English coal, a commodity which must sooner or later be-

come exhausted and which, moreover, goes to feed the industry of England's rivals; that Germany and the United States are progressing industrially much more rapidly than England; that the area of land devoted to the cultivation of corn has shrunk over three million acres since 1871, and that the national physique has suffered deterioration in the crowded cities. For these and other reasons the author concludes that the

"Economic organization of the empire is needed, not only to introduce a greater measure of free intercourse within its bounds, but to be a bulwark against the evils of cosmopolitan competition."

**Early Eastern Christianity.** St. Margaret's Lectures, 1904, on the Syriac-Speaking Church. By F. Crawford Burkitt. New York: E. P. Dutton & Co. \$2.00.

**Islam and the Oriental Churches: Their Historical Relations.** Students' Lectures on Missions, Princeton Theological Seminary, 1902-03. By William Ambrose Shedd, M.A. Philadelphia: Presbyterian Board of Publication and Sabbath-School Work \$1.25

These two works are concerned with the Christianity of the East, its romantic and tragic history, its influence upon Islam and its responsibility for the rise and spread of that faith. Mr. Burkitt, Lecturer in Paleography in the University of Cambridge, confines his attention to Edessa, the ancient Christian kingdom lying east of the Euphrates. His interest is literary and antiquarian, and he tells of the early bishops and the troubled fortunes of the Church, of the Syriac version of the Bible, and the interesting and curious literature of Syriac Christianity. Mr. Shedd is an American Presbyterian missionary to Persia, and he writes of the influence of Oriental Christianity upon Islam and the effect of Mohammedanism upon the Churches of the East with the sympathy and warmth of a man who feels himself a part of the great religious struggle whose earlier fortunes he records. Nevertheless his spirit is fair and impartial, and his research has been thorough and scholarly. His insight into the course of history in the Mohammedan lands is penetrating, and his views on present policy are broad and statesmanlike. In his hands Islam and the various forms of Christianity

face to face in the East are a spectacle of great interest, a half-told drama as to whose further story it is fascinating to speculate.

**Words of Koheleth, Son of David, King in Jerusalem.** Translated anew, divided according to their logical cleavage and accompanied with a study of their literary and spiritual values and a running commentary. By John Franklin Genung. Boston: Houghton, Mifflin & Co. \$1.25.

Professor Genung thinks that Ecclesiastes was written about 200 B. C., that it is the work of one author, and "is conceived in one supreme idea, one homogeneous conviction," and that it preaches the joy and blessedness of life for a man who seeks no reward outside himself and his work. He discards violently, and with such phrases as "syndicated Bible-making," "distraction theory," all explanations and theories regarding the book which have recently been put forth. He argues skilfully and earnestly for the unity of the book and the value of its message, but nevertheless Ecclesiastes remains the riddle of the Old Testament, and not anywhere near so Christian a book as it is in the interpretation of Professor Genung.

## Literary Notes

A **POCKET** dictionary of French and English, measuring only  $2\frac{1}{4} \times 3\frac{1}{2}$  inches, is published by Dutton & Co., New York, at 50 cents; also two quotation books, nearly as small, at the same price.

....A very successful attempt to give the theory of evolution in plain and simple language is "The Evolution of Man," by Wilhelm Boelsche, published by the C. H. Kerr Company, Chicago, at 50 cents. It traces back the line of descent from man to the primitive protozoon, explaining the reasons for each step according to the latest evidence.

....Miss Elisabeth Luther Cary, author of "Alfred Tennyson," "Robert Browning" and other books, has assumed the editorship of a new art magazine to be called *The Scrip*, published by Moffat, Yard & Co., New York. The first number will be issued in September. With the passing of *The Art Interchange* and *The Art Amateur*, there ought to be a good field for a low priced magazine of art.

## Pebbles

WHAT is the difference between a hanging and electrocution? It is the difference between a raisin' and a current.—*Current Literature*.

Behind the bars  
The Beef Trust Czars  
Are weeping o'er their wounds and scars;  
While on the street,  
The People greet  
Each other saying: "It is meet."

—*Life*.

### STORE REPORTEE.

"Do you keep eggs?" asked a young man. "No; we sell them," replied the storekeeper. "Well, how are you selling them to-day?" "We're selling them as usual—in their shells." "Oh, I thought you were selling them for money. Have you any farmers' eggs?" "No; but we have some hen's eggs. How many do you want?" "Did I say I wanted any?"—*The American Grocer*.

....It was at a New England county fair, and two women a little beyond middle-age were seated under a shade tree by the entrance gate, when one was heard to say to the other: "So you've been out to St. Louis to the big Exposition. How did you like it?" "Well, I enjoyed it first rate—better than I expected to. You see, I didn't care nothing about goin' in the first place, but Silas he was dead set on goin' an' was bound I should go with him—said he wouldn't go unless I did—so I went just to git him off, for I could see that he wanted to go the worst way. An' I was real glad I went, in the end, for when we found that Si's own cousin, Luella Day, lived within sixty miles of St. Louis we concluded to go out an' make them a visit, an' we did have a real nice time. She give me a new reseat for makin' marm'lade out o' green grapes an' another one for tomato pie. You wouldn't think tomatoes would make a pie fit to eat, but you'd be s'prised to know just how good a pie they will make. Then one day while we was in the art room at the fair a woman come in with a brown Henrietty cloth dress an' cape, an' it give me an idee of just how to make over my brown Henrietty cloth this fall. An' a woman I fell in with one day when I was resting in the shade on a bench told me how to take all kinds of grease spots out of any kind of goods, and a woman in one place where cooking demonstrations were being given told me how to make lovely batter cakes out of stale bread an' oatmeal flour. Live an' learn is my motto, so, after all, I was kind o' glad I went, but, for real enjoyment, I don't think the St. Louis show begins to come up to our county fair."—*Lippincott's*.

## The United States for Peace

No more notable proof could be given of the entrance of the United States into the circle of world Powers than the general expectation, now realized, that President Roosevelt would be called on, when the time came, to bring Russia and Japan together to consider terms of peace. Such an idea would have been incredible ten years ago. It is the war with Spain that made us no longer a negligible quantity in world politics. Previously our insistence on the Monroe Doctrine had given us influence on the Western Continent. The conquest of the Philippines made our voice heard in the Old World. Whether the loss of our praised isolation is an advantage to us depends on how we use our new influence. Thus far it has been well used. It has been used with initiative courage, as in our insistence on the open door in China and in our effort to limit the field of conflict. Now the nations turn to us to ask Russia and Japan to lay down their arms. Thus far our new international duties have been well and most honorably performed. The talk of the "big stick" is the sheerest nonsense.

The crushing naval defeat has persuaded Russia to consent to listen to terms of peace. No longer does she talk of settling the terms of peace in Tokyo. She does well to listen now, and she will do better if she makes what terms she now can. She can better afford to end the war now than can Japan. We had anticipated that the war would not come to a conclusion until Japan had occupied Saghalien and had invested Vladivostok by land and sea. Even now, since the destruction of the Russian fleet, we have expected every day to hear of Japanese armies landed on Russian territory, as a basis for more onerous conditions of peace. Because we made the blunder of not occupying the Caroline Island during the Spanish War, we therefore could not claim them afterward, notwithstanding our interests there; and so Japan's

chance of securing territory east of the Amûr River is much reduced by her failure to put an army about Vladivostok, altho she can hardly fail at least to claim Saghalien, which was some years ago taken from her by Russia. It now looks as if Japan might have to be content with demanding a heavy pecuniary indemnity from Russia, while insisting that Russia entirely withdraw from Manchuria. Indeed, apart from Japan's full protection of herself against an encroaching enemy, China would seem to be the chief beneficiary by this war. She also is saved from repeated invasion; she finds Manchuria restored to her control; and she is sure to enter upon a new history as a mighty nation, adopting modern civilization, creating a new patriotism and able to protect herself. The naval battle of Tsushima Straits will be an epoch in the history not only of the East, but of the world.

We are not of those who fear that Japan will develop a conceit that will make her a nuisance among the nations. Great power creates new responsibilities and sobers a civilized nation. It was weak China and ignorant Korea that were the most conceited of all nations. When a nation develops commerce and manufactures it gives pledges to fortune and requires peace. But neither Japan nor China is likely long to submit in quiet to being treated insolently by other nations, as we now treat the Chinese by our legislation. Our immigration laws are an insult to China, and China will learn how to retaliate to our serious loss.

But if the result of the war will greatly affect China, it will have an equal influence in Russia. The loss of life and treasure is a cheap price to pay for what is sure to be her advantage. Already the power of the autocracy is shaken. Were ever such words heard in Russia as those which the conference of municipal councils has just addressed to the Czar? The people have found their voice, and the throne quakes. It is an epoch in Eastern Europe as well as in Eastern Asia. Keep your eyes on Russia, where

the last mighty seat of despotism is crumbling to its fall. There is a fine, eager population that is likely to give us new and valuable lessons in statecraft and letters, while a better era will dawn in the reformed Russian Church. Togo's victory is likely to create almost a new world. We thank Mr. Roosevelt for his courageous and wise call for peace, and his advice that the two Powers at war consider their terms of peace by themselves, and with no interference by other Powers. If this is what is called "shirt-sleeve diplomacy" give us more of this direct sort.

### Philadelphia's Ring and Its Friends

WE said two weeks ago that if the people of Philadelphia were to secure permanent freedom, their ostracism of civic traitors must not be confined to the tools placed in the Councils by the bosses. These municipal legislators, a majority of them unknown outside of their own wards, yielded to the pressure of a relentless social and business boycott. They were driven to desert the boss, his lieutenants and powerful allies. In sufficient numbers to support a veto, they surrendered to the Mayor and the people. Then was withdrawn that gas lease which, at the command of their former masters, they had accepted and approved by a vote of nearly ten to one—a lease the monstrous injustice of which had caused a popular insurrection, a lease of which Mayor Weaver had said that "a more iniquitous measure was never forced upon a free community."

Who had proposed and sought to fasten upon Philadelphia for seventy-five years this contract, the offering and the acceptance of which were so earnestly denounced by the public and were characterized by the press with one voice as an offense "so daring that to honest men it seemed incredible," and "an outrage standing unequalled and unapproached in the history of municipal crime?"

The lease was proposed by the United Gas Improvement Company.

To readers of the daily record of the war against Philadelphia's ring the names of Boss Durham, of Senator Penrose (his near friend and supporter), of Costello and Smyth (the removed heads of Departments), and, possibly, of some of the Councilmen, are now familiar; but do they know the names of the officers of the United Gas Improvement Company? Here are the Directors:

|                     |                    |
|---------------------|--------------------|
| Thomas Dolan,       | Samuel R. Shipley, |
| Clement A. Griscom, | W. W. Gibbs,       |
| Samuel T. Bodine,   | Randal Morgan,     |
| George Philler.     |                    |

Mr. Dolan is president, Mr. Morgan is a vice-president, Mr. Bodine is a vice-president and the General Manager. Thomas Dolan has been widely known as a manufacturer of worsted goods and as an active defender of a high protective tariff. He is a Director in many companies, a member of the national committee to promote the University of the United States and a trustee of the McKinley Monument Association. In the list there is no other name so well known as that of Clement A. Griscom, whose son is now Minister to Japan. Mr. Griscom owns the Red Star steamship line. He was at the head of the great International Mercantile Marine Company (or Atlantic Steamship Trust), and is now, we think, chairman of its board. He is a Director of the United States Steel Corporation, the Pennsylvania Railroad Company, the Cramps' Shipbuilding Company, the Mercantile Trust Company (of New York) and of several other trust companies and banks. Samuel R. Shipley has been President of the Provident Life & Trust Company for 35 years, and in biographies published with his approval is said to be "identified with various benevolent institutions of Philadelphia." George Philler is president of a national bank and a Director of several other financial institutions. The other members of the board are also connected with prominent companies. These are the gentlemen who proposed the gas lease and who were induced by a citizens' uprising to withdraw it when a successful veto was impending.

Mr. Winston, chairman of the Committee of Seventy, has narrated his experience with several prominent lawyers and financiers whom he urged to assist the committee in its work for reform. They gave excuses. They were engaged on the other side, or their financial interests were involved with those of the officers of the United Gas Improvement Company. He came to New York to employ counsel for the committee. "You have no idea," said he, "of the ramifications of a great corporation like this. They extend into every walk of life in Philadelphia, into the banks, the trust companies, the business houses, the lawyers' offices, and even the homes."

Now let us see in what ways the influence of the supporters of Philadelphia's ring has been exerted, either intentionally or thoughtlessly, for the injury of the city and its people. Not all the harm that has been done has been of a financial character. The people have been robbed by means of corrupt contracts and the like, but in connection with such robbery and with the wicked perversion of public funds there has been no end of fraud at the ballot boxes. In election frauds the policemen and other employees of the city have been required to be the chief agents. The police force has thus been debased and demoralized, and it has given protection to vice of the most revolting kind. The Red Light infamies of a few years ago in New York have been paralleled in Philadelphia by the White Slave traffic which the policemen and the authorities above them protected when Mr. Gibboney's Law and Order Society sought to end it.

By means of the police, under the compulsion of ring leaders who agree upon gas leases with great corporations, Philadelphia's 60,000, or even 80,000, fraudulent votes have been procured. Says the *Press*:

"The police organization has been used in the boldest way to promote and protect election crimes. Policemen were required to carry out orders or forfeit their places. They have had fictitious names registered from their own houses; they have been industrious in supplying fraudulent names from other addresses;

they have used their power generally to protect bogus registration; they have been used in the criminal service of piloting gangs of repeaters from one division to another, and at the polls they have been a menace to honest voters and a shield for fraud."

Under the direction of their superiors, the police have procured the aid of the disorderly houses and the hundreds of unlicensed saloons in this work. For such aid the pay has been protection. The worst dens of the White Slave traffic were places for the manufacture of fraudulent votes, and when the Law and Order Society attacked them the ring almost succeeded in making it powerless by bills introduced in the Legislature at Harrisburg.

Respectable financiers in Philadelphia who have taken a share of the ring's plunder, or promoted the ring's schemes, or declined, for reasons relating to their business, to assist in the work of reform, have much to answer for. They are in some measure responsible not only for the theft of public money that has enriched a gang of robbers, but also for the election frauds which made such theft possible, for the demoralization and debasement of the police, for innumerable violations of law, for much injustice and oppression and for the systematic official protection and encouragement of vice in its worst forms. Is there to be no punishment, no ostracism, for them? Ought not these men to be held up to public scorn in the hundred pulpits where the erring Councilmen have been denounced? Do not some of them more richly deserve public censure and contempt than the small men who voted for the gas lease, or even than the office-holders who made them vote for it?

## The Summer Hotel

THE problem of the summer hotel is growing more and more complex. There is hardly a cozy corner, a fine beach, a mountain view or a lake in the woods—all gifts of Nature to the common people—that is not taken possession of by a landlord, who is rightly named—he is lord of the land as well as of his hotel,

but he knows nothing of land culture, and he has no further interest in the locality than to exploit it for his own interest. He comes in the season when he can gather in the shekels. With an army of outsiders he takes possession of the whole country, only to vanish as soon as it is no longer possible to induce people to look at Nature through the landlord's eyes. For the most part the appurtenances of these sporadic hotels include nothing which cannot be easily had at a quarter of the cost, for the most part, by people at their homes.

Fifty years ago it cost but a trifling sum to enjoy the White Mountains and the Maine lakes, while the Thousand Islands were as Nature made them, for the common people. Those who chose could visit the Catskills and similar places at a cost of about five dollars to ten dollars a month. At present the summer hotel will offer you the privileges of such localities at four or five times this sum per week, and those who prefer to save their money, or do not have it to spend, can enjoy these gifts of Nature only under the shadow and mortification of high fashions set by gorgeous hotels. If you want style and cost and high living today you will find it in the woods.

The summer hotels, rivaling each other with keen, commercial competition, are driven to methods of fraudulent advertising, that their unfortunate guests discover too late to escape the consequences. Each one of them sets forth "the benefits to be derived from a sojourn, however brief, in this one house," and which alone insures to the guest "perfect service in all departments, immunity from dust, flies and mosquitoes and all other possible annoyances." One result of this sort of advertising has been to pervert the taste of the people and lead them to seek high living during vacation, rather than simple living—in fact, to go to the heart of Nature in order to find no Nature at all, but art and conventionalism. The result is the loss of all that recuperation, as well as rest, which should come from close association with the brooks and the trees and the mountains.

But we think that worse is the creation of a great family of tourists, always on the go, never really enjoying anything, never fitting into Nature's moods, to re-

create themselves, but flitting from point to point all over the country, dragging their children about, until they all go home fagged and none the wiser or better. Burroughs speaks of a section he visited as "tourist infested." These professional wanderers and superficial sight-seers write letters and newspaper articles, professing to describe the places they visit, but they really have studied nothing and seen through very little; so that their descriptions amount only to descriptions of made conditions—artificial, "summer hotel" conditions. They can tell you nothing of the social and agricultural affairs of the country, nor of the outlook for home-builders. They straggle from point to point, generally unhappy, always in haste, and frequently settling into the profession of chronic grumblers.

It is with intense regret that we are compelled to call attention to another possible feature of the summer hotel, as drawn elsewhere in a most realistic way in this number of *THE INDEPENDENT*. The picture is a shameful one, that shows the methods used to decoy our best class of girls from schools and homes, and even from the colleges, to be surrounded by degenerating if not positively destructive influences. If only one half the story told by our correspondent is fact—and we believe it to be absolutely true as told from beginning to end—there would be enough to stir the people for a remedy. Good and true mothers and fathers should bear in mind, certainly not that all our country resorts and summer hotels are selfish and heartless, much less morally dangerous, but that many of them are utterly unsafe places for their daughters to occupy the position of waiters. The picture drawn in our columns is one of the most pitiful we have ever spread before the public.

This whole business of summer hotels and summer resorts needs to call a halt. It is sharply overdone. Mammon has taken possession of our mountains and commercialism controls our trout brooks and lakes. The story tells painfully upon those parents who feel compelled to spend much time at such places, because their children cannot otherwise be pacified. These people know very well that they are not taking their children into contact with the natural and the essen-

tially beautiful, but are bringing them under the influence of the artificial and artful.

Bear well in mind, however, that in this necessary criticism we have no intention to disparage those homelike retreats that are needed to accommodate outgoers during the hot months. Many well ordered quiet affairs of this sort exist—if only they can be differentiated from those that seek merely to demoralize vacation and reap a harvest from the crowd. Such resorts and hotels may be found scattered about the New England hills and elsewhere, where they seem to have been developed as the trees and the brooks are developed—natural features of the land and landscape. There are still old-fashioned hostelries possessed of the hospitable spirit and hosts who are personally interested in their guests. There are new fashioned landlords also who open their houses for the real welfare of their visitors. They do not take advantage of every opportunity to overcharge the purse, but carry on the hotel business as it used to be carried on by the Shermans and the Astors—as a social and family affair and for mutual well being. Nor have we any intent to disapprove those more gorgeous hotels which have rendered out of the way places accessible and done much to open the way to the heart of Nature. Many of these exist without being extortionate, while their standard of service is suggestive of refinement and probably does much to elevate the standard of living, while teaching us to make the most of the things about us. Such summer homes fit naturally into the needs of American life. Our country is so large and the scenery so varied that such retreats and vacation homes are an absolute requirement. All the more reason why we should crowd out the vulgar and discard sordid substitutes which, in every way pretentious, are equally insincere.

## The Equitable's New Plans

THE unexpected action taken on Friday last by the Directors of the Equitable Life Assurance Society has made a decided change for the better in the Society's condition, and the end of the controversy over this great institution's

affairs is now probably near at hand. In the plans for the future there is much to be commended and much to inspire confidence, altho the settlement is not an ideal one. The one-man power associated with majority control of the stock appears to have been eliminated, and provision is made for a mutualization more thorough and far-reaching than was contemplated in recent propositions for a change in representation.

Of Mr. Hyde's shares, 510 have been purchased by the Ryan syndicate, representing prominent policy-holders. It is true that this syndicate also represents powerful financial interests, but it will be noticed that it does not retain the voting power of the shares. This is given to the three trustees—ex-President Cleveland, Mr. George Westinghouse and Mr. Morgan J. O'Brien, Chief Judge of the Appellate Division of the New York Supreme Court—and they are to exercise it, first, in procuring the election of 28 Directors in accordance with the instructions of the policy-holders, and, second, in selecting the remaining 24 Directors in accordance with their own uncontrolled judgment. It would be very difficult, if not impossible, to select three trustees more deserving of the confidence of the policy-holders, and at least two of them are large investors in Equitable insurance.

Among the advantages gained, in addition to this mutualization, are a reorganization of the executive force under the direction of a new officer exercising plenary power, and—according to recent announcements—the adoption of savings bank rules to govern the character of the Society's investments. This change, if made, will preclude any considerable use of the Society's funds for the purchase of securities in which the new ruling forces are interested. It is impossible to avoid some speculation as to the future relation of the Society to those ruling forces, but the trustee plan will probably prevent it from becoming an intimate one.

The selection of Mr. Paul Morton for chairman of the board, with broad powers, leaves something to be desired. A manager more deserving of public confidence could have been found. The new plans, as they shall be developed, may

obviate any necessity for a legislative investigation, but the inquiry of Superintendent Hendricks should be completed and the results of it should be given to the public. The officers accused in the Frick report should, if guilty, suffer the punishment provided by law. The rehabilitation of the Society can best be promoted by an official public record of the offenses committed, followed by such punishment as the offenders deserve. It will not escape notice that the prominence of Mr. Ryan in the action recently taken tends, because of his associations and interests, to establish an intimate financial relation between the Equitable and another great company, the Mutual, mainly through the agency of subsidiary institutions.

### Libraries for Men

RAPID as has been the development of public libraries in the United States, they are as a rule of service to only a part of the community. They are useful to the women and children, but not so much to the men. Women have become our "leisure class" in the technical sense of the term by the transference of household industries to the factory, and it is very gratifying to see how generally they are spending the time thus gained in intellectual effort. Children are trained in the public schools to use the library, and they read its books with the greatest avidity and considerable discrimination. But the number of men who take books out of the town library or go to it for reference is very small.

There are two reasons for this: first, the men have come to think that there is nothing in the library for them, and, second, they are usually right in thinking so. Women use books as playthings; men as tools. When a woman reads a serious book it is usually to improve her mind; a man generally thinks that there are many other things which need improving more than his mind, and he reads to find out how to do it. Bacon, whose tabloid wisdom is popular because it is so convenient to carry in the vest pocket of one's memory, says: "Studies serve for delight, for ornament and for ability." Of these motives the first and the second are more apt to be dominant

with women and the third with men. That is why the studious man looks into more books and reads fewer than the studious woman. For information in itself, apart from any apparent use, man has little liking. He may not be more practical, but he is more objective than a woman.

Consequently a reference library rather than a reading library is best suited to masculine minds—a library primarily composed of books which nobody wants on his own shelves, but which anybody is liable to need some time. The free library is not for the purpose of furnishing a constant supply of Marie Corelli to lounging women and Wild West stories to idle boys. Belles-lettres, which form the main part of some public libraries, could be dispensed with if necessary. Editions of the standard authors, novelists, poets, essayists and historians can be bought so cheap that most people can and do supply themselves with such of them as they read without recourse to the public library, which, therefore, should give its first attention to acquiring a store of such information, both scholarly and practical, as is most needed by the people of its locality.

It is natural that the librarian should be most influenced by those who make most demands upon him and should fail to realize the extent and importance of the field he does not cover. His failure to satisfy a dozen calls for Howells's latest novel from as many active and influential women is likely to impress him more than the unusual request of a carpenter for a book on stair building. He would be ashamed not to know the name of Howells's latest, but he did not know there were books on stair building. The large predominance of women in library work and management has tended to increase the feminization of the public libraries. A woman can no more select books for a man than she can cigars or neckties. Women are as a rule good librarians; they are excellent catalogers, they keep things neat and maintain order, and they take a personal interest in suiting the book to the reader; but they are somewhat out of touch with the life and work of the community in which they live.

Where a man is chosen as librarian in a

small town he is not likely to be much better than a woman in this respect, because his acceptance of such a low salaried position indicates that he loves books more than their purposes.

If a plumber, fresh from his interrupted job, runs into one of our Carnegies, sets his soldering furnace on the tessellated pavement, and, resting his grimy hands on the onyx paneled counter, asks, "How can I solder an aluminum ring on a brass tube?" the lady-like attendant is apt to give him a glance of reproof for disturbing the holy calm with the earnest voice of a man who really wants something, and then, in her level tone, she tells him to "Consult the card index on the right." If, however, she is unusually kind-hearted and well-informed she hunts up and dusts off the first volume of Ure's Dictionary of the Arts and hands it to him with great confidence, regardless of the fact that it was published 20 years before aluminum came into use. If you want a report on the cotton crop, or brick making, or cooking of meat, or the infra-red spectrum, or Indian blankets, or any other public document, you will save time by writing directly to Washington for it. Of course, a copy is in the town library a few blocks away, but the librarian does not know it. Probably it is in one of those blue and gray striped bags that crowd the basement room.

At present the town library is to be classed rather with municipal amusements, like the band playing in the park on summer evenings and the fireworks on the Fourth, than with public utilities. It is chiefly used to supply a kind of wholesome, elevating intellectual recreation and divertisement, a perfectly legitimate function, but it could also be made a public servant for all the people in their daily work. When the farmer drops in to see what is the red bug that is eating his box elder trees and what to do for it, or, rather, against it; when the editor telephones over for a map of Port Arthur for the afternoon edition; when the orator for "Pioneer Day" finds there anecdotes of the early history of the town; when the boy who wants to study electrical engineering in his odd hours does not have to send \$25 to a correspondence school

for books the library ought to supply; when the village inventor can learn how many times before his non-refillable bottle has been patented; when the grocer's clerk comes over to see what brands of baking powder contain alum; when the mechanic can find out what horse-power he can get from a windmill above his shop; when the political junta adjourns from the drug store to the library to see how much McKinley ran ahead of his ticket in 1896 in the Fifth Congressional District; when the young married couple look over the colored plates of a volume on the house furnishings à *l'art nouveau*; when the labor leader comes in to look up English laws on the financial responsibility of trades unions; when the Mayor sends in for all the books on the municipal ownership of electric light plants; when the Clerk of the District Court discovers in the files of the local paper an advertisement of a dissolution of partnership ten years ago—then we can be sure that Andrew Carnegie has not wasted his money.

## The Commencements

LORD CROMER once asked a lady at Cairo what she thought of the Pyramids. She replied that she never saw anything half so silly in all her life; "and," said Lord Cromer, "I am rather inclined to agree in this scathing but original criticism." That is one way, the practical way, of looking on the Pyramids; very different, but quite as suitable, were the words of Napoleon to his troops on the 3d Thermidor of the year Six, "From yonder Pyramids forty centuries look down upon you."

Mr. J. W. Mackail has made these two utterances as to the Pyramids an illustration of the contrasting attitudes toward the study of what are called the Humanities. It is at Commencement time that the conflict of view is most emphasized. Now our universities send out from their halls two troops of young men and women; one troop devoted to practical studies, and the other to the general Humanities, including Latin and Greek as chief implements of culture. One class of men cry that they never saw anything half so silly in all their

lives as the study of the dead languages; while from the same height the other look down over forty centuries of human growth and culture.

We have now sufficiently settled the conflict between the two schools of education. We allow both to develop side by side. The field of learning has become so large that it is impossible to ask the average youth to cover it all; he must choose—we say, “elect”—one line or the other. He must follow a “major,” for he is in a hurry to get to work and make his living. Education is now very much a preparation for bread-winning; and what does not the soonest win bread has to be slighted. Fortunate is that youth, of large nature, who is able to give time to self-culture with a view to something else than hasty self-support.

But what are the Humanities? The term is much enlarged. It now includes much besides classical learning. It embraces whatever does not go to bread-and-butter studies. It excludes the natural sciences, but it includes all history, philosophy, sociology and political economy. One might ask now whether even some of the comparatively useless but agreeable natural sciences, like astronomy and botany, should not be classed as humanistic. Whatever goes for general culture and knowledge, rather than for profit, may well count in the company with Latin and Greek.

Perhaps the most nearly useless of all studies is astronomy. It would be hard to count one bit of practical use in the immense stacks of photographic plates of the heavens at Harvard University, out of which Professor Pickering is classifying the variable stars, with their various spectra. But it is all delightful, as it gives us new views of the constitution of the universe. There is more profit, however, in the dead languages. But why are they “dead”? Give us live teachers, and Latin and Greek will be alive. It is literature and history that we need to learn from them, not the mere mechanism of speech. Much modern teaching of the classics is as absurd as it would be to devote elaborate study to the construction of an old locomotive, and never set it at work to carry freight and passengers.

**Norway** Disruption is not in the regular line of progress. We did not believe in it in 1861, and we are all now glad we did not. We should regret to see the Austrian Empire divided, unless it was to create larger unions. The separation of Norway from Sweden seems unfortunate, and it is not easy for outsiders to see any sufficient good reason for it. Norway and Sweden have a dangerous neighbor to the east of them, and they ought to be able to stand close together, without rivalry. To be sure, Norway may choose to be a republic, which is in itself a good thing, altho, as kings go, a more harmless king than the excellent Oscar of Sweden can be expected nowhere. But such a nominal monarchy as that in Scandinavia differs very little from a republic. The division makes neither for economy nor for protection, and will satisfy chiefly the sentiments of a very sentimental people, who have felt that their interests have been subordinated to those of Sweden. The Norwegian Storting demanded a separate consular system; but that was equivalent to demanding secession; and secession naturally followed the refusal, and was what was really desired. It is now to be hoped that Sweden, Norway and Denmark will form a close alliance for common defense against two powerful and covetous neighbors. Such smaller nations as these, and as Holland and Belgium, need carefully to protect themselves if they will not lose their autonomy.

#### A Tribute to President Roosevelt

Baron d'Estournelles, the French leader of the Parliamentary group at work for peace, praises President Roosevelt for his intervention, and regrets that it could not have been taken by France. He says:

“President Roosevelt has already given four such striking lessons to Europe—first, in having brought before the Arbitration Tribunal at The Hague the question between Mexico and the United States over the Pious Fund claims, while Europe was scoffing at the peace court which it had created; second, in obliging Europe to settle pacifically the Venezuelan affair; third, in proposing a second Peace Conference at The Hague to complete the work of the

first, and, fourth, in now intervening to put to an end the hecatombs in the Far East.

"The conclusion of this is plain. All that the European Governments have morally lost through their timidity the Government of the United States has gained. It is another good example for Europe of America's energy in safeguarding the most sacred rights of humanity."

This is wisely said and is just. But it might be added further, that the Arbitration Tribunal itself is due to the insistence of the United States representatives that it be created, when the Continental nations were indifferent or hostile, not believing that it could amount to anything.

#### A New Law of Nations

It surprised every one that the United States refused to allow the Russian cruisers at Manila time to repair their injuries. Instead of allowing the usual period for repairs our Government decided that the Russian vessels must leave in twenty-four hours or be interned. They were not in condition to leave; and therefore essential parts of their machinery and armament were removed, and the vessels are held until the end of the war. Really this is to the advantage of Russia as much as of Japan; for if they had made repairs and attempted to leave port they would certainly have been captured or sunk. And equally the decision is of advantage to Japan, as she will not be compelled to keep a fleet off Manila to catch them when they leave; and she will have a fair chance to hold them under the terms of peace. The rule is a new one, and seems to be a just one, that injuries received in battle are to be treated differently from those coming from storm or accident. If a ship of war injured in battle can run to the nearest port and there repair to renew the battle a grave wrong and injury are done to the other belligerent nation. While there will be criticism of the rule, we believe it will be accepted at the coming conference of nations. Every rule is good that limits the scope of the evils of war, and great credit is due to our Administration for creating the new rule and precedent.

#### 32 Out of 45

The most coveted honor that an undergraduate can hope to attain at Yale University is an election to one of the three Senior societies. Last week each one of these three societies "tapped" 15 members from the Junior class. As Yale is unquestionably the greatest athletic university of the United States, we have been curious to read the biographies of these 45 men as published in the *Alumni Weekly*. It turns out that 32 out of the 45 are distinguished for their connection with athletics. This is a commentary on modern college ideals to make the judicious grieve, for the rating of athletic ability above other manly attributes can be found, we venture to assert, nowhere else in civilization except in American universities. Of course, Yale is merely the most prominent institution engaged in the practice of athlete worship; we do not mean to single her out above the other colleges who are in proportionate degree culpable. In this connection we call attention to a striking article in the current number of *McClure's Magazine*, which shows with a deadly detail of dates, names and specifications how the commercial spirit has insidiously undermined the athletic conscience of Yale, Harvard, Princeton, Pennsylvania and the lesser colleges. Equally striking is the fact that a dozen undergraduates, with whom we have conversed, admit the article is true enough, but do not see where the wrong comes in. Until our college faculties get into close personal touch with the students, as they do at Oxford and Cambridge, and as President Wilson, of Princeton, hopes to do with his "preceptorial" system, we have little faith that our athletic standards will equal those of the English universities. Our college boys are left too much alone to work out their own affairs.

**The "Saturnalia"** The action of the trustees of the Metropolitan Museum in refusing to put Biondi's group, the "Saturnalia," on exhibition was so far approved by Justice Leventritt, of the New York Su-

preme Court, last week, that no damages were allowed to the artist. It is an important decision, and one we rejoice in. The group was not condemned for nudity, but for indecency; and there is a difference between the two. A picture of Adam and Eve being driven out of the Garden is nude, but perfectly decent. On the other hand, a picture of the elders peering through the trees to see Susanna at her bath is suggestively indecent. The pruriency is in the purpose of the picture. So in this group the drunken orgies of paganism were represented, realistically, as orgies, and to an ordinary man the design is lewdly suggestive. There are certain pictures and statues—and it is easy to recognize the type—which are fit only for a saloon or a gilded brothel. It is not fitting to put them on public exhibition. Very different is the sentiment in Hogarth's "Rake's Progress," or Michel Angelo's "Last Judgment," and any intelligent person can make the distinction in the moral purpose and the ideas suggested to the beholder.

#### Resident Physicians for Hospitals

We lately spoke of Dr. Osler's appeal for American hospitals which should be supplied with a sufficient force of experienced resident physicians, instead of depending chiefly on visiting physicians and unpaid young graduates who are learning their business and will leave after a year or two of experience. As an illustration of what is the evil to be corrected our attention has been called to a certain hospital for consumptives in this city, where three or more patients are received every day, and where there is no resident physician, but a visiting physician comes in at four in the afternoon. In place of the cheery and hopeful face of a resident physician the patient reads in the entrance hall on the right hand side as he comes in, inclosed in a frame, the warning words: "Eternity! Eternity! Eternity! Prepare for eternity!" The warning may be good and well meant, but somehow it seems misplaced. A wise woman once remarked that the consciousness of being well dressed would give a peace of mind which religion could not bestow.

Equally religion is no substitute for a doctor.

#### History Made to Order

Mr. J. De Witt Miller, of Forest Glen, Md., recently obtained from a New York bookseller the late Mr. Charles O'Connor's copy of "Prison Life of Jefferson Davis," by Brevet Lieut.-Col. John J. Craven, M. D., published in 1866. Loosely laid in the volume, he tells us, was the subjoined letter to Mr. O'Connor, a letter interesting as showing one of the presumptive sources of the material of a book supposed to give Mr. Davis's opinions only, as reported by Dr. Craven, and it is valuable as setting forth one of the ways by which the friends of Mr. Davis in the North sought to influence public feeling in his favor. It reads:

CITY OF NEW YORK, LAW DEPARTMENT, OFFICE  
OF COUNSEL TO THE CORPORATION.

April 23d, 1866.

MY DEAR SIR: A book is being got up containing a true and exact narrative of certain conversations held between Jeff Davis and his physician while they were together in Fortress Monroe.

The physician, I am told, has a defective memory, and it needs jogging. He is willing that it should be jogged by any one friendly to Davis. Do you remember anything that Mr. Davis said or would be likely to have said about his own condition, or that of this Republic? If so, I am pretty sure the physician will remember it, too. The narrative is in diary form, and as until July, 1865, Mr. Davis had no access to newspapers, up to that time his thoughts were wholly concerned in the past. Since then he has talked of things present and future, and in his conversations will be found his defense as far as it goes.

I have been applied to about the narrative, but as I never knew Mr. Davis or saw him, I can do nothing.

You remember the diary of Barry O'Meara, who attended Napoleon and saved the Emperor's reputation. Davis has not had the luck to die, but something may be done to save his friend.

Will you think of this some time.

The work progresses fast.

Yours truly,

RICH'D O'GORMAN.

Really, this is interesting.

#### Paper Saints and Paper Gods

A correspondent who signs no name, but who we suspect is a Catholic priest (for he reads Latin in the

Catholic *Ecclesiastical Review*), asks our attention to the decision of a grave question by the Sacred Congregation of the Inquisition at Rome. The question put to it was this:

"May it be held allowable to swallow little paper images of the Blessed Mary, soaked in water or rolled up in a pill, for recovery of health?"

One would have thought it a capital chance to give some elementary instruction to ignorant people; but the answer is in these brief words:

"Provided any vain observance, or danger thereof, is avoided, it is allowed."

Somehow it reminds us of the use of a paper kitchen god among the Chinese. It must be kept in the kitchen, where it will hear of every evil word and deed and report them above at the end of the year, when it is to be burned to facilitate its upward journey. But before burning it is the custom to put on its mouth a peculiarly tenacious gum which will hold the teeth together so that the god may not be able to make his report.

#### Closer Connectionalism

While to us *nihil humanum alienum est*, we are hardly called upon to go into any prolonged discussion of the proposed reorganization of the Congregational Home Missionary Society, beyond noticing the gradual strengthening of the connectionalism of the denomination. Present movements would quite have shocked Dr. Leonard Bacon, who protested at Oberlin against the constitution of the National Council. The Congregational benevolent societies, which were founded, except the American Board, with a vote to anybody who would contribute, have been changing their constitutions to a representative system; and the Home Missionary Society, at its meeting in Springfield, went to the extreme of approving a plan, to be finally adopted next year, by which the State Home missionary societies shall elect a Board of Directors of the National Society, and these elect the

Executive Committee. There is to be one secretary, with assistant secretaries; and the State Societies are to provide the funds for the National Society. It makes a finely articulated organization from which much is to be hoped. Some questions are to be considered before final adoption. The most important is not as to the federated system, but whether it will provide as much money, with its one collection, as does the old way, which takes up one collection for the State Society and another for the National Society. The Congregationalists seem, this last year, to have dropped from their rank at the head of American denominations for their relative contributions for benevolence, the Presbyterians being now ahead of them. Another feature of the new plan which will need consideration is that which makes the members of the Executive Committee ineligible after six years, a rather brief period, while it makes the secretary chairman. As it is desired to get a man of great ability for secretary, a better plan could hardly have been devised to give him the control of the Executive Committee. But perhaps the one-man power may work best, for Mr. Spurgeon used to say that the best committee is a committee of five of which four are sick or absent. We do not object to the criticism that the plan "Presbyterianizes" the denomination. We prefer to think that it will bring it into closer sympathy with the coming union with the United Brethren and Methodist Protestants.

In the negotiations for peace we see another advantage of The Hague Treaty. President Roosevelt could go to the Czar, who called The Hague Conference, and remind him that under that treaty it should not be regarded as an unfriendly act if another Power seeks to mediate between two nations at war. Thus Russia and Japan were precluded from taking offense. That Hague Conference was a blessing to the world, and we want more of the sort.

# Financial

## Four Dollars Per Square Inch

THE sale of a small lot at the south-east corner of Broadway and Wall Street last week for \$700,000 shows the great value of real estate in that part of New York and also how rapidly the value has increased in recent years. There are only 1,195 square feet in the lot, which is 30 feet by 39 feet and 10 inches. Standing upon it is an old-fashioned four-story brick building that was erected in 1830 at a cost of \$8,700. Annual taxes now exceed that sum, and the lessee has been paying them, together with \$25,000 a year. It will be observed that the sale price was nearly \$600 a square foot and a little more than \$4 a square inch. The highest price heretofore paid in this neighborhood was \$348 a square foot, for the site of the present offices of J. Pierpont Morgan & Co., in 1872. The little corner lot at Broadway and Wall was first sold about 200 years ago for £103. In three succeeding sales the price rose until it was £1,000 in 1780. There had been no sale since 1827, when the property came into the hands of an uncle of the late Benjamin D. Silliman for \$18,275. To Mr. Silliman it descended by inheritance. After holding it for 30 years he died in 1901, and it has now been purchased from his estate. Seven years ago he was upon the point of selling it for \$460,000, but at the last moment the buyer changed his mind.

## Our Trade with Japan

AN official report issued last week shows that Japan has made rapid progress in her foreign commerce during the last decade, and especially in trade with the United States. Her imports have increased from \$25,000,000 in 1884 to \$58,000,000 in 1894 and \$184,938,000 in 1904. Figures for her exports are given for no earlier year than 1895, when their value was \$69,825,000. Since that year, however, they have risen to \$101,000,000 in 1900, and to \$158,992,000 in 1904. Of Japan's purchases last year, Great Britain supplied 20 per cent., British India 19 per cent., the United States 15½ per cent., and China nearly 15 per cent. Turning to her exports, we find that the

United States is her best customer, taking last year 31½ per cent. (\$50,423,000) of her shipments. The shares of several other countries were as follows: China, 21 per cent.; Great Britain and Hong Kong, 14¼; France, 11. While our purchases of Japanese goods have grown from \$11,000,000 to \$50,000,000 in twenty years, our sales to Japan have increased in the same period from only \$2,000,000 to very nearly \$29,000,000. The bulk of these sales consists of kerosene oil, raw cotton, cotton goods, flour, machinery and other manufactures of iron and steel. More than two-thirds of her exports to us are raw silk and silk goods (\$36,500,000) and we bought from her last year \$9,000,000 worth of tea, matting, porcelain and camphor.

✽

TRAINS on the Alton road between Chicago and St. Louis are to be equipped with wireless telegraph apparatus, recent experiments having shown that messages can easily be transmitted to trains moving at the rate of 50 miles an hour.

....Uberto C. Crosby recently resigned as president of the New Hampshire Fire Insurance Company of Manchester, N. H., and has become manager for the United States of the Royal Exchange Assurance of London. Before entering the service of the New Hampshire Fire Insurance Company Mr. Crosby was secretary of the Bay State Fire Insurance Company of Worcester, the New England agent for the Commercial Union Assurance Company of London and special agent for New England and a portion of Canada for the Phoenix Fire of Brooklyn. The Royal Exchange Assurance was incorporated in 1720. The statement of the condition of the United States branch of the Royal Exchange Assurance shows assets of \$2,362,422, liabilities of \$1,569,109 and surplus to policyholders of \$793,313.

....Dividends announced:

Interborough R. T. Co. (Manhattan), quarterly, 1¾ per cent., payable July 1st.

Van Norden Trust Co., quarterly, 2½ per cent., payable June 30th.

Missouri Pacific Rwy., \$2.50 per share, payable July 20th.

Plaza Bank, 10 per cent., payable July 1st.

Yorkville Bank, 5 per cent., payable July 1st.

No. 2951

## Survey of the World

### National Topics

An authoritative announcement of the withdrawal of ex-Attorney-General Harmon and Frederick N. Judson from the case relating to the payment of rebates by the Atchison Railroad Company was made last week. They were appointed in February to investigate, "with the view of taking such legal proceedings as seem justified." Two months ago they decided that the Government ought to prosecute. On the 14th Mr. Harmon said:

"Mr. Judson and myself made the investigation and recommended that a certain proceeding be taken. The Attorney-General disapproved our recommendations, as he had a perfect right to do. The nature and circumstances of our appointment seemed to impose a degree of important responsibility, and we thought our duty required us to adhere to our views. We have so notified the Attorney-General and retired from further connection with the matter."

It is understood that they recommended the prosecution of the Atchison officers, including Mr. Paul Morton, who was in control of freight traffic on the road when the rebates were given; also, that the prosecution of these officers was opposed by Attorney-General Moody. An official statement of the whole matter will be given to the public.—A report was widely published last week that Chief Justice Fuller was about to retire and that Secretary Taft would at once be appointed in his place. It appears to have had no foundation in fact. The Chief Justice intends to retain his office so long as his health shall permit him to do so. Mr. Taft was annoyed by the report, which he declined to discuss. His promi-

nence among those mentioned for the Presidential nomination continues to be considered by the press.—After a recent conference at Cleveland with Mayor Johnson and others concerning street railways, Mayor Dunne, of Chicago, predicted that the Democratic platform in 1908 would call for Government ownership of the steam railways.—A platform written by Mr. Bryan for the Democrats of one of the Nebraska Congressional Districts commends Mr. Roosevelt for his order concerning the purchase of Panama Canal supplies and congratulates him upon "the adoption of the Democratic plan for doing away with railroad discrimination and rebates."—Ben Daniels, formerly a Rough Rider, has been appointed Marshal of Arizona. He was nominated for this office in 1902 and the nomination was confirmed, but upon the discovery that he had served a term of three years in the Wyoming penitentiary the confirmation was reconsidered and the nomination withdrawn.—Owing to commercial and industrial depression in the Danish West Indies efforts will again be made by the people to obtain the consent of Denmark for a sale of the islands to our Government.

### Uncovering the Work of Philadelphia's Ring

Mayor Weaver and the aroused people of Philadelphia are now uncovering the rascality of the ring in their city and preparing to bring the thieves to punishment. The arrest of Select Councilman Frank H. Caven for being unlawfully interested in contracts for material to be used in the new filtration beds (now under construction at a cost of \$27,000,000) has

been followed by disclosures showing how Boss Durham and his associates acquired their millions. Contracts for about \$50,000,000 (including \$17,000,000 for filtration works) have been given to the firm of Daniel J. McNichol & Co. The nominal head of this firm was forced to admit at a hearing in the Caven case that his interest was only one-twelfth and that the remainder was held by Boss Durham (State Superintendent of Insurance) and State Senator James P. McNichol, Durham's right-hand man. When Senator McNichol was a member of the Councils, his interest stood in his wife's name. Until recently, another partner was John M. Mack (formerly a bartender, named McNamara), who is now the head of the Asphalt Trust; but there was a quarrel, and Mack appears to have turned against his old associates, who so hated him that they diverted the course of the new Torresdale Boulevard, turning it aside at almost a right angle, to avoid the land which he had bought when they made similar investments before the plans were known to the public. For these filtration contracts and others under the head of public works, the highest bids (those of the ring) were accepted, and the work was then sublet to the lowest bidders, the ring taking the difference, which amounted to about 30 per cent. All of the McNichol contracts will be thoroughly investigated. By order of the Mayor, work upon the filtration beds and the Torresdale Boulevard has been suspended. John W. Hill, chief engineer of the Filtration Bureau at a salary of \$17,000, has resigned, and his office and records are guarded by detectives. A few years ago the appropriation for these filtration beds, which were needed for the purification of a water supply that was causing a continuous epidemic of typhoid fever, was withheld for a long time by Boss Durham for the reason, as then alleged, that plans for ring control of the money had not been completed. It now appears that contracts for nearly all the work upon the filtration system have been held by the Durham-McNichol firm, altho Durham's interest was concealed. The Torresdale bed is designed to supply 1,000,000 people. Caven was interested in subcontracts and was not a

prominent figure in the ring's work. It is expected that persons of much greater influence will soon be arrested. The newspapers say to Governor Pennypacker that he must remove Durham from his State office and thus show that he is not "standing with the grafters and thieves." They also remind him that the "ripper" bills which he approved, upon the advice of Durham, were designed to facilitate the robberies of the treasury which are now being laid bare. Mayor Weaver has returned a pair of fine horses, a brougham, a pony and a cart given to him by Durham on Christmas last.

#### Other Measures of Reform

Before these disclosures were made, Mayor Weaver had won another victory in the Councils. When they approved the gas lease they also passed, over his veto, ordinances giving the street railway companies perpetual franchises for 110 miles of streets, without requiring compensation. When they were asked to repeal these ordinances their committee hesitated, and at a meeting where hundreds of citizens yelled "thieves! thieves!" it voted, 15 to 11, to ask the City Solicitor whether such action could lawfully be taken. When he replied that it could be, the committee reported unanimously for repeal, and the Councils will approve the report. The Mayor has removed 79 employees who were doing almost nothing, and has thus saved \$41,000. This is only a beginning. One of these employees was William O. Ratcliffe. Since 1871 he had been tried and convicted five times—three times for burglary, once for larceny and once for conspiracy. This man was employed as a watchman to guard the city treasury! The interest of the State Government in the work is shown by the recent appointment of Arthur R. H. Morrow to a good place at Harrisburg by the State Treasurer, after his removal by Mayor Weaver from a prominent office in the city's Department of Supplies. The history of the ballot box frauds in 1899 is recalled by the resignation of Samuel Salter, for whom the Councils created an office after his trial and acquittal. Salter and six others, some of them living in Washington, were arrested upon the charge that

they had deposited 215 fraudulent ballots in one box. One pleaded guilty and was imprisoned. The others got bail and disappeared. After a long time they returned, were tried and were acquitted, mainly upon testimony tending to establish an *alibi*. The witness (a woman) upon whom they relied has since had a place in the Mint. By direction of Mr. Roosevelt, Civil Service Commissioner Cooley is now making an inquiry in Philadelphia to ascertain whether Deputy Internal Revenue Collector Meeser (who was a defendant with Salter) is morally fit to hold a Federal office, and also whether the witness above mentioned ought to retain her place. Ex-Mayor Ashbridge, before sailing for Europe last week, said to the press that he thought Mayor Weaver was guided by his conscience. "So long as a man has his conscience and his God as guides," he continued, "he should not be criticised." He also deplored the lack of honesty in politics. It was Mayor Ashbridge who signed at midnight, against public protest, a bunch of railway franchises originating at Harrisburg and approved by the Councils, altho they were granted to local politicians without compensation and Mr. Wanamaker had offered to bid \$2,500,000 for them.

**Harsh Treatment of Chinese Travelers** The proposed boycott of American goods by the commercial guilds of China has led our manufacturers of cotton cloth to ask for a more liberal administration of the Chinese Exclusion law, with respect to the treatment of Chinese in the exempt classes. Our exports of cotton goods to China have been increasing, and for the current fiscal year they exceed \$27,000,000. A memorial on this subject was presented to the President last week by the American Asiatic Association and by delegates representing the cotton mill industry. Attention had very recently been directed to the harsh treatment of Chinese travelers by the experience of four Chinese students who arrived at Boston from England, having no certificates, but bearing letters of introduction from Ambassador Choate. The President has written to Secretary Metcalf, directing that immigration inspectors shall

use more care in such cases and avoid unnecessary harshness. In an address at the commencement exercises of Miami University, on the 15th, Secretary Taft took up this question, saying:

"Is it just that for the purpose of excluding or preventing perhaps one hundred Chinese coolies from slipping into this country against the law we should subject an equal number of Chinese merchants and students of high character to an examination of such an inquisitorial, humiliating, insulting and physically uncomfortable character as to discourage altogether the coming of merchants and students?"

"One of the great commercial prizes of the world is the trade with the four hundred million Chinese. Ought we to throw away the advantage which we have by reason of Chinese natural friendship for us and continue to enforce an unjustly severe law, and thus create in the Chinese mind a disposition to boycott American trade and to drive our merchants from Chinese shores, simply because we are afraid that we may some time lose the approval of certain unreasonable and extreme popular leaders of California and other Coast States? Does the question not answer itself? Is it not the duty of members of Congress and of the Executive to disregard the unreasonable demands of a portion of the community deeply prejudiced upon this subject in the Far West, and insist on extending justice and courtesy to a people from whom we are deriving and are likely to derive such immense benefit in the way of international trade? We must continue to keep out the coolies—the laborers; but we should give the freest possible entry to merchants, travelers and students, and treat them with all courtesy and consideration."

#### **Corruption in the Arkansas Legislature**

Six members of the Arkansas Legislature, including the president of the Senate (A. W. Covington), have been indicted for receiving or offering bribes, for perjury and for conspiracy at the recent session. The accused men are Senators Covington, Gross, Rison and Toney, and Representatives Chapline and Andrews. Others will be indicted. Corruption like that which engaged the attention of Prosecutor Folk at the Missouri capital has been brought to light in the Legislature at Little Rock, and the investigation was made by Prosecuting Attorney Lewis Rhoton, the elevation of whom to the office of Governor is already suggested. It is alleged that

at the recent session \$100,000 was corruptly used in the Senate, and nearly as much in the House, in connection with about a dozen measures, one of which was a Pure Food bill, like the one which was the subject of corrupt negotiations in the Missouri Legislature. The other bills related to appropriations for levees and for the completion of the State Capitol, to telephone companies and to the establishment of a new county seat at a town recently founded by a wealthy family. Evidence was procured by expert detectives, some of whom had worked for Prosecutor (now Governor) Folk in Missouri. The accused men, the prosecutor and the members of the grand jury are Democrats. There were only five Republicans in the Legislature.

#### Labor Questions in Chicago

The end of the teamsters' strike in Chicago appears to be near at hand. For some time the places of nearly all the strikers have been filled. But little violence was reported last week until Saturday, when two men were killed in riots and two severely wounded. The number of persons killed since the beginning of the controversy is 18. Statements concerning the alleged settlement of strikes by bribery now excite much interest, owing to testimony before the grand jury. Several employers having testified as to payments made through the agency of John C. Driscoll to end or to avert labor disputes in the past, Driscoll himself told his story to the jury and gave the press a part of it. The State's Attorney asserts that sensational proceedings will follow, that both sides are involved, and that the evidence "covers every crime in the calendar." Driscoll says he was a "labor commissioner." He had been secretary of the Coal Team Owners' Association and also secretary of the Building Trades Council. He asserts that in the last five years he has used about \$50,000 of employers' money in settling or attempting to settle nearly 400 strikes. His own salary was \$2,200 a month. He gives names and dates and says he has shown the grand jury checks and check stubs and other documentary evidence in support of his story. Among his duties, he says, was the employment of "wrecking crews"

against union pickets, with the consent of union leaders, after these leaders had received money but had been unable to call off the strike. These "wrecking crews" broke the strike by "putting the pickets out of business." "I believe the work of a 'labor commissioner,'" he says, "to be perfectly legitimate in consideration of the rotten condition of the labor market in Chicago." The grand jury is also taking testimony concerning a story that the present strike was promoted and paid for by business rivals of Montgomery Ward & Co.—A general strike of foundry employees in New York, the first in ten years, has tied up all the foundries of the New York and New Jersey Foundrymen's Association, and thus thrown many molders and machinists out of work. A wage increase of 25 per cent. and the exclusion of non-union workmen were demanded.

**Cuba** The convention of the Moderate party (whose candidate is President Palma) adjourned without making a nomination, owing to the illness of Gen. Maximo Gomez, the old revolutionist commander-in-chief, whose death took place on Saturday last, two days after Congress by unanimous vote had appropriated \$100,000 for his benefit.—Debates in Congress indicate the passage of the pending bill increasing the duty on rice by about 125 per cent. This change is designed both to stimulate domestic production and to enable the rice-growers of Louisiana (aided by the reciprocity agreement) to underbid those of all other foreign countries in supplying the present demand.—Official reports show a great increase of trade with the United States. In the ten months ending with April our exports to Cuba were larger by 43 per cent. than in the corresponding months of the preceding year (increasing from \$21,855,000 to \$31,319,000), and our imports from the island rose to \$69,441,000 (from \$56,723,000), or nearly 22½ per cent. In the corresponding ten months of the last year of Spanish control (ending with April, 1898) our exports were only \$9,560,000, and our imports less than \$14,000,000. Since that year the value of our trade with the island has been multiplied by four.

**Railways for  
the Philippines**

Bids for the construction of 1,233 miles of railroad in the islands have been invited by the War Department under the authority of the new law which permits the Philippine Government to guarantee interest at 4 per cent. for 30 years on first mortgage bonds covering nearly the entire cost. The roads will be exempt from taxation, but must pay the Government  $\frac{1}{2}$  of 1 per cent. of the gross earnings during the first 30 years, and  $1\frac{1}{2}$  per cent. during 50 years thereafter. The bidders must be citizens or corporations of the United States or the Philippines. Routes have been planned by the Department, and in Luzon there are 833 miles of them. In the northern part of the island these are: from Dagupan to Laoag; from San Fabian to Baguio; from Dagupan to Aparri, and from Manila northward to connect with each of these lines. There is also a line southward from Manila to Batangas, with branches to Santa Cruz and Lucena. The project includes 100 miles of road further south, with terminals at Batan and Legaspi. Proposals are also invited for 100 miles on the island of Panay, northward from Iloilo; for a coast line of 100 miles in Negros, and for nearly 100 miles in Cebu. Leyte is to have 55 miles, from Tacloban to Carigara and Abuyog, and 50 miles have been allotted to the island of Samar. The right to operate telegraph lines along the routes is reserved by the Government. It is believed by those familiar with the islands that the construction of these projected roads, establishing communication between seaports and rich districts in the interior, will exercise a most important beneficial influence upon the islands, in which there is now only one railway, a short line from Manila northward to Dagupan.

**Peace Conference  
at Washington**

It is decided that the commissioners to arrange terms of peace between Russia and Japan shall meet in Washington and probably about the middle of August. Count Cassini, the Russian Ambassador to the United States, informed President Roosevelt that it was the desire of Russia that the meeting should take place in Paris. Minister Takahira objected to this on the ground

that France was an ally of Russia, and proposed Chefoo, China. Russia, however, was opposed to concluding peace on Asiatic soil, and preferred The Hague, which had been suggested by President Roosevelt. Both parties finally compromised upon Washington as a neutral and intermediate point of meeting. Two or three representatives will be chosen by each country. One of the Russian delegation will be Mr. Nelidoff, the Russian Ambassador to France, who was one of the negotiators of the treaty of San Stefano which ended the Russo-Turkish war of 1877. On the part of Japan Marquis Ito, one of the best known of the "elder statesmen" who created the new Japan, will be appointed, unless his age prevents his undertaking the labor. Baron Komura, Minister of Foreign Affairs, and Marshal Yamagata, Chief of Staff, are also mentioned. In using the word "plenipotentiaries" to designate the peace commissioners the Russian Foreign Office is careful to define it as "clothed with full power within their instructions, which are to receive Japan's proposals and transmit them to Russia for examination." If their powers are as strictly limited as this would indicate very little good could result from the meeting, but it is generally believed that they will be permitted to discuss and arrange a treaty by submitting each step to the two Governments. There is at present no prospect of an armistice during the peace negotiations, altho it is not disclosed which party objects to a cessation of the fighting in the field. The Russian officers have telegraphed to St. Petersburg protesting against the conclusion of the war, yet it is generally held outside of Russia that if Field Marshal Oyama advances he can drive back or possibly surround the army under General Linievitch.

**Norway and  
Sweden**

King Oscar's reply to the President of the Norwegian Storting is a vigorous protest against the action of the Norwegian Council of State in refusing to countersign his veto of the bill for a separate consular service and against the revolutionary proceeding of the Storting in declaring that the union of the two kingdoms is dissolved and

that he had ceased to reign over Norway. The main points of his argument are the following:

"One of the fundamental principles of the constitution and a fact that is most important is that Norway shall be a constitutional monarchy. It is clearly incompatible therewith that the King should sink to the position of a mere tool in the hands of the State Council.

"If the members of the Council of State by refusing to countersign any of the royal decisions could prevent them from having force, the King of Norway would be excluded from participation in the State administration. Such a situation would be as degrading to the monarch as harmful to Norway. The position of the King as monarch of the united kingdom of Sweden and Norway makes it incumbent upon him not to prejudice as monarch of one kingdom questions affecting the other kingdom.

"The duty of the King on this point cannot be reconciled with the view that one kingdom, through the refusal of its Council of State to append a counter signature, can annul the royal judgment, wherein the King refuses to give a decision prejudicial to the other kingdom, and injurious to the union.

"The law on which I took the oath and which has regard for the welfare of the united kingdoms determined my decision on the consular question, but here I was met not only by the refusal of the Norwegian Council of State to countersign that decision, but by the resignation of its members. When I declined to accept the resignation of the Council it declared threateningly that any Norwegian who cooperated in carrying out my decision would at the same moment be without a fatherland. I was therefore placed in the position of either myself breaking the riksakt, which I swore to uphold, or of reconciling myself to stand without councilors.

"The Council, after attempting to violate the constitution and to render void a decision of the King of Norway, legally given, resigned office and the King of Norway was deprived of councilors. The Storthing approved this breach of the constitution, and by a revolutionary proceeding declared that the legitimate King of Norway had ceased to reign and that the union of the two kingdoms was dissolved.

"It remains for Sweden and for me as King of the union to decide whether the attack by Norway on the existing union shall lead to the legal dissolution of that union. Let the present generation and posterity judge between me and the Norwegian people."

A special session of the Riksdag, or Swedish Parliament, is called for June 20th to consider the crisis. In the

meantime the Swedish Government refuses to recognize the provisional Government of Norway and the Foreign Minister has notified the Scandinavian Consuls not to "enter into communication with the illegal Norwegian Government or obey its orders." All Norwegians will be removed from the diplomatic service. It is possible that the Riksdag may agree to the separation without a struggle and consent to permit Prince Carl, the third son of King Oscar, to become King of Norway, in accordance with the request of the Storthing for a prince of the House of Bernadotte as ruler. If this is not done a republican Government on the Swiss model is likely to be established. Björnstjerne Björnson, the veteran Norwegian author and patriot, ventures the prophecy that:

"When the two countries are completely independent their relations are likely to improve, and it is probable they will then begin to discuss the advisability of a defensive alliance to include eventually other nations, not Germany alone; for in the three northern countries we begin to look forward to a great Teutonic alliance, embracing also America, Great Britain, Holland, Belgium and Switzerland. However impossible this may appear, it rests with the smaller nations to prepare the public mind for such emancipation from war."

The Socialists and labor unions of Sweden have declared themselves in favor of a peaceable settlement with Norway, and have telegraphed their Norwegian brethren that they will never take up arms against them.

#### The Hungarian Government

After long and fruitless efforts to find a man who was willing to undertake the task of governing Hungary in the present crisis Emperor Francis Joseph has appointed General Baron Fejervary Hungarian Premier, and he has formed a Cabinet from the minority party. The Government of Count Stephen Tisza was discredited in the last popular election, but the demands of the Hungarian Nationalists were so extreme that the Emperor would not consent to place the Government in their hands. In an autograph letter to the new Premier the Emperor says that while he approves of the proposals of the majority for interior ad-

ministration, he can only accept their demands in regard to the army within certain limits. He considers that any concessions as to the use of Hungarian as a language of command would imperil the safety of the dual monarchy. It remains to be seen whether the Hungarian Parliament will accept a minority Ministry.

**The Greek Premier  
Assassinated**

Theodoros P. Delyannis, the Premier of Greece, was stabbed June 13th as he was entering his carriage at the entrance of the Parliament building. The assassin, Gherakaris, approached as he left the building and opened the carriage door with a bow. As the Premier thanked him Gherakaris plunged a dagger into his abdomen, inflicting a wound from which he soon after died. The assassin was at once seized and came near being lynched by the crowd, but was taken to prison by the police. He is a professional gambler, and the deed was done out of revenge for action of Premier Delyannis in securing the passage of a law closing the gambling houses and in enforcing it rigorously. He had served a term of 18 years' imprisonment for the murder of his wife. The murdered Minister was very popular in Greece and he was given a state funeral, at which the coffin was followed by the Deputies, the sailors from the warships bearing wreaths, and the King, the Princes and Ministers on foot. Delyannis became Premier in 1883 and again filled the office in 1890 and in 1895. In 1897 he was compelled to resign because he was considered responsible for the disastrous war with Turkey, but he was soon recalled to office. He remained a poor man and did not leave enough property to support his nieces.

**The Appeal of  
the Zemstvos**

The representatives of the zemstvos, or district assemblies, of the Russian Empire succeeded in meeting in Moscow, notwithstanding the prohibition of the Government and the ukase of the Czar forbidding them to interfere in national politics. Over 300 delegates were present, including the mayors of 25 of the largest cities.

The meetings were held in private houses; the public was excluded and the press formally requested not to publish the proceedings. The Governor-General of Moscow declined to interfere with the meeting on the ground that serious consequences would follow its forcible dispersal. The zemstvoists were practically unanimous in demanding the convocation of a zemky sobor, or national assembly, to decide the question of peace or war, but there was some difference of opinion as to whether it was advisable to make other demands. A delegation of ten was appointed to carry to the Czar the resolutions adopted. The petition is couched in bolder and more determined language than was ever before addressed to the Czar by his subjects, and the fact that the congress of the zemstvos did not adjourn *sine die*, but voted a recess until the Czar's answer should be received, gives it greater emphasis. The municipalities of Moscow and of St. Petersburg have declared their adhesion to the address, and have appointed representatives to accompany the delegates to the Czar. The delegation from the zemstvo conference headed by Prince Trubetskoy of Moscow applied for permission to present the address to the Czar, but the request was refused. The delegates, however, remained in St. Petersburg under police surveillance until June 19, when they were received by the Czar. The Czar has left the Winter Palace at Tsarkoe-Selo and has gone to his summer residence at Peterhof Castle. Unusual precautions were taken for his safety on the journey. Every house in the Peterhof district was visited by the police and the inhabitants examined. No persons were allowed to come into the quarter later, and no boats are permitted in front of the palace except the guard boats. General Trepoff, recently appointed Assistant Secretary of the Interior, with extensive and unusual powers, is organizing a powerful system of secret police throughout the empire even more efficient than the famous "Third Section." The Czar is giving him the fullest support and he is looked upon by the liberals as the dictator of the empire. From time to time rumors are allowed

to transpire about the program of reforms drawn up by the committee under Minister of the Interior Buliguin and said to have been approved by the Council at Tsarkoe-Selo and soon to be put into effect by the Czar. It is reported to remove the disabilities upon Jews and to abolish the censorship of the press. A representative assembly is to be called which may have legislative as well as advisory powers, but which will not be allowed to control the finances. The Polish, Finnish and German languages are to be recognized as official. For the Caucasus the following reforms are promised: Progressive emancipation of the natives; abolition of indirect taxation; a Government protectorate, calculated to obviate racial conflicts; abolition of corporal punishment; the grant of Government land to peasants on liberal terms; the institution of district banks to facilitate land purchase; abolition of the Holy Synod schools managed by popes; complete freedom of conscience for all Russian subjects without denominational distinctions, each denomination to be allowed to have its own ministry and to erect churches; the revision of the penal code and laws of the empire. The Russian liberals and zemstvoists have no confidence in the Buliguin Committee and have refused to serve on it.

**The Moroccan  
Difficulty :**

The disagreement between Germany and France about Morocco is not yet settled, but the danger of an armed conflict, which at one time seemed imminent, has apparently passed. Premier Rouvier became convinced that the strengthening of the German garrisons on the frontier was not a mere bluff of the Kaiser, and that the warlike spirit manifested in the German army was likely to lead to serious consequences. French troops were also being massed upon the frontier, but the German Emperor let it be known that any further preparations for war would be regarded by Germany as a menace to her safety, so Premier Rouvier decided that he had better adopt a conciliatory attitude, at least while Russia was in no condition to give assistance to her ally. Accordingly he dismissed M. Delcassé and assumed

himself the direction of Foreign Affairs, relinquishing the portfolio of Finance, which he had formerly held, to M. Merlose. He has had repeated conferences with Prince von Radolin, the German Ambassador at Paris, and has consented to an international conference on condition that the French and German Governments can agree upon the precise points to be considered. England has sent to the Sultan of Morocco an emphatic refusal to take part in such a conference, and she has given France such resolute support in this crisis as to lead to the suspicion that the Anglo-French *entente* is more nearly of the nature of an alliance than has been supposed. The threatening attitude of Germany may have been in part for the purpose of developing the extent and character of the agreement between the two nations most inimical to her. It is probable that strong pressure was brought by France to induce Russia to consider peace proposals at this time, when France is in need of support against her ancient enemy. It must also have become evident to the Czar that the Kaiser has not been entirely disinterested in urging on the war against Japan. These were probably the determining influences which led to the acceptance of President Roosevelt's invitation. The German Emperor is reported to have taken great delight in the commotion caused by his visit to Tangier in the "Hamburg" and to have said: "The whole world is in trouble when I travel." Austria-Hungary and Italy have accepted the invitation to the conference on Morocco, on condition that such a conference is considered advisable by the Powers; Spain has declined, on the ground that her rights are satisfactorily established by the recent treaty with France on that subject. Count von Tattenbach-Ashold, the head of the German Mission to Morocco, has apparently secured the full confidence of the Sultan, with whom he is in frequent consultation since the departure of the French Mission from the capital. He is reported to have secured for Germany some important commercial privileges, and docking facilities at Tangier for the Hamburg-American steamers.

# My First Success

BY EDWARD GRIEG

[The following article, by the greatest Norwegian composer, will be of interest to all music lovers as well as to the general reader. The article will be concluded in our next issue.—EDITOR.]

I HAVE been asked to give an account of my first success. The question seems to me to be such a complicated one, however, that I am almost tempted to say that my first success would be a safe passage through this ordeal. The subject may be treated from many points of view. What success is to be considered the first? Is there, in reality, any such thing as success? Is it not always true that when we attain something which for the instant appears of value the voice of melancholy reflection seems to say: It is nothing, nothing? It is true that our entrance into the world is a success, altho primarily for that great artist, nature. Whether it is also one for us is a question which is open to argument. And then the conception of the word success. How different it is for different men! What another deems success need not necessarily spell success for me—and conversely. What in general constitutes success—if there is such a thing—is the most interesting point of the question. Is it that which is designated by the masses as “making a fortune”—is that the true, the final success for the artist himself? Or is it a question of satisfying an individual whose opinion is valued? Is not the essential of success rather that which takes place in the artist’s workroom, where, as does Ibsen’s Bergmann, he opens with his hammer the way to things unknown? Is it not the spirit of work which causes him to strive to attain and fix the things which are passing through his mind; is it not the continual search, even tho it may result in but the smallest outcome, which brings the greatest joy to the artist? Or is it childhood with its longings, dreams and hopes, all so full of poetry, that produces by anticipation the noblest, most ideal joys of life, and hence the greatest internal feeling of success? The answers to these ques-

tions, be they what they may, cannot, however, aid me in my decision. For this reason I shall proceed in another way. I shall relate some of my youthful experiences, their joys and their sorrows. Then I may leave it to the reader to select from this mass of material that which, in his opinion, constitutes a success.

In searching my recollections to recall the memories of days long past, to find, if possible, something that might be construed as a success, I return instinctively to the days of childhood, when life with all its possibilities lay before me as one continuous success. To that period which teems with youths seeking light as tho in a labyrinth. Half-forgotten memories of childish days overwhelm me. Youthful dreams that were never realized and ideas which were to have been carried out reproach me as does “die Knäuel” in “Peer Gynt.” But I also recall the vague anticipations of success in which I dared not believe, but which have been fulfilled notwithstanding. Ideas, hopes and dreams crowd up before me and seem to whisper: “Here am I—and I—and I—!” All seek mention; all would have a part in what formed my early success. Not the visible, external ones, of which there were but few, but those which were invisible, internal and taught me to have faith in myself. And when I try to attribute success to the others, at the expense of these, I seem to hear distant reproachful wails: “Will you deny me—and me—and me? You surely cannot have the heart to do that.” What can I do? Leave out all, because they are too trivial to be considered? No; that is just what I must not do, cannot do, in fact. For all these small recognitions and feelings of joy have each done their part toward the development of my personality. It is true that they are no longer regarded as successes by my critics of to-day; at

that time, however, from my naïve standpoint, they were of the greatest importance. I shall then relate what I can recall of those early days. In these memories, others may also find with me, if not successes, at least material for them. I could easily go back to my very earliest days, for who has such a delicate appreciation of recognition as a child? It is just this delicacy of feeling that the minister attributes to the "old Adam." I would prefer to call it the impulse toward brightness and sweetness, instead of toward darkness and bitterness. To the extent to which this impulse is satisfied in the child depends the future existence of the artist, I could mention many small triumphs of these years, which had a determining influence upon my imagination—when, for example, as a small boy I obtained permission to attend a funeral, and an auction, and observed everything so that later I might describe my sensations. If I had been forbidden to follow these childish instincts, who knows but what my imagination might have been influenced, even in those early days, and turned into another direction, away from its true nature. What a feeling of satisfaction it arouses to recall these memories, back to the very beginning! And why shall I not recall them, even the earliest? Why shall I not recall, especially, the mysterious feeling of gratification with which I first raised my hand to the piano to try to discover something—not a melody. Far from it. No, a harmony only. First a third, then three notes, then four. And finally, with both hands. Oh, joy!—five notes, the chord of the ninth.

When I discovered that, my happiness was indescribable. That was a success! No later one has ever delighted me as this. I was about five years old at the time. A year later my mother began to give me regular lessons on the piano. I did not anticipate that disappointment awaited me here. It became clear only too soon, however, that I was reluctant to practice that which must be practiced. And my mother was strict, terribly strict, and even tho her heart certainly rejoiced as I sat there and tried to discover things for myself—for it revealed to her the artistic temperament—she never allowed me to observe it. On the contrary, it was

no joking matter to her when I dreamed away my time at the piano, time which should have been devoted to my task. And when I came to the finger exercises and scales and all the other technical torments which were the stones presented to my childish craving for bread she was able to control me, even tho not in the room. One day I remember hearing her voice from the kitchen, where she was preparing dinner: "Tut, Edvard, F sharp, F sharp, not F!" I was completely overwhelmed by her superiority. If I had followed her directions more industriously and implicitly I should have been much better for it in many ways. But my unpardonable propensity to dream had even then commenced to produce the same difficulties which have pursued me throughout my life. If in addition to her instruction I had not inherited my mother's energy I would never have succeeded at all in passing from dreams to deeds.

At the same time that I started my piano lessons I also began to go to school, and I must confess that I was just as lazy there as I was with the piano. The successes of that time, which I am going to present to you, are not fitted to place me in a very favorable light, but they are there and must be described. My first school was one intended for both boys and girls. How vividly one arithmetic lesson is recalled to my mind! We were all to solve the same example in multiplication, the one finishing first and showing himself to be the most excellent getting the highest mark. My ambition was immediately aroused. Ah, thought I, I have the idea; in order to finish as quickly as possible I'll leave out all the naughts, for they have no value. I was soon convinced that that was decidedly a success with a question mark; in other words, a complete fiasco. It taught me a lesson, however, for I learned from it to keep the naughts in. The fiasco, then, was ultimately the cause of an internal success. For this reason I shall continue boldly to relate more of my fiascos.

From my tenth year on my parents lived on the seigneurial estate "Landas," which is situated a few miles from Bergen. Every morning, with my older brother, I had to go to school through

the famous Bergenser-Landregen. It was during this walk that I planned—as I thought—a very clever trick. It was the rule of the school that no pupil who came late could enter the class before the end of the first hour. Every rainy day then—and that was pretty often—when I happened to be totally unprepared, I would arrange it so that I came not only a little late, but would remain outside in the street under a leader pipe, until I was soaked through and through. When I was finally allowed to enter the class, small streams of water would be running off my clothes to the floor, so that for my own sake as well as for that of my fellows, the teacher would send me home to change my clothes. Owing to the long distance this was practically an excuse from attending all the morning classes. That I succeeded often with this scheme may well be imagined; but, alas, once I carried it too far when I entered soaked to the skin, altho it had rained but little. This, of course, aroused suspicion and caused me to be watched, so that one fine day I was caught and became intimately acquainted with the “switch.” Again a fiasco! But my experience was the richer for it—in other words, another success—even tho negative—yes, almost a criminal success. For what is it but the criminal nature of man which is shown by the increasing foolhardiness which ends in the arms of the law? I may say here in excuse that my life in school was terribly unsympathetic, the materialism, the roughness, the coldness were all so contrary to my own nature that I tried with all my power to be released from it, if but for a short time. And to-day, in looking back, I see that the child was not so much to blame; at least as much should fall upon the school itself. At that time, indeed, school seemed to me to be utter misery, and I could not understand the necessity of thus tormenting children. I have not the slightest doubt that school developed in me everything that was bad and left the good untouched.

But to return to my fiascos. I recall that I was not very exact as to the names in history and geography, and that my teacher when he called upon me usually said: “Now, you nametwister.” And I cannot say I enjoyed the title. One

day when I had answered even worse than usual he wrote on my report: “You poor Edvard, how burdened you will be on your return to Landas, with your heavy raincoat, your pile of books and in addition a great big four (a very bad mark), and, notwithstanding this, must climb the steep hill to Landas!” He made it appear to me, so realistic were his words, as if I had indeed a whole world to carry. To be laughed at thus, before the whole class, was no enviable success. But then a negative success is always more unpleasant than the other kind. At another time in the German class I translated, much to the joy of the class, “der gemeine Hollunder” as “der gemeine Holländer.” And in the English lesson I once said that kalbsbraten (roast veal) was “beef of veal” in English. The teacher burst into laughter and cried: “Go home and tell your father” (he was English Consul) “that kalbsbraten is ‘beef of veal.’” I blushed with shame. That was a terrible setback and one which reduced my faith in my own capabilities, both at school and at home, where my stupidity was soon reported by some friendly soul. By good fortune, however, I soon obtained consolation in the same class. We had encountered the word “requiem” in the text, and the teacher asked if any one could give him the name of the celebrated composer who had written a piece of sacred music under this title. Nobody replied until in a low tone I answered: “Mozart.” The entire class stared at me as if I were a strange and mysterious being. That I considered a success. But I saw immediately that it boded ill for me, and I very soon found my fears to be well grounded. The class did not like—as is so often the case—to have such a being among them, and from then on followed me in the streets with the taunt: “See, here comes Mosak.” “Mosak” followed me even in the distance, after I had eluded my tormenters by slipping down a side street. I felt this as a terrible injustice and looked upon myself as a martyr. But little more was needed to cause me to hate my school-fellows, and it is certain that I withdrew myself as much as possible from most of them.

As is obvious, my school successes

were not as a rule of the flattering kind. There were exceptions, however, which brightened my existence like a ray of sunlight. In the singing class, for example, everything went smoothly. One day when we were being examined in the scales, not one of the thirty in the class knew much about them, but I knew all. Finally the teacher (a kindly old Czech, called Schediwy) said: "I will not give out any marks, but Grieg was the best." I was the lion of the day and enjoyed the situation.

And I must not forget to mention one success which I had in an examination. At that time we had a very intelligent teacher of history, who did not require us to learn the lesson verbatim, but allowed us to relate the events in our own words. It happened that for a time I was forced to remain away from school on account of trouble with my eyes. I never learned my lessons then and did not notice that any loss was apparent. My father thought otherwise, however, and later made me study from that point at which I had stopped at school. And that was not enough; he forced me to learn the history of Louis XIV completely, and then repeat it to him word for word as it was in the book. It was an unpleasant task, but I was in a trap and could not escape it. I may say that I obtained a very exact knowledge of Louis XIV, altho that was the only part of history with which I was familiar. The day of the examination arrived. Just before it began, one of the boys amused himself by predicting the part of history upon which each of us would be questioned. His method was very simple; he opened the book at random, and considered the portion which appeared as the "fate" of that boy. For me he predicted the time of Louis XIV. "Yes," said I, "that would suit me perfectly," and related to them how I had had to learn all that for my father. The boy was just about to make another prediction, when the teacher made his appearance. I was one of the first called out. The teacher sat as usual with his chair resting on a single leg and rode, as it were, backward and forward while he turned the pages of the book to find something with which to catch me. There was a long, painful silence. Finally he

said: "Tell me something of Louis XIV." I heard half-suppressed giggles from the corners. Heaven only knows how I must have looked, at least a head taller I think, as I started. The words came gushing out like water from a spigot when the key is turned. The flow of words continued without a break; no word was left out, for all seemed absolutely fixed in my memory. The teacher was dumb with astonishment and seemed unwilling to believe his ears, but the facts had spoken and there was nothing with which he could find fault. Once more he turned to the book; once more he rode on the single chair leg. A cold sweat of agony broke out on my forehead; it was impossible to have such luck again. But my good angel did not desert me. "Can you tell me the names of the generals of Catharine II who were on the Black Sea?" With a loud voice I replied: "The Generals Greigh and Elphinstone." These names had seemed chiseled in my memory since the time my father had said that the arms of our family, upon which there is a ship, indicate in all probability that the founder of our race was the Scottish Admiral Greigh. The teacher closed the book: "Correct, for this you should get a one with a star, but in consideration of your work for the year you must be satisfied with one and a half." I was more than satisfied; I was as proud as a general who had won a victory. I almost believe that this was the greatest success of my entire school life, and the more disgrace it is to me that its real value was so small. This success convinced me of the truth of what the great Norwegian statesman, Johan Sverdrup once said in the Storting: "One must have luck; there is nothing more unfortunate than a statesman who has lost his luck."

It happened finally that one day—I was between twelve and thirteen years old—I brought to school with me a music book, in which I had been writing, and on the cover of which was printed in large letters: Variations of a German Melody, by Edvard Grieg, Opus I. I wanted to show this to a school friend. But what happened? In the middle of the German lesson this same comrade began to murmur some unintelligible words which attracted the attention of the

teacher: "What is the matter, what are you saying?" he asked. Again the confused murmur, again the question, and then it came: "Grieg has." "What do you mean, what has Grieg done now?" "Grieg has composed something." The teacher, who for reasons I have related, had very good grounds for not favoring me, arose and came toward me, and then, taking the music book out of my hands, said in an ironical tone: "Ah, the fellow is musical, the fellow composes. That is indeed extraordinary." Then going to the door of the next class room he called the teacher to him, saying: "You can see something worth seeing here, this little fellow composes." Both teachers glanced over the music book in an interested way, while there was a general stir in the two rooms. I already felt certain of a great success, but that I found should never be counted upon too soon. For scarcely had the visitor left the room than suddenly changing his tactics, the teacher grasped me by the hair until everything became black before me, and in a gruff tone, said: "Another time bring your German dictionary with you and leave this nonsense at home." Oh, dear! To be so near the summit of earthly happiness and then to fall so suddenly into the depths. How often in later life has the same thing happened to me, and in each case it has forcibly recalled that first time.

Opposite the schoolhouse there lived a young lieutenant, who was a passionate lover of music and a clever pianist. To him I went for comfort, showing him my attempts at composition; and he was so much interested in them that he asked me always to give him copies of them. That was a success of which I was not a little proud. Luckily, tho, I succeeded later in getting the copies back, that they might be consigned to the waste basket where they belonged. I have often thought with gratitude of my friend the lieutenant (who later became a general) for the encouraging attention he gave to my first productions. To my childish mind it was indeed a pleasant contrast to the cuffs and taunts from which I suffered at school.

At that time I had no idea of becoming an artist, and when the idea did occur to me I put it aside immediately

as something unattainable. When asked what I intended to be I always answered: "A minister." To be a black-coated pastor attracted my fancy more powerfully than I can describe with words. To be able to preach or speak before a listening multitude seemed to me to be something very high indeed. To be a prophet, a preacher, that was what I desired. And for that reason I continually declaimed to my poor parents and sisters. I knew all the poems in my reading book, and when my father wished to rest in his arm chair after dinner I would never leave him in peace, but placing myself behind a chair—which was to represent my pulpit—I would declaim without regard for anything. At the same time I would watch my father. Altho he apparently slept lightly, from time to time it would seem to me that he laughed a very little; and that made me happy. That was a recognition for me, and how I could torment him without end! "Only one more poem!" "No, that is certainly enough." "But just one little one!" Yes, even childish ambition knows the joyous sensation which results from giving "pleasure."

The conclusion of my school days, and with it my departure from home, came even sooner than I had anticipated. I was almost fifteen years old, but still far removed from the highest class, when one day during the summer a horseman came galloping along the road to Landas. He arrived at the door, and, drawing up his fiery Arab, sprang off. It was he, the god of whom I had dreamed but never seen. It was Ole Bull. It did not seem right to me that this god should dismount thus, all without ceremony, and behave like an ordinary man, walking into the room and greeting us all with a smile. I remember vividly that an electric thrill seemed to go through me as his hand touched mine. But then when this god condescended to jest it was clear to me—much to my silent sorrow—that he was no more than a man. His violin, unfortunately, he had not brought with him; but he could talk, and that he did. We listened, speechless to the hair-raising tales of his travels in America. That was something for my childish imagination. But when he heard that I composed nothing would do

but that I should go to the piano, notwithstanding all my entreaties. I cannot conceive what Ole Bull could find in my naïve execution, but he became grave and talked in low tones to my parents. Whatever was said, it certainly was not unfavorable to me, for coming to me, with one of his characteristic playful shakes, Ole Bull said: "You shall go to Leipzig and become an artist!" All looked at me affectionately, and as for me I understood nothing but that a good fairy stroked my cheek and I was happy. And my good parents! Without an instant's hesitation or objection all was settled, and to me it seemed the most natural thing in the world. How much gratitude I owed to my parents plus Ole Bull I realized only later. I was under the spell of enchantment and there was no room for aught else. But stay! Am-

bition was also there, that I cannot deny; and ambition is apparently very prominent among the ingredients which go to make up that complex salad which we call the "artist." But I was unconscious of its whispers. A success? Yes, but what will the reader think about it? Have I the right to consider this a success? At any rate I do, with or without permission, and with it I conclude the list of my more or less honorable successes of my school days. Since I was to relate my first success, an internal voice seems to tell me that I must continue my search still further. That, however, carries me to the Leipzig Conservatory, where I was sent a few months after Ole Bull's visit to Landas. It was not by accident that I used the phrase "was sent," for I felt, indeed, as if I were but a bundle of dreams.

NORDSVAND, BERGEN, NORWAY.

## The Slums' Point of View

BY OWEN KILDARE

[Mr. Kildare's life has been strange; the miracle which regenerated him stranger. A Bowery waif, he was adopted by an Irish couple living in a Catherine Street tenement. He lived with them till he was nine years old; then the bad conditions of his life forced him into the street. He became a newsboy. From that time on he lived a hand-to-mouth existence. He was a prize-fighter of some fame; a "bouncer" and "beer-slinger" in Bowery dives; "a lump of useless clay," as he describes himself. When thirty years old he met, in a curious way, a pure little woman, an East Side school teacher, who kindled within him the spark of ambition. In the ten years that have passed he has fought, through sorrow and pain, against mighty odds, until to-day he is a successful author and playwright. The publication of his life story, "My Mamie Rose," brought to him over five thousand letters of praise and good-will.—EDITOR.]

HAVING spent practically all my life in the tenement locality and having watched for many years the spread of the liberal and educational tendencies among my people, I could not fail to be struck by a certain palpable oversight on the part of the many professional and volunteer educators and philanthropists who have invaded our precincts with the best intent. Perhaps I am wrong in my observation and deduction, or, perhaps, if this oversight exists it is intentional and for good reasons. However, being of the belief that an honest opinion is always worthy of a hearing, I will state my case and am only too willing to be proven wrong.

You see, we—the under-dogs—have not many opportunities to express ourselves. Labor disputes are arbitrated, capital is always willing to meet its employees at the conference table, but philanthropy and pauperism have not yet reached that degree of mutual co-operation. As it is, philanthropy is active, pauperism is passive; one prescribes, the other takes the medicine without doubting or caring much very much for its efficiency. And there is good reason for arbitration in our lowest social strata. Do you think it would hurt sociological endeavor to have the "other side" express its opinion concerning certain phases of it? To effect speedy cures the concurrence of the

patient is most helpful and a parliament of paupers and philanthropists, while bringing a better understanding and removing many prejudices, will create new perspectives and will prove the absolute futility of exploiting many pet theories. We—the under-dogs—have no sufficient say in this matter. The man who can twist an old doctrine into a new shape and can find a dozen followers can have columns for the utterance of his new-fangled philosophy and is almost driven into the assumption that he is the long expected prophet. (I have read some of these essays and have, too, met some of the writers. They are remarkable—both, the articles and the writers.) But we, the swallows of the homœopathic and allopathic doses of social medicine, have to keep silent, and it is but rarely that one of us—as I in this case—has the chance to say or write something concerning the conditions prevalent among us, only to have his say ridiculed or ballooned by inflated statements.

As I and many of us of the tenements see it, all the trained, scientific and religious endeavors in the slums have, after all, the one object: to teach us the art and science of life, of leading honest, pure and wholesome lives. I have not yet heard even the most radical express the opinion that such lives can be lived without the foundation of a home. And homes down our way are still things of horror. You know what they are physically; not a day passes without having such a "home" pictured in all its hideous detail in print. That they are bad is also further proven by the spasmodic movements to furnish other dwelling places for those now herded in tenements, and by the daily invasions of women, who teach the essential features which make an orderly home.

But what about the home spirit, the home life? Can you expect to make an ideal home out of a household in which the wife, son and daughter are constantly exposed to the best influences and the father is absolutely neglected? What, then, is done for the fathers?

About two years ago, following one of my stories in a monthly periodical, in which I told of the slowly awakening desire for broader education among the younger of a certain class of my people, another writer contributed an article indorsing and improving on me. The picture gracing the first page of his article was that of an Italian laborer, who was being taught the rudiments of writing and spelling by his little son, a pupil of the public school. I liked the picture and the story because it was true—but only to a limited extent. Were these evening sessions of father and son the usual custom no stories would be written about them and they are only remarkable because of their exception. As it is, most homes are deserted during the evening hours.

The breadwinners of the family, not at all properly sustained by their noon lunch (there's something to

write about, that noon lunch), hurriedly swallow supper. If of the "advanced" order, the children, and even the mother, quickly adorn themselves for presentation at class, settlement, club or lecture; if of the "old" order, the mother goes out to do her shopping and gossiping, the daughter hastens to meet her "steady," and the son joins his particular "gang" at its corner. And the father? Well, he is tired and can enjoy his leisure. I cannot speak for other localities, but I know that the boy with hoof and horns is always waiting for these leisure hours and never misses an opportunity to "get next

OWEN KILDARE

to the old man." Our evening journals have become such fashion and etiquette teachers, not mentioning their beauty hints, that the "old man" finds very little reading in them, unless he wishes to help his wife and daughter by selecting some pattern for them. What shall he do after reading his paper? Where can he go? Of course there is the saloon, but, almost more than the saloons, the political ward clubs are bidding for his attendance—and are we not trying to keep the "old man" away from the real thing in devils?

And right here we have a striking commentary on the situation. The ward politician, always close to his people, if not of them, has long ago recognized the spirit of gregariousness among the fathers and utilizes it most mightily. He is the only one who offers to the tired men of the tenement a more or less pleasant "hang out" for the evening. He does not advertise his club, does not ask for donations or subscriptions, although membership fees have to be paid, and seems to have no trouble in engineering his enterprise. This the politician, whom we blame for most of our discouraging conditions, does because he knows the minds and inclinations of the people, to whom, through our apathy, he stands in a wrongly paternal position.

In speaking of this subject to others I have been told that a home, improved in tone by "advanced" mothers and children, cannot fail to reform the father. I hope there is enough evidence to prove that assertion; I so far have failed to see it. It is difficult to consider this without taking each nationality and race of the slums separately, yet I have found in the cases which have come under my observation that the fathers are either treated with mild and condescending contempt, or are shown that they are a cause of shame to their progeny, or are practically driven from the house. A greed for learning and advancement has sprung up which has usurped many home functions. I know that every night in the week, Sundays included, the father can go to a club. But we should not forget that most of these men, old, or at least middle-aged, have spent most of their lives in the home country, have still the old notions, are tired with

everlasting struggling and can scarcely be expected to find the right recreation at the noisy, dissertative and radical meetings conducted by the leaders of the proletariat. The fathers have lost the faculty of becoming feverish on short notice. They have their experience behind them, and now, less aggressive than their sons, they long for quieter diversion. Yet they still can reason and see, and they wonder why the great leaders, the talkers, the prophets, are so singularly absent on the day when they are most needed—the day of the ballot.

If any lasting or intelligent efforts have been made to fertilize the leisure hours of the grown men of the tenements they have escaped my notice. On the other hand, I know of several well meant, well planned and then ill fated attempts to rectify the present state of affairs. They failed mostly because of external reasons.

It seems to be very hard for those who come to the slums to understand that the period of transition cannot be accomplished in a day. Workers in rescue missions feel deeply discouraged when hearing that a promising convert of the night before—promising on account of his abject dilapidation—and converted by the weird and frenzied harangue of some theological privateer, not forgetting the bed or meal ticket, has "slid back again" on the following day. I yield to no one in my loyalty to the good, old-fashioned religion, but I hate to have lived in sin, wickedness and crime a lifetime and then depend on the version of His Word as offered in those missions to drag me from the mire of years and place me immediately and securely on the soundest Rock of Ages. It is forgotten that these wrecked men are mentally deranged by organic or nervous disorders and that they cannot become the equals of the lesser saints in the twinkling of an eye.

In a similar degree we find this same drawback in other instances. A few years ago a number of splendid women opened a "Tea Parlor—For Men Only." It met with instantaneous success. The place was filled from its regular opening hour, 10 a.m. (we have few bankers or men with banking hours down my way), until the closing time, 9 o'clock. I went

there on the third day after its opening. The twenty-three men present, with one curious exception, were from the Bowery lodging houses, seven blocks distant, every one of them a professional pauper and only fit for the workhouse or jail. The men, the fathers of the immediate neighborhood, did not hear of the existence of the place until about a week later. And why not? Nicely printed bills stating that a place where *men of the neighborhood* and their sons could assemble for social intercourse having been deemed desirable, it had been provided, and "you are cordially invited," were distributed in every lodging house on the Bowery. But the fathers were again forgotten. Some of them went eventually to look at the place, or even to enter, but very few went the second time. The place oozed an unnatural, sterilized kindness and the appointments were absolutely ridiculous from the standpoint of the men. We learn slowly, we grown-ups, yet our ballots count as much.

Then there was that club, started with the most sublime proposition of founding a place for "all sorts and conditions of men." Confession is good for the soul—and I was one of the dreamers. Ah, we dreamed and fabled of a better understanding, how capitalist and sweatshop worker would meet to enjoy equal privileges, how we would be but men, facing one another on the level of our conscience. Alas! before we were fairly started it was decided by the powers that we—not the capitalists—could not govern ourselves and we were provided with necessary and advisable restrictions. Members were invited, even sought. They came in hordes; therefore care had to be taken in their selection. This, by the way, was an appendix to "all sorts and conditions." Several representatives of the leading "gangs" were asked to become members, but as they in one or two evenings could not shake off the liberal education of the streets, accumulated in many years, they were asked to leave. Unfortunately, some people come quicker than they leave; factions formed; the president, famous throughout the world as educator and organizer, could not handle the element—and now nothing is left excepting: "To Let."

The most discouraging feature about these movements is that, altho not intended to be educational and only intended as social centers, they are almost invariably established without consulting the people of the territory to be benefited and without being assured that the need for such a movement exists there. Altho not the best illustration, the much mentioned Subway Tavern will make the point clearer. In the cleverly managed press notices preceding the opening of the place a certain divine was quoted as describing the Tavern as a "place where the tired toiler and mechanic could have his glass of beer—if he must have it—as good as it can be brewed and in as cheerful surroundings as possible—until we shall have real people's clubs throughout our city, yes, throughout our land."

That the Subway Tavern did not start out rightly and energetically to live up to its purpose and that it has utterly failed in it those who have been there recently and some time ago will admit. Above all there was no demand for it in that particular locality. Surrounded on one side by business and manufacturing concerns, on the other by an institution for children and Police Headquarters, on the third it is flanked by a row of tenements inhabited by Italians, who prefer their own saloons, where "bigger"—and worse—beers are given and where more noise is permitted. Depending for its day trade on the nearby business houses and headquarters, it is a "sight of New York" in the evening, visited by gay tourists and sightseers. The other fallacies and mistakes of the Tavern have been too often discussed to receive additional mentioning here. However, I would like to quote here a man who has lived for over twenty years in Elizabeth Street tenements—two blocks from the Tavern.

I asked him his candid opinion of the Tavern. He had been to it—once.

"Oh, I guess it's all right. Them two blocks over there have never been much good for the liquor business since the high license, but that Tavern 'll make out all right with all the advertising it got and the many swell people that go to see it."

"But don't you people of the neighborhood frequent it?"

"What'll we do that for? They have nothing there that I can't get better right two doors from my house. Besides, they're a company or a corporation, and they're the devil to do business with!"

"But don't you think it will have a certain influence on the neighborhood?"

"Influence? Influence? Are you kidding me, now?" Yet he grew serious. "When I see how them rich people spend money to do something for our wives and children I take my hat off to them; but when they get 'bit' for a thing like that, when they let every Tom, Dick and Harry come along and get them to put up money for that kind of a thing and think we want it, then I know they don't, or don't want to, understand us—and I get discouraged."

The point of the above is that many of my people on account of the ill advised and foolish experiments practiced on the slums have lost their faith in the sagacity and sincerity of the philanthropists.

Yet, in spite of great obstacles, so many things have been made possible that I am fain to believe people's, or at least men's, clubs of the right sort should be feasible. Another feature, perhaps attractive to some investing philanthropist, is that they would be self-supporting, paying fair interest on the capital. Have we not the Mills Houses as glorious examples of philanthropic investment! Built to pay four, they are now paying close on twenty per cent. Yet, with all possible appreciation of the boon they were to bring, many of us who understand the true conditions in slums and lodging houses would like to see them closed to-day. But this being hardly to the point, let us return to the practical side of the clubs.

Less than one hundred thousand dollars would equip club houses or rooms for over thirty city wards. A moderate membership fee should be fixed. Among other sources of revenue would come the payment for games, special entertainments and the rent of the hall for all sorts of neighborhood doings, not forgetting the politicians, who should be only too welcome to expound their platforms to the club members. The election of the first officers and the original starting of the club will not be easy, but will repay early disappointment by continued

permanency. Factional disruption, political partisanship and other threatening dangers should be easily curbed or made impossible by careful charter and by-laws. Not to be behind the Subway Tavern, the selling of drink should be left to the option of each individual club. Not one of them should be started with a bar. By the time the men have sufficient funds to think about the bar they might have outgrown their strongest longing for it. If they must have it, let them own it and, in part at least, receive their money back.

I have neither the space nor the intention to go deeper into the club project at this time. But I want to assure you that the men can govern themselves and that they are ready to spend their leisure hours decently. They will not be patronized and must be handled with the same tact exercised with the members of our fashionable clubs. Above all, every member of the club must be a resident of the ward, or, at least, must have a home, and the club must not become a "sight of New York"—not until you will escort idle gapers into our houses to show them "how they live."

I need not add that I have not the training to give you a scientific treatise on the subject. But I know what the men do now in their leisure hours and what they could be made to do. Only too frequently these men are misjudged. I am often astounded on hearing people who should know better speak of Bowery lodgers as men of the tenements. Less than a tenth part of the fifty thousand men who sleep, night after night, in lodging houses come from the tenements. The creatures of the lodging houses are the black sheep of decent families, wrecks of their own folly, discarded relatives, idiots, made that by some domestic tragedy which unbalanced them; undesirable immigrants, lured here by promises of plenty—in a word, they are the human junk heap of the country, picked up from miles around and heedlessly thrown into the dives and lodging houses and left to rot.

The man of the tenement? Oh, he broods and "dopes" his life away and would crack many a joke at the expense of his brother, the ox, did he but know of him.

I cannot rid myself of the opinion that the solution of many of our existing evils lies in patriotic politics. And what can we expect if we leave him, he of the vote, absolutely to the ward heeler, who, so far, seems to be the only one to understand the "old man"? While it will be

very difficult to make saints out of the men of my people and while the clubs will never accomplish it, the men, through the clubs, will gradually come out of their lethargy and will come closer to their families and their land.

NEW YORK CITY.

## A Prairie Home

BY E. P. POWELL

AUTHOR OF "OLD FARM DAYS," "THE COUNTRY HOME," ETC.

A BUNCH of letters lies before me, all claiming an answer; but this will be quite out of the question. Most of them offer specific difficulties in the way of making country homes—difficulties that are quite too local for the general discussion which I have undertaken. One of the more important is from a physician who is debarred from expensive undertakings in the way of horticulture, but whose love of the land and its appurtenances overwhelms his taste for professional life. He has obtained a country lot of a few acres, where he is already growing his vegetables and planting fruit trees. He says:

"Your articles have set me to thinking if I can do anything better than to study nature just as she is and merely take advantage of irregularities, slopes, swells and swales. Clearly I am to let my brook run as a brook, and not make a ditch of it. I am also beginning to see that the trees that nature has planted rather irregularly along my line fences are some of the best of my property. Until I read your articles I was going to cut them down. I shall now plant more—oaks, elms, maples, lindens, and even the hardhacks are doing me good service; that I see. A cluster of sumachs at a bend in the brook has been a thing of beauty in the early autumn, so that I crave more of the same kind and nearer at hand. Possibly in time my efforts may be bent to something of a creative sort—scientific cross-breeding."

This part of the letter is all right; only do not plant more sumachs. There are many more exceedingly beautiful and choice bushes growing in your neighborhood, all demanding attention and rever-

ence from a nature lover. Make it a part of your business to collect all of these that you can and group them as wisely as you know how. If you make mistakes the charm of it is that you are all the time a pupil of nature and not a master. The world is trying to reveal itself through us, and in the garden and orchard and on the lawns it is our business to write out our daily lessons—or at least our yearly discoveries. A physician practicing in a city or village can do nothing better for that wonderful something which we call health or wholth—wholesomeness—than to practice and encourage others in the practice of gardening. Get them out of doors and go with them as far as you can.

Turning over the list I find another letter from a Methodist Episcopal minister and his daughter. They have already in possession one of the most beautiful properties that the country can afford. Both of them believe that they need advice. My opinion is that they mostly require experience. The daughter writes:

"We want a pretty, well planted place, one which will improve; and as you said in one of your articles, we don't wish to get in such a fix as to hinder natural evolution. We want to let nature have a hand in the job. We are twelve hundred feet above the sea level, and the landscape nobody can rob us of."

I am quite sure that these people will be abundantly able to work out their own problem. The sketch which they send me shows that they are working with brains; that is quite enough; and this is reply enough.

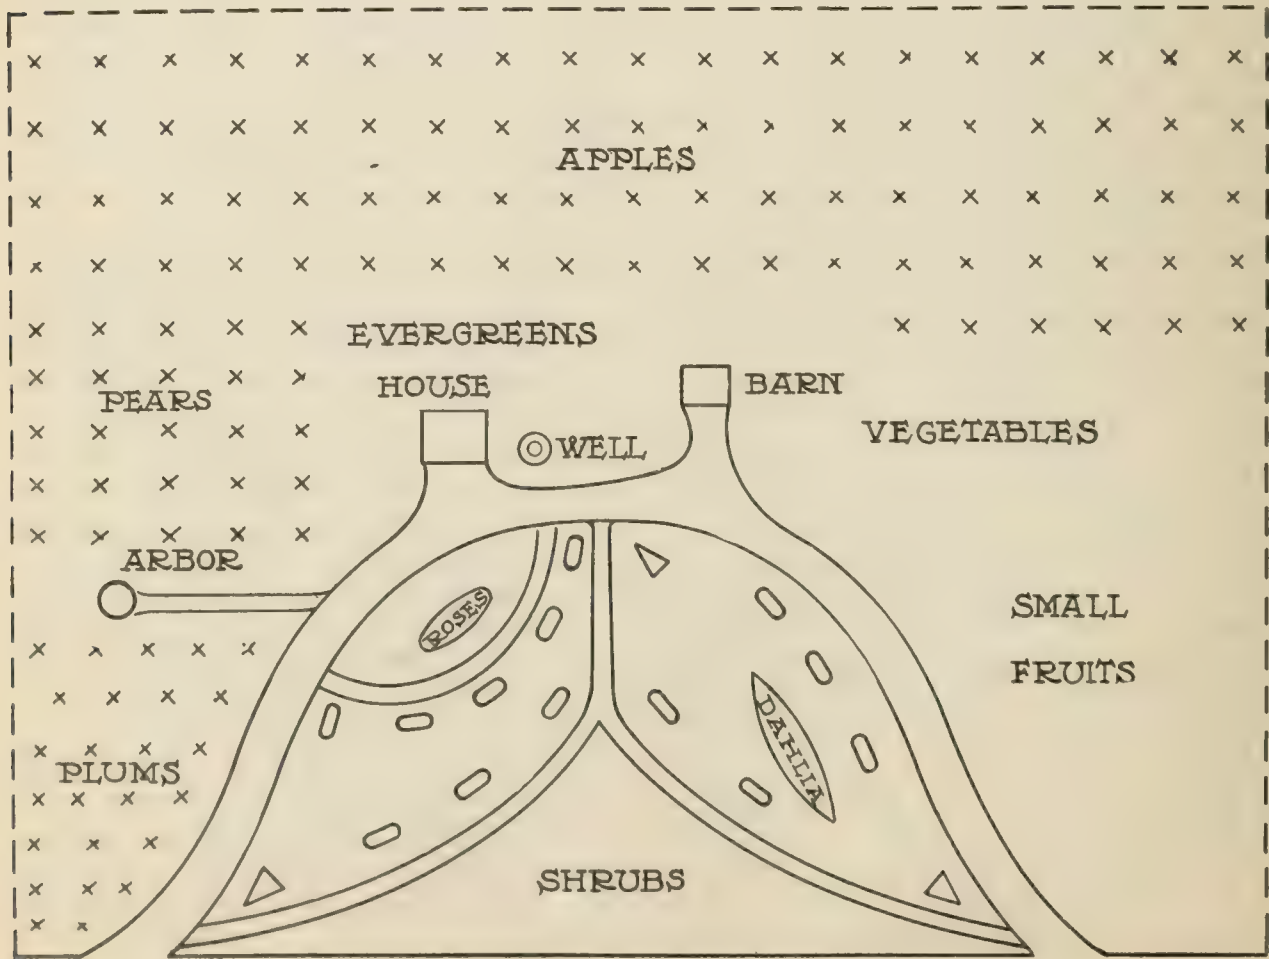

This article shall deal mainly with a letter from a Western girl, who writes:

"I am greatly interested in your articles in THE INDEPENDENT about making country homes. Every one of your contributions so far has been concerning places with hills and brooks—not one line about prairie homes. I have one hundred and sixty acres in Christian County, Ill., where the soil is very productive, but the ground absolutely level. I have thought that maybe some of your books or magazine articles might be of help to me in planning for the buildings and in making the grounds as pleasant as possible. Can you tell me of some one to whom I can send such plans as I have, and have them returned to me with suggestions that will enable me to make yearly improvements?"

It surely is a fact that when we go from the East to the West we not only leave the hills and brooks, but we have to learn over nearly all the arts of gardening and orcharding, and in general of making a living. The sun burns more steadily, with fewer clouds to interrupt the beams. Yet with good culture and common sense planting nature responds superbly with flowers and fruit. I am sorry to say that when I lived in the

West I found very few beautiful prairie homes. Perhaps there is something in the gurgling of brooks and in the vision of far off spreading landscapes that makes not only poems in our souls, but compels us to write poems on the sods.

Notwithstanding the absence of much of the material which we use so freely in making beautiful country homes in the Eastern States, and, again, in the far Western, a prairie home may be made to be very beautiful. Windbreaks are even more important there than elsewhere—indeed, you can do nothing without them. Your first aim must be to create diversity; and this must be accomplished mainly with trees and hedges. I know the charm of an Eastern orchard, but there is a certain peacefulness under the trees of a prairie orchard that is indescribable. In the second place, you must have living arbors and pleasant walks. That which will draw the eye is not a distant landscape, but something near at hand. You must make a great deal of small things. I think that in these Western homesteads it is necessary to mingle fruit and flowers more freely.

In Michigan I bordered my flower beds with strawberries. Then just before sunset I opened my garden gates and received my parishioners. They knew the hour when I would be there, and it was delightful to sit on the sod couches and eat strawberries out of hand. To make all that I could of it and get the most out of it I constituted the group a committee of judges who should carefully test the different sorts and report to me their investigations. The one absolute requirement of a home on the prairies is trees, trees, and then more trees. The object is relief and peace. We must break up monotony in some way, and then the spirit of peace easily broods on the orchard or garden.

The use of hedges is an absolute necessity, and you must grow them large enough to allow the imagination to believe that there is something else the other side than more prairie. Connected with these living arbors of evergreen help decidedly in the way of creating diversity. We must make more of pleasant walks, while flower beds may be multiplied without limit. In other words, your garden must be approximately that which is popular in France, rather than that which we approve among our Eastern hills. You must go from fruit tree to flower bed, and wherever you turn must find something of interest, sufficient to compensate in part for the absence of distant scenery. Standing on an Eastern hillside we look over a valley which nature has planted and which remains a garden, however much man may cut or plant; but on these level swards of the West nature works very differently, and we must do likewise. She multiplies flowers without any restraint, and it is underfoot that we find our landscape. Trees and flowers, these are the materials which she gives us to work with. Always plant trees and shrubs, and then more trees and shrubs.

One more thing you can do that cannot be so freely indulged in in the hilly States: you can make vast spreads of special flowers. I think I have seen a quarter of an acre of cardinal flowers, all in one mass, on a wet prairie. And then the cypripediums and the gentians, how they do love to look into each other's eyes and gossip all along the ditch sides

—for while lacking the playful brooks you can get ditches and you can make them very beautiful—more artificial than a brook but still gorgeous. There are few prairie homesteads that cannot either find or create a spot where cypripediums will be perfectly happy. It is not necessary, however, to confine this bedding to native plants. I found in my Michigan garden that lantanas and dahlias and roses could be used *in extenso*. I used to surround them with closely growing shrubs or even hedges of evergreen kept about two or three feet in height. Many of the bedding plants of the East will, however, need more shade in the West, such as fuchias, begonias and ferns. The abutilon will do well in the drying heat, and the salvia I have never seen in such glory as when grown on the prairies.

In Missouri, where there is little summer rain, I found no plant comparable with the geranium, and this I recommend to you anywhere on the prairies. It will stand more drought than any other bedding plant, and continue a profusion of blossoms. If, however, you do not care to shoulder the expense of bedding plants, be sure you will find enough wild flowers to fill up your garden. Among these I used to grow the lupines, the primroses, bleeding heart and its relatives. There are hundreds of beautiful things put down like a carpet on the prairie land. But I found especially rich collections wherever there happened to be a wet swale. The shrubs are more in number and I think richer in beauty than those that I find along our forest edges in New York. But mulch everything. I found it absolutely necessary to cover the feet of my rose bushes, and equally needful to put a few handfuls of mulch about every aster or petunia.

Carrying out this idea of planting more beds of flowers, and relying more upon art, you will find that you have growing under your charge a number of flower beds that in an Eastern garden would be superfluous. In Michigan I had upon less than two acres eighty beds, with walks about as dainty and delightful as you would find in a Japanese garden. But then, as pastor of a busy church, where young people were specially at home, I assigned to several of

my church boys a bed where each could cultivate what flowers he chose—of course, under some supervision. I am quite sure that that garden did a good deal of preaching of just the right sort. It was delightful for the lads to hunt up their pastor and take a mile's walk for a couple of hours of co-operative gardening. I read Froebel with pleasant recollections where he says:

"Thus may father and son, teacher and pupil, parent and child walk together in one great living universe. Let us observe, lead our pupils to observe, and so render them and ourselves alike conscious of the real meaning of what is about us."

I believe with Hodge that

"No one can love nature and not love its Author; and if we can find a nature-study we shall be laying the surest possible foundation for religious character. The child that plants a seed or cares for the life of an animal is working hand in hand with nature and the Creator, and what higher religious development can we desire than that he become the reflected image of God?"

If I were young enough to again take up the work of a pastor I would have more of my flock at work in a great big garden. Each one should work out his own individuality, confident that he would work into it much of the individuality of the flowers. But what I want to get at is that you can make your big garden a big part of your family life. Boys and girls that would get very sick of barnyards and plowed fields will get immensely attached to a flower-surrounded homestead. And all their lives, if compelled to leave such a home, they will think of it and long for one like it till they get it.

The prairie is not the natural home of a lot of our most charming birds, but the soil is full of that sort of life which modern science teaches us to investigate. I shall never forget the earnest appeal of a girl of fifteen who said to me: "Do please make Will go straight home from Sunday school. He stops to poke under every old piece of plank, lifts the stones, and even pulls up the plank sidewalk, hunting bugs and everything else that is nasty, until his pockets are full. He even puts them in his hat." I visited Will that week to find out what the chap

was doing. His room and as much of the house as his mother would permit were the queerest sort of a museum you ever saw—a regular Noah's Ark of living things. Some were crawling and some were hatching. To-day Will is one of the most noted entomologists of the West. You may also very easily win the birds to be at home with you, so soon as you have plenty of trees for shade and nesting places. The robin is so partial to the company of human beings that he will find you out very quickly; and, if you keep your cats shut up during the nesting period, the catbird and the brown thrashers, and even the tanagers and grosbeaks, will locate with you. Olive Thorne Miller used to say that the special business of the robin was to make it possible for human beings to be happy. He comes close to our houses and enters into a sort of copartnership. I found in my Western garden that I could even draw to me the wild wood doves, and that with gentleness of manners I could make them feel quite at home, nesting under the eaves of an arbor in a grape vine, where I could sit within three feet of the nest.

Among the trees that take to the prairie you must never overlook the locusts. The tulip tree and the walnut are pretty sure to adapt themselves to your dark, rich soil. If you want to create a cozy corner in your pasture, where the cows may lie down in the middle of the day, try thorn apples, and then let them be grown all over with grapevines. Seedling pears make another first-rate retreat from the burning mid-day sun. Hackberries, hawthorns, plums, mulberries, crab-apples, dogwoods and wild cherries will take right hold to make you good windbreaks and hedges. The Kentucky coffee tree and the basswood, or linden, as well as the chestnuts, butternuts and hickories, I found could be had very freely, and along their edge one might plant hazels, pawpaws, barberries and high bush cranberries. The catalpa is hardy and natural to almost any section of the Western level lands. It is one of the most beautiful of all our trees in blossom and in foliage.

I have never found living on level plains so very tedious in the summer. It is the winter that makes these dead

levels and treeless districts dreary. Be sure that your planting takes this into account. I would first of all surround my house with a plenty of evergreens, whatever sort is native to the section or grows nearest to the locality. Then I would have orchard trees all around me. There is no tree in the world that will give such a homeful look as the apple, even in winter. There is something about it, just as there is about a robin among birds, that makes it fit to human moods and needs. A great deal can be made of those shrubs that bear bright red berries all winter. Do not be afraid to group them in large quantities. Vines are useful at all seasons, and grapevines are as beautiful in their climbing as they are in their fruiting. One of the most attractive Western gardens that I ever saw was made up as I have described above, with lots of walks and flowers; but the owner had also collected, from far and near, all sorts of stones—some fossiliferous and some geologically interesting, but mostly attractive for their

oddity. Such a garden does not grow tame as the leaves fall off.

So you see that your prairie home can easily be made a joy and a thing of beauty. Do not be afraid to let nature play some pranks and carry some things back to the wild after you have done your planting. I should know that I was in Indiana or Michigan, if taken there asleep, by the thorns and haws covered over by grapevines. No such arbors can be manufactured as nature creates. Still you will miss the brooks more than anything else. You must compensate with an artesian well, around which you keep basins of water for the birds to bathe in. Have an arbor over your well. Let it grow almost like a thicket, so that underneath it will be cool and damp. In other words, let your first work be to study nature, and then not balk her when she tries to assist you. The chief trouble with the prairies is that they have been burned over, and nature has not been able to do half as many fine things there as she would like.

CLINTON, N. Y.

## A Song of Love

BY MARY H. LEONARD

IF power to speak with angel tongues were mine  
 How like a tinkling cymbal were the sound,  
 Or clanging brass if lacking the divine  
 Graces of Love that in true hearts abound.  
 Tho I to feed the hungry should bestow  
 My worldly goods or had the power to move  
 The solid mountains, still my soul must glow  
 With Love, or profitless it all would prove.  
 Love vaunteth not, is seemly, kind and meek,  
 Rejoiceth only in the true and pure,  
 No envy feels, her own she doth not seek,  
 Believeth all things, and can all endure,  
 Faith, Hope and Love abide eternally:  
 But surely Love is greatest of the Three.

ROCHESTER, MASS.

# Disarmament and Union of Nations

BY HAYNE DAVIS

[The following article is particularly timely just now when the annual Peace Conference at Lake Mohonk has just closed, for it shows there is no inconsistency in working for peace and preparing for war at the same time, and therefore those who work for a larger navy and those who strive for international arbitration can logically co-operate.—EDITOR.]

President's Standard

THE advocates of disarmament and of limitation of armaments have been working along negative lines. Those who lay stress on the execution of treaties of arbitration and on the creation of a Congress of Nations are putting forward a positive plan, which is always better than to oppose the positive plan of some one else. But this is especially true of the Peace Movement. To succeed it must win the adherence of those in the control not of one but of many nations. They cannot be won over to the disarmament or limitation of armament plans, but even those who favor increased naval expenditures for the United States are declared advocates of treaties of arbitration and seem favorable to the idea of a Congress of Nations. The hour has struck, therefore, for all advocates of peace to unite in a campaign for treaties of arbitration that give The Hague Court jurisdiction and for a Congress of Nations to supplement this Court.

Indeed, these things will cause the navies of the nations to dwindle in due time to a mere International Police Force and will therefore effectually accomplish disarmament. The Constitution of the United States gives convincing proofs of this fact.

When the States united to form the Union they specified that the Federal Government should never forbid the individual citizen from carrying arms. This was done in order to enable the States to raise an armed force quickly if the Federal Government should ever do anything that threatened their rights. The States have a right to forbid the carrying of arms by individuals, but prohibiting the carrying of *concealed* weapons is the present limitation on individual armaments.

The States agreed to do away with their navies, and the United States agreed to maintain an adequate one. The States agreed to do away with their armies, but they reserved the right to maintain a militia, and to drill it in time of peace, and to appoint the officers of it even when called into the service of the Federal Government. Why? Because the States thought their officers would be able to carry the militia under them on the side of their State in case the Federal Government encroached upon the liberties of the States. In addition to these things the States enacted that the Federal Government guarantee to the States perpetually their republican form of government, and at the same time the Federal Government was forbidden to take a hand in any difficulty which arose in any State until called on by the State for assistance.

I held in my hand the other day a commission issued by John Jay as Governor of New York and "Admiral of the New York Navy." Where is the New York Navy now? Sunk in the depths of the American Constitution. But it would be proudly anchored in New York Harbor ready to engage the navy of Massachusetts or Virginia if the States had not formed this Union.

These historical facts shed a clear light on the path to peace. Peace can come

only as a result of political organization of nations. It can remain only so long as the Union of Nations and the constituent members respect what are regarded as the essential rights of the nations so united. These things assured, disarmament will inevitably follow, and in due time peace. But the day of permanent peace will dawn *after, not before*, the organization of a Union of Nations in the image and likeness of the United States. Then, and not till then, navies will vanish from the ocean, leaving a mere remnant to serve as an International Police Force for execution of the laws and judgments of the Congress and Courts of the United Nations.

Unwise advocates of peace may regret that the day for beating all swords into plowshares and for converting all men-of-war into merchantmen has not yet fully come, but the wise will remember that this day was several thousand years away from those who first foresaw and prophesied its coming, and we will congratulate ourselves that it is not far from us. When nations give The Hague Court the right to summon them before it, and create a Congress of Nations to declare the law which this Court of the Nations must apply, then this prophetic day will have dawned upon the world. This final consummation in the evolution of government must be wrought out in the midst of war. In this respect it is no different from other Governments, for every existing Government has evolved itself in the midst of war, and so must the last and greatest, the nation of nations.

Looking over the field on which the war for peace must be fought, we see nearly fifty political bodies, each of which has heretofore claimed the right to do as it pleases in affairs which concern the others as well as itself, with the result that there is a periodic outbreak of war among them. Every one of these bodies is founded on the idea of respect for law among the units comprising it, whether these units are individuals or States. It stands to reason, therefore, that nations cannot forever practice toward each other what is punished within every one of them as a heinous crime—*i. e.*, lawlessness. The light of this began to dawn as the nineteenth century drew to

a close. A Parliament of Nations was held in 1898 at the request of Russia. The outcome was a declaration by the assembled nations that a Court of Arbitration should be constituted for trial of international controversies, "*on the basis of respect for law*" by the nations. This declaration was in itself a great step forward and was soon followed up by the actual organization of a Court of the Nations and by submission to its judgments.

"Respect for law" necessitates, however, not only a court to apply the law to particular controversies, but a suitable method for declaring what the law is. The law which is recognized by the nations has grown to a considerable volume by common consent. But under the complicated conditions which modern discovery has created common consent is not a suitable method of adding to or amending the law of nations. An assembly in which this consent can be given is imperatively demanded. This has been recognized by representatives of practically all Europe, assembled at St. Louis for the twelfth session of the Interparliamentary Union, when a declaration was made in favor of a second Parliament of Nations, and this Parliament will soon convene, at the close of the Russo-Japanese War. It will be bound to entertain the idea of the Interparliamentary Union that such a Parliament should assemble periodically to assist in the discovery and declaration of those laws which the nations are to respect. But even if the permanency of this body were not a part of the program, the discussions at this second International Parliament would doubtless end in a request that a third be held, just as a first resulted in a request that there should be a second. It is practically assured, therefore, that an Assembly of Nations will be held periodically hereafter, whether it is constituted as a permanent part of our Governmental system at the coming Conference or at some later one. Meanwhile treaties of arbitration are being entered into between many nations which bind the contracting Powers to respect law and judicial decisions upon questions included in the treaties.

Under such conditions some men in the Peace Movement and some important papers make complaint that President Roosevelt's policy strengthens the hand

of the war party in all National Parliaments, because he advocates a powerful navy for the United States. They ignore or fail to comprehend the full significance of those parts of the President's Message which deal with treaties of arbitration and with the call for a Conference of the Nations. They fail to comprehend the relation between national preparation for war and international organization for peace.

As nations are organized on the idea of using force to effectuate their will, the men in control of a nation can co-operate with the advocates of peace only on the basis of national preparation for war in proportion to the nation's interest in international affairs. Asking them to do otherwise is practically a request that they ignore conditions as they exist, and act as if that were already accomplished for which the advocates for peace are now striving.

If this fact is frankly faced and all who want to promote peace through governmental action will co-operate on this basis great strides forward can now be made. By calling for a Conference of Nations the President has made it possible for a permanent Parliament of Nations to come into being. He may put too much stress upon national preparation for war and not enough on international organization for the preservation of justice and peace. The device on the President's personal flag and on the silver money of the country indicates the right attitude of this nation at this time on these subjects. The olive branch of peace is in the right foot of the eagle. The arrows of war are in the left. With the right hand of strenuous effort and

ample money appropriations this nation should hold out to others the execution of treaties of arbitration and the constitution of a permanent Congress of Nations as the real means of establishing justice and promoting the welfare of the world. Reluctantly this nation should make such preparations for war as existing conditions require. The outcome will show where the President places the heaviest weight of his powerful influence.

This is no time to be overzealous to know wherein we differ from those willing to co-operate in the cause of peace. It is a time for all parties in the United States Congress and all parties in the Peace Movement to hold up the hands of the President and of those who are sent to the Conference of Nations, and work together for treaties of arbitration which give The Hague Court jurisdiction, and for a Congress of Nations, until these things are accomplished. This is a positive policy on which all can be united and which can and will be successfully carried out.

Viewed in every possible light, the present conditions in the political world should inspire all the advocates of peace with new courage and zeal, to be expended in work for the constitution of a Congress of Nations and for treaties of arbitration which give The Hague Court jurisdiction. If they will throw all their energy into the accomplishment of these things, instead of opposing war appropriations, even the advocates of increased naval armament will co-operate with them, and they will win by the help of those whom some of the advocates of peace have heretofore felt bound to oppose.

NEW YORK CITY.

# Fashions in Fiction

BY MRS. L. H. HARRIS

WE are all mere fashions of the eternal man, varying from age to age according to prevailing ideas and conditions. It follows, therefore, that fiction, a branch of literature dependent upon the ups and downs of human nature for its inspiration, must change with these ever changing heroes and heroines.

Occasionally, to be sure, some one retires to his chimney corner and writes an idyl, a poesy romance, founded upon his own heavenly mindedness rather than upon the prevailing apocryphal phases of life about him. But such a book is rare and it never is read by any one except the author's compassionate friends, because it is the man's own book and does not belong to the public any more than a hermit belongs to his generation. To be in the fashion, a novel must be written for everybody. And most of them are. One can tell it by the author's cordial hand-clasp with the sensational and the obvious, by his literary peddling of popular immoralities, by his genius for reproducing the passing show of things. With him romancing is a business, and no one shows more shrewdness in the commercial world than he does for trading the sins of human nature into fiction's fashion. For, be it remembered, our sins fetch a better price there than our virtues. And they are no longer spiritual illiteracies resulting from ignorance, but, according to certain writers of fashionable fiction, our old Adamic foundation has become the chief cornerstone in modern character and the very seat of the hero's unscrupulous intelligence. "Belchamber," an English novel just out in this country, is an illustration of this dignifying process. The author's literary style fits like a fashionable cloak every iniquity of which well-bred, or ill-bred, men and women are capable. And not one thought is omitted that could darken the picture. This is significant because the book is so thoroughly intelligent and so disheartening. It is the curi-

ous effect which the power of comprehension has upon some people. According to their dramatic representations we have had a great migration of mind toward knowledge, but not toward virtue. They make an awful fashion of our shortcomings because they endow them with grace and make them *conscientious*. They lack the originality to conceive of virtue. A new fashion in fiction will develop when our novelists can portray in terms of personality the fact that *goodness* is so inherent in human nature that it is found nowhere else. Mr. F. Hopkinson Smith in his stories, "At Close Range," comes nearer than any other author this season to the golden mystery of virtue when he demonstrates that it is the thing that lasts in every man beneath all the phases of his evil tendencies.

Now this brilliant misanthropy has been for so long a popular mode in fiction that the reaction against it in the revival of religious spirituality might have been conjecture; but, as a matter of fact, it has already begun.

There has always been a certain amount of religious cant in fiction, just as we have had the conventional "church life" feature to contend with in Christianity. But the better class of authors either avoided the subject with agnostical indifference or treated religion from a rational point of view and often with a secular wit that was spiteful rather than enlightening. And because this was in a way justified by a pharisee phase in human nature they neglected the older element of spirituality. Meanwhile, there has been much talk in certain quarters of a "great awakening." A young man in Wales confirms the report with a revival that sweeps the country. Evangelists have been going through the large cities proclaiming the kingdom of heaven at hand as if this was an entirely new dispensation, a "bargain day" season in salvation. But Wales is a small country, not equal to one little parish on the earth's great heathen surface; and

the nomad priest who lives in a "gospel tent" usually affects the emotion more than he does the character of a community, and so very few have accepted the idea that there is really a change in the spiritual temperature of the common life. Religion has been so talked about, so darkened with theology, that we have been near forgetting that it is an actual experience. But the novelist less than any other interpreter of voices can afford to miss the keynote. A preacher may do so and his dogmas survive a hundred years, but the writer of fiction must square fiction with fact or it ceases to be interesting, flattering, to the people who read it and see themselves portrayed in romantic coloring, *and the novelists are recognizing the revival of religious emotion in the common man.* There is an element of spirituality in the new novels struggling for kinship to that which inspired the old hymns. Quiller-Couch's study of the Wesleyan period while preparing his story of Hetty Wesley has profoundly affected his literary understanding of the human character, and it has added an anthem phrase to his interpretation. He has realized in his new story, "The Shining Ferry," the spontaneity of religious spirituality and embodied it as an aspiration in the hearts of simple folk. And he has not weakened the effect by one sentence of modern reasoning or explanation. It is an involuntary expression of hope which leaps from the lips of his men and women like the song of birds. And Max Adeler, whom every one supposed to be a mere humorist, almost surpassed him in "The Quakeress." Nothing has appeared in volumes of sermons or elsewhere which is so near to scriptural preaching as the discourses delivered by George Fotherly at the Friends' meeting in that story. It is not that the author *says* the man believes with awful simplicity in the doctrines he proclaimed, but it is the impression produced of a faith which transcends reason. And the effect upon the dully prosaic mind of the reader is magical. Again, when religion has been made a feature of Occidental literature it is either as Christianity, sectarianly distinct from the heathen phases of religion, or there was an egregious effort made to combine it with these, to adul-

terate both the pagan and the Christian faith with a combination of certain elements selected. But in his story of "The Dryad," just out, Mr. J. Huntly McCarthy gives Christianity its poetic relationship to these elder creeds, without discrediting its reality or detracting from its distinctively Christian significance. Now this poetic setting of our religion has hitherto been neglected in fiction. But it is an important development, founded upon a profound philosophy of the situation. For, whatever may be said of his mind, a man's spirit is formed for ideality, and religion must be a poetic formula of godliness in him. It can be more, in practical demonstration, but it *must* be poetic. The question is, How will the general reader, fed now for twenty years upon more or less agnostical fiction, receive this revival of the old hymnal Christianity in his romances? And that is the test. If he accepts it we shall have more of it and the "great awakening" will sweep in upon him like a spring flood along his love channels, which is by no means a sacrilegious route for heavenly mindedness to take.

Love is the same always, a sort of pagan sanctification which the devout and the undevout enjoy alike, but the expression of it varies; and nothing undergoes more radical changes in fiction than its sentimental vocabulary and mannerisms. Formerly the hero was in love with the heroine when the story began, and he said so in a language of honey words. Her heart was often in the grave with a dead lover, but by dint of much kneeling and coaxing he was able to win it back, and by the time we were half through the tale she had allowed herself to be caught to his bosom in a paroxysm of tenderness, on his side, of course. The tears hung upon her lashes like pearls, and nobody, least of all the guilty young man, knew why "she sobbed convulsively." But, anyhow, they married and lived in such a state of stupid bliss that the author was usually obliged to introduce a new pair of lovers to make the story long enough. That, however, was in the old days when men had not lost the art of courtship. Now the man and woman meet in the first chapter of a modern novel upon an intellectual, or social, or industrial, basis that is sup-

posed to be equal. Then the author devotes twelve chapters of private confidences to the reader concerning the woman's matrimonial designs upon the man, who is determined to remain unwed. But the tendency of the times drives them to take a mutual interest in settlement home work, or to lead a "strike" together, or to read the same course in science. No matter what the man does he cannot escape this prevailing woman. She enters and remains beside him, she makes herself useful and indispensable to him; and, altho he hates her very fascinations, she at last leads him to the altar, conquered but sullen—while the ingenuous author stands back like a successful stage manager, wipes the perspiration from his brow and winks at the disgusted reader.

And if the manner and speech of love are changed, the personality of lovers is no less changed. This is a description of the heroine of a serial story that appeared fifty years ago in *The Southern Literary Messenger*, which was then the leading magazine in this country:

"Fair, yes more than fair, was Nina Hamilton, and there was more than mere beauty in her bright child-like face. The daughter of a wealthy and aristocratic Southerner, she inherited the warm impulsive feeling of our Southern land, while from her mother she derived the almost ethereal beauty of form and feature, once the clear marble complexion belonging to Northern climes. With her small and well rounded figure she united a grace and ease of carriage seldom met with, and her face, 'twas one of Nature's masterpieces. Her features were delicately molded, and of Grecian regularity. The bright blue eye, so speaking in its glances, when once seen was not soon forgotten, and the smile was one of those whose influence all must feel, . . . and as you gazed you thought:

'The light of love, the purity of grace,  
The mind, the music breathing from her face,  
The heart whose softness harmonized the whole;

And, oh! that eye was in itself a soul.'"

A most incredible young woman, surely, but whatever suggestion there is of reality is not sinister, but innocent. It is evident that at that time writers of fiction had not learned the art of innuendo when referring to feminine potentialities. And in those days a reader might lay aside his novel with the comfortable assurance that the heroine would

be sitting at the beginning of the next chapter where he left her, upon the summer house seat beside her proper lover. But now if he delays an hour to finish a modern story he may find the heroine has meanwhile eloped with the most respectable married man in the community and that the remaining chapters are devoted to showing how happy they are in their indecent love and how miserable they are in their disgraceful sin. The effect is morally distracting. And one is curious to know whether the element of revived spirituality referred to above will survive in such an atmosphere.

We have the same hills and valleys now that we inherited from Adam, but the scenic effects in fiction are as completely changed as if we had a new heaven and a new earth once or twice in a century. Not so very long ago the author of a story merely said, "It was a beautiful morning, Alicia stood within the grove awaiting her lover." No mention was made of tragic hilltops frowning in the background. The boughs above her head did not point warningly in any direction, as they sometimes do in, say, Mrs. Elizabeth Phelps Ward's novels. At the very most there would be a hint of rain, a romantic little "thunderhead" in the West to relieve the glare in an otherwise too brazen sky. The descriptions may not have been of natural scenery, but at least nobody tried to make it supernatural. Now it often happens that Nature has nothing to do with that portion of the earth's surface which appears in fiction. We have romantic scenery, made up like the plot to suit the characters in the tale. There is always a body of water shining in this kind with two lovers drifting over it in a misguided boat. We had an illustration of it recently in "The Clansman"; for, strange to relate, Mr. Dixon, who has a most blood curdling imagination when it comes to dispensing historical facts, excels in this kind of thing. He is the only writer we have now who will dare to put a "bosky dell" and a "lovers' leap" in the same chapter. But Mr. Dixon is as gifted in sentimentality as he is lacking in esthetic veracity. On the other hand, Eden Phillpotts has a murderer's instinct for dealing with natural scenery. There is something so

threatening and perilous in his Dartmoor landscapes that the reader has the sensation of carrying his life in his hand as he reads. Some female novelists (nameless here for prudence's sake!) who attempt to produce the same danger-compelling impression fall ludicrously short in the effort. When one of them gets the hero out on top of a high mountain and casts a storm over the scene so that the poor, wet young man may be seen in the awful attitude of challenging heaven's thunderbolts it is not so terrible as she thinks it is. The sky merely gripes. It is apparently too much engaged with its own sufferings to take a forked lightning flash at the daring hero. As the description progresses one can see that the author grows violent with the wind of words, but so far as the heavens are concerned it is a forced issue. Nature never designs or expects that kind of storm. But this class of lady novelists never know when they have done enough to refresh the landscape. Occasionally one of them will borrow an alcoholic simile from a drunken poet (without giving him credit for his own stormy debauchery in words, until she is forced to do so) and hurl it into the sky of the tale with as much vehemence as if she was Jove's third-cousin and not the obsequious underwriter of a dead man's drunken foolishness.

But if these women take a literary advantage of the weather, some men writers are equally presumptuous in their use of the earth in fiction. Last year Charles Marriott made a pedestal of it for his heroine, "Genevra." He sketched into his initial chapter as much of it as he could see, and then called upon his readers to witness that it had no significance until Genevra herself appeared, looking like a red-headed Statue of Liberty upon the middle elevation. This, by the way, is a very old ruse in literature for accenting the human. Something like it occurs in the first chapter of Genesis. May Sinclair explains it in "The Divine Fire," when she says of certain writers that "they can't distinguish between nature and the human soul." And by way of intimating what bare nature would be without this infusion of spirit she gives the following

description of a scene in England, but which might be upon Saturn or some other planet which the eyes of man have never consecrated with human comprehension. Looking over Harmouth Valley,

"they stood in clear air above the fog. It had come rolling in from the South, submerging the cliffs and the town and the valley, and now it lay cold and smooth and blue-white like the sea under a winter sky! They might have been looking down upon some mysterious world made before man. No land was to be seen save the tops of hills lashed by the torn edges of the mist. Westward across the bay the peaks of the cliffs showed like a low, flat coast, a dull purplish line tormented by a livid surf. The flooded valley had become an arm of that vague sea. And from under the fog, immeasurably far below, there came the muffled sound of the mother sea, as if it were beating on the invisible floor of the world."

Nothing more remote or indifferent to life and spirit can be imagined. Meanwhile, Mrs. Humphry Ward's new novel, "The Marriage of William Ashe," affords a striking example of the humanistic element in descriptions of natural scenery. "The April country slipped past him like some blanched face to which life and color are returning." The comparison is suggestive, but it is not healthily suggestive. The earth never is sick. It is the province of art not only to suggest, but to bring the proper ideas into perspective. And no matter how cleverly it is done, there is an artistic unrighteousness in relating foreign impressions to one another.

In this country our natural scenery is new. It has not been incorporated intimately or accurately in our fiction. There is none in novels of modern Southern life, if we except Will Harben, who is a romantic surveyor of rural neighborhood scenery. This is accounted for by the fact that writers of fiction in that region are still engaged in describing our *ante-bellum* plantations and the family plate we lost during the Civil War. Occasionally, to be sure, the scene is laid in the present time, but the heroine in that case is born in an ancestral mansion and remains there until she runs away to get married. But if a tree has been planted or a house built in the South since 1865 that was fit for the star character to live in, there is no record

of it in Southern novels. In the Eastern fiction the scenery is nearly all urban, industrial, artificial or architectural. A few years ago Sarah Orme Jewett, Mary Wilkins and Alice Brown used to lay the scenes of their stories in remote country places, and they got natural sunshine and weather into them. But now they have all come to town with their *dramatis personæ*, and these never get further from the city than some millionaire's country residence. They see the country from the front seat in a motor car, but they no more belong to it than canary birds belong to the Northern forests. The heroine remains in a drawing room, or in a factory, except when she goes on an automobile excursion across the country, or takes a picnic on the "fresh air fund." The hero belongs to his club or to the Stock Exchange or to a labor union.

Meanwhile, that part of the West which is composed simply of earth and sky, with neither hills nor forests to vary the huge monotony of the landscape, inspires the best written descriptions of scenery that appear in American fiction. It is a world full of sunlight, silence and distant sky line suggestions. The novelists out there have never come indoors with their heroes and heroines. It is life in the open and love in the saddle with them. They are in the midst of a bigness and they impart refreshing impressions to the reader of their sensations. "At the Edge of the Yellow Sky" is a foolish little story just published which does not offer a single original combination in love or life, but it is

a delightful book because of the long perspectives which the author commands across the marvelous prairie world.

The literary style of the average modern novel is more accurate, closer fitted to the theme, than that of the average story fifty years ago. But one thing we have lost the art of expressing, and that is innocency. Virtue is sophisticated, honor is always a trial, and even the good are bad inside. And again the question recurs, if this pulse thread of reviving spirituality lasts where will the tortured, fevered body of the art begin to mend? Will some one write a book in which the heroine holds together like a real normal personality, even in the privacy of her own room, a woman who will not kneel beside her window sill and carry on so that the reader feels that her sickly soul has crawled out of her and lies like a little white fib in the moonlight? It does not help matters any to let down the hair of such a woman and show how beautiful she is with it falling over her shoulders. We know instinctively that there is something wrong with her, that she is not the best. And it would be a great improvement if we could have a dull man for the hero, who was not especially good but who really possessed two or three hard-headed principles of righteousness. The reason the average reader does not find such characters interesting is because no one with sufficient ability will attempt to portray them in fiction. We seek the poster type because we have all the indelicacies of the poster imagination.

NASHVILLE, TENN.

# American and Filipino Women

BY MARIA GUADALUPE GUTIERREZ QUINTERO DE JOSEPH

[The following contribution was written primarily for publication in *El Renacimiento*, a Filipino newspaper of Manila, by a young Filipino woman who during the past year was connected with the Philippine exhibit at St. Louis. Aside from its discussion of the "sphere of women" from a Spanish-Filipino point of view, it is interesting as showing that the Filipinos can pick flaws in us as well as we in them. In connection with some of the harsher expressions about American women it should be borne in mind that the writer would doubtless tone her criticisms somewhat if writing directly for an American audience, and also that she appears to have had a limited view of American women and, one must conclude, has been unduly influenced by some of a certain type whom she has seen in St. Louis. Perhaps also the joke columns and some of the sensational features of a certain kind of newspaper that flourishes in the United States have misled the writer with regard to American social conditions.—EDITOR.]

WHEN the chrysalis breaks the prison that during so long a time has held it, there are in the nature now flooded by the light of the sun of springtime explosions of joy, which, uniting in concert, intone a hymn to life and love. And when a people which from very remote ages has lived a latent life, growing powerful wings to plow, in the flight of a giant, the joyous skies of civilization and progress, spreads those wings in the attitude of lifting itself in flight, ought not the other peoples, themselves butterflies which some time before have flown upward, to salute with joy their new and graceful companion, who for a longer time was held prisoner in the shades of austere mysticism and who is therefore more eager to see the sun from near at hand?

Such is the dreamer-nation that opens its eyes to the light and its brain to the life of intelligence at the present historic moment. The Philippines rises from its lethargic sleep of centuries.

It suffices to cast a glance at the newspapers of the country to be convinced that the sap accumulating during so long a time overflows now into a splendid flowering of noble and vigorous ideas of humanity and progress. And the consciousnesses held subject, prisoners in the gloomy dungeons wherein the friars confined them, shake off the atrophy into which three centuries and a half of obscurantism had plunged them and begin to discern the radiance of the new idea, a redeeming idea, the symbol of future felicity.

The thinking minds of the country

have comprehended and have inculcated in the mind of the people the idea that advancement of peoples in greatness depends upon the education and cultivation of the feminine element, which, if formerly the obstacle to progress on account of its blindness, will in a short time be the element that, bearing on the victorious standard of civilization, will bequeath the prize of civilization to its children for the benefit of future generations.

The American people, which now plants its feet insecurely on Oriental soil, perhaps only for a short time, will wish to make of our women faithful likenesses of its daughters, hybrid beings with all the defects and weaknesses of woman, without any of her delicate qualities, but with many others peculiar to man, who only aspires to an egoistic end. And our woman, timid and a dreamer, accustomed to the semi-obscurity of the temples, and to see her ideal through thick clouds of incense, is still very tender and very much a being of submission to pass at one blow from the temple to the parliament, to exchange the sewing room for the office, and her graceful and undulant feminine garb for the short skirt that is anything but esthetic, and the collars and cuffs that so well befit the features unlit by smiles of the American women. No, the Filipino woman is still very delicate for this ill-befitting and violent as well as unjust change. There are those who maintain that woman, constituted like man, has the same rights and, finally, is destined to the same labors. Admitting this, which is incontrovertible in principle, yet practical life

demonstrates daily the contrary, to be necessary, to which of the two should be intrusted the labors of a delicate sort, the fantastic productions of the needle, the sweetnesses and tendernesses of the home? Either these last must be eliminated from human life, and we must make of all peoples an American people, among whom the children take care of themselves and grow up without affection or die most frequently in their tender years, burned, asphyxiated and even poisoned, while the mother goes to the shop, the factory or the office, or, merely impelled by her adventure-seeking character, sallies forth into the street to enjoy, under one pretext or another, the rights which have been conceded to her equally with man; or else the day will have to come—as has already occurred in America—when the man or the woman indifferently, according to his or her taste, takes up the delicate labors and the care of the home.

Will it not be more fitting to make of woman a practical, useful and intelligent being, developing in her, along with her intelligence, her heart, making her adapted to the physiological tasks for which nature has destined her and to the moral responsibility to which her position with reference to her children holds her subject? For it is not the father, as we in the Latin countries have wrongly understood, to whom the education of the children is intrusted, but the mother. She, according to nature, is more intimately bound to the child; it is she who first inculcates in him her ideas and transmits to his ductile and sensitive young soul her own impressions and sentiments, even without being aware of it. Why, then, not prepare her so that in place of thrusting herself forth into life in search of the dollar she may continue her educative work upon the future citizen, upon the society of the future? It often occurs in our countries that when the child emerges from the stage of early infancy the father thinks he ought now to go to school. Here arises the first struggle, the mother oftentimes opposing, while the child, accustomed to find

in her an easy compliance to all his caprices and a being ready to sacrifice herself foolishly for him, meets with the first contradictions to his will, and unconsciously sets up a comparison between his mother and his master, to her disadvantage. This brings the relaxation of domestic discipline, with the consciousness on the part of the child that the mother does not count intellectually as of much force; the father stands at one side by himself, unknown, hardly ever seen and much feared by the child, and the mother is a useless martyr, upon whom weighs the tacit disregard of the father and the children. This is the Latin woman, a poor creature overborne by her own abnegation and joyless, born to suffer and involuntarily to hinder civilization. But, on the other hand, the opposing type is not the one to be taken for a model, but rather one made up from an advantageous mixture of Latinism and Saxonism, which will produce not the ideal being born to languish, covered with luxuries, in the harem, nor the delicate type, the nun of marble pallor, nor much less the coarse being with blowsy face and felt hat, who leaves every morning on the seven o'clock train to attend to business in an office, but instead a type—ideal, yes; but not yet perceived—of woman, strong physically and morally, well instructed, intelligent, full of faith in the future, who, balancing the heart and the head, shall fulfil her educative and redemptive mission and shall be equal to man, but without invading his territory—equal in the fulfilment of her mission as the air and the plant alike fulfil their missions, the former to nourish the latter, and the latter to purify the former. This is what they plan to make the Filipino woman, an achievement which, once accomplished, will make powerful and great the Filipino people, who, finally, fulfilling an unescapable law of social biology, will at last take a seat long vacant at the banquet of the sovereign peoples.

Thee, beautiful butterfly of the Oriental skies, my native land, eagle of America, I salute!

MANILLA, P. I.

# Impressions of the United States

BY S. ARTIAGA

[This article and the preceding will give our readers a very good idea of how our people and customs impress two intelligent Filipinos. Mr. Artiaga is a student at the University of Michigan. —EDITOR.]

TO start with, I find it very hard to put in writing my impressions of American life. Coming over to the United States with no worth while knowledge of this country but the meager information I obtained from two or three Spanish books printed back in the seventies, I received countless impressions as soon as I set foot on American soil.

Before leaving the Philippine Islands, in the summer of 1900, I knew the United States was a very large country, but I did not know it was as large as I realized after riding four and a half continuous days from San Francisco, and went only as far as Ann Arbor, Mich.

It struck me the railroad facilities in the United States are something like marvelous. How different from the slow moving water-buffalo we used in the Islands! And the people, too, travel a great deal, and they do it as fast as possible. A friend of mine remarked to me: "These people seem to have solved the equation of motion, discarding entirely the element of time."

In the University of Michigan there is what is termed coeducation. I always believed in the capability of woman, yet I considered at first that coeducation is an unfortunate state of affairs. I pity a girl whenever I see one studying day and night. I changed my opinion, however, when I knew later that the question involved in coeducation is a battle for life. The women in this country have to compete against the men in order to live, and therefore they should be given the same training as men. Fortunately, in my country there is no such competition, and we believe that the superiority of woman lies in her weakness; as a result we have very few old maids.

In Europe, I have been told, there are students who go to colleges to be "students." I have not seen an instance of such here. An American student does

his work conscientiously. He is in a hurry to prepare himself to make his living, and has no time to lose in foolishness. During my first year I wondered how a freshman dared to call himself a '04 student and what reasons assured him that he was going to graduate after four years of schooling. I find an American student has a confidence in himself that he will be able to do well his work and that confidence carries him to success.

I am attending the University of Michigan, and tho it may seem a digression, I shall state that I am proud to have come to this university, the memory of which will always be dear to my heart.

The University of Michigan, besides enjoying the just title of being one of the best universities in the Union, is also very famous for her athletic achievements. For this reason I like to say a few words concerning the game of football.

I noticed last winter that I have already caught the football fever and enjoyed to see a football game. I certainly understood it better—just as much as anybody. But at first I was simply horrified. I suppose any one in seeing the game for the first time felt the same sensation I had. I thought it was worse than a bullfight. I must say that I did not like and only saw one bullfight, for it is to be remembered that the Spaniards failed to acclimate this sport in the Philippine Islands. When I first went to a football game I told those who asked me how I liked it that I would rather see a war, provided it is conducted in a civilized fashion, rather than a game of football, in which two groups of men butt and clash savagely against each other, as they are trained to do, to be later piled in a heap of human flesh with entangled legs kicking up in the air. I considered it a marvel that they were not all hurt.

As it has been remarked above, I

learned how to enjoy a football game. I even admired the skill or strategy displayed by the football players to execute a play and their gentlemanly conduct toward their opponents. These two reasons, I think, made me change my feeling.

But there is one thing I condemn in athletics as practiced in the University of Michigan—a practice that, I am told, is not allowed in some Eastern universities—and that is the gate admission. It cannot be affirmed that the gate admission is for the purpose of supporting the athletic association, for whenever there is a big game, say a championship one, or whenever the management is sure of a big crowd, the gate admission is higher. Such policy seems that of an unscrupulous business man. Means should be studied so that the students would be admitted gratis to all athletic games that their alma mater takes a part, and charge gate admission only to non-students.

Many things in the United States are done on a big scale; in fact, the people of this country sacrifice beauty for bigness. Look at the big buildings; they are big, but without any vestige of architectural beauty; and so with other things.

Some might have taken me for a pessimist. I am far from being so. I shall say emphatically that I believe the United States has almost a perfect school system. I do not mean that there is a uniform school system; there are many; what I want to say is that any man in this country has all the best opportunities for getting an education, no matter whether he be poor or rich. Many poor men make their way through college, and many students wait on table, do washing and other menial labor that in some other places would be considered a disgraceful occupation for a student. Here those poor students are as well treated as the "frat." students.

The facilities afforded by the University itself are worthy of the very best commendation. The like of the library of the University of Michigan, tho this is not the best in the country, I have never seen before. The University has also many laboratories, and, speaking of them, they show the observer the real American—that is, an American is a practical man. He will rather learn a

thing by seeing and doing it than spending his time in discussing why it should be done in this or that way, and in learning how to do it. He prefers practice to theory. And here there is a laboratory for almost everything. In some schools in the United States they even have laboratories for mathematics.

There is one thing in the classroom that has always attracted my attention, the large number of side boards—in fact, the walling of some classrooms is all blackboards. As a result the teacher can send to the board and quiz the whole class at the same time. Such arrangement is very comfortable for the teacher; it certainly saves time, and time is the element most valued in the American life. In the schools at home only one student can be sent to the side board at a time; thus the system is uncomfortable to the teacher and embarrassing to the student, for the whole class watches his work.

In preparing this article I wrote to other Filipino students attending some other universities asking them for their impressions of American life. I like to obtain in that way a very comprehensive view. All were courteous enough to write to me. There is one letter from my good friend Mr. B., which brings some rather very interesting observations. I give part of the letter below:

"In California, due to my Asiatic face, and consequently a certain likeness with Chinese and Japanese, I was always taken for an Asiatic. I was a subject of despise, and wherever I went I was received with words of contempt. This shows the great racial prejudice that exists in this country, and the hatred with which the mass of the people regard any race that is not white or Caucasian, but in many cases this so contemptible a treatment and consideration that any race which is not white is an inferior one are partly diminished when they learn that they are treating with a Filipino student. After one meets persons from whom, due to their utter ignorance of the political and social standing of the Filipinos, and perhaps due to their intense contempt to a race they call an inferior one, one does not receive a pleasant treatment, or, at least, that accorded 'under the same footing.'"

Mr. B. says further:

"I believe, speaking in general terms, the moral of American people is higher than the Spanish's. America is the land of liberty;

her inhabitants are free-loving people; their civilization, moral and social education are very satisfactory if not perfect, but all this is true only when applied to the white race."

Mr. B.'s experience disagrees entirely with mine. I have been a recipient of repeated marks of friendship from the President of the University of Michigan. I have been invited to dinner by some of my professors. I have a lawyer friend who at one time acted as chairman of a State Republican meeting in Detroit, and I am a friend of the President of the Water Board Commissioners of the city of Detroit, Mich., to say nothing of some other acquaintances I have made.

As for my schoolmates they have all behaved very gentlemanly toward me. I was the treasurer of my class in my junior year. I am a senior engineer now and a member of its social committee this year.

If I had not been regarded on the same footing I would certainly receive no such treatment as I have just outlined. It seems to me I am more fortunate than Mr. B. in this matter. Doubtless I have not pleased all Americans I have met, but it is also true that I cannot boast that all Filipinos whom I had intercourse with became my friends.

Speaking in general, the American people are not as hospitable as the Filipinos; but in connection with this I shall add that I do not believe there are any people on earth who can be compared in being hospitable to the Philippine people.

The American people, it seems to me, pay very little attention to social usages. I have found, tho the people of this country do a great deal of reading, that very few have any idea that there are

published standard books on etiquet. One day a friend of mine went to D., where I knew a certain person, Mr. M. I gave my friend an introduction card for Mr. M., whom my friend did not find in his house. My friend left my card, after assuring himself that it would be received by Mr. M. I have no doubt whatever that Mr. M. is a very highly educated person; still he never acknowledged the receipt of my card, as he should have done. At this moment I recall what a friend of mine, Mr. V., wrote me in answer to my request of informing me about his impressions in America. He says: "I was sent to this country to be acquainted with American ways, yet I must confess we (Filipinos) have nothing to learn from the people of this country concerning good manners." Of course every rule has its exception, and it must be understood that I speak in general terms.

Let me touch now the point referred to by Mr. B., and what I am going to say is an emphatic answer to those Americans who have said "The Filipinos belong to an inferior race," or a similar expression. At present the Filipinos are inferior to the American people in many respects, such as in education, knowledge of one's rights, etc., but if they mean that the Filipinos are an inferior race because of lack of capability, I shall challenge their statement. Put under the same conditions, the Filipinos will show to have the same power of development as the Americans. As a student I shall say that I have met in school no American student compared with whom a Filipino has really an inferior mental ability.

ANN ARBOR, MICH.

# As to Preliminaries

BY THE REV. CHARLES M. SHELDON

AUTHOR OF "IN HIS STEPS," ETC.

I WAS invited by the pastor of the Marble Square Church in the city of B—— to preach for him one Sunday morning, and accepted with pleasure because of his cordial invitation and the opportunity of facing an audience of intelligent, refined people, many of whom had expressed kind wishes individually.

The service was advertised to begin at 11 o'clock. The organ began playing exactly on the hour, and as I entered the pulpit with the pastor the church was about half full and people still coming in. As I sat down the pastor handed me the printed order of service for the day, and as I sat waiting for the organ to finish the voluntary I read over the following, which was the service for the morning:

Organ Voluntary.  
Doxology.  
Responsive Reading.  
Solo ("As Pants the Hart").  
Notices.  
Quartet, Anthem ("Consider the Lilies").  
Offering.  
Solo during the offering ("Ave Maria").  
Offertory Prayer.  
Organ Response.  
Hymn.  
Scripture.  
Chorus and Organ ("The Heavens Are Telling").  
Hymn.  
Prayer.  
Organ and Quartet ("Who Are These in Bright Array?").  
Sermon.  
Hymn.  
Benediction.  
Organ Postlude (March by Guilmant).

As I said, it was 11 o'clock when we entered the pulpit. The clock was directly opposite the pulpit under the gallery. As the service proceeded I found my interest just about equally divided between the printed order of service and the hands of this clock. People were still coming in and the organ continued playing until ten minutes after eleven. I

may say here, by way of parenthesis, that people continued to come into the church as late as the Organ Response after the Offertory Prayer. The Doxology and Responsive Reading occupied six minutes, the Solo four minutes, the Notices five minutes. "Why is it necessary," I asked myself at the time, and have asked it many times since, "for ministers to repeat every notice they give, sometimes three or four times? Why is it necessary to urge people to come to prayer meeting or urge them to 'cordially attend' this or that social gathering?" "You are 'earnestly urged' to be present." Why do we want people in our church services who have to be "earnestly urged" to come? The Anthem by the Quartet occupied four minutes and a half. There was no possible connection, by the way, between the Consideration of the Lilies and anything which I had to say, which was as far from the lilies as homiletics is from agriculture. To take the offering required ten minutes by the clock. The Solo during the offering was a beautiful rendering of "Ave Maria," altho why people should sing "Ave Maria" in orthodox Congregational churches is a mystery to me. The Offertory Prayer was one minute long, the Organ Response after it four minutes. The Hymn was read by the pastor. Why should the pastor read the hymns in a church service, seeing the congregation is going to sing them? The whole occupied six minutes, the reading of the Scripture three minutes. They were hurried through as if they were not very important. The Chorus and the Organ took the floor and occupied it for seven minutes and a half. "The Heavens Are Telling" is a beautiful anthem, but there was no connection between the anthem and the sermon which I had brought. What is called the Long Prayer occupied six minutes. Very few ministers can pray six minutes to advantage. The Organ and the Quartet

rendered ("rendered" is the word) a selection, the words of which I did not catch, but the hands of the clock said the performance cost four minutes. Any one who is good at arithmetic can now count up the amount of time used for the Preliminaries—just seventy-five minutes. At the end of all this time I was expected to bring a message of life to a people who were evidently thoroughly exhausted. I cut down and pruned away and hurried through out of compassion for the multitude and said what I could in fifteen minutes. Seventy-five minutes for Preliminaries! Fifteen minutes for Sermon!

This is not exaggerated. The particular instance I have in mind may possibly have exceeded the limits of most church orders of service, but I am reminded of a recent paragraph in one of our denominational papers to the effect that during the recent visit of a distinguished evangelist to this country his message has practically been ruined, so far as its effect upon the people is concerned, by the insufferably long and tedious preliminary exercises, emphasizing the organ and the special music because a large crowd was expected to be present, giving the organist, the quartet and the soloist an unusual opportunity. Here in the raw West, where we have not yet become used to the esthetics of worship, we still consider the sermon to be the main thing in a church service. I would like to suggest, as one who still clings to this old-fashioned idea, that one reason why a good many churches, especially

down East, are devoid of interest to large numbers of people, especially men, is because the service is so tiresome with preliminaries that the angel Gabriel himself could not wake up an audience or do it any good by the time the sermon is reached. I would also like to suggest to some of my long-suffering brethren in the East, who do not dare interfere with the organist and his program, that they might turn their orders of service around some Sunday. Beginning with the organ, have a hymn, and then plunge *in medias res* into the sermon, and let the devil take the hindmost, as he already does now the foremost, of a good many of our orders of service. We have all heard of the man who was afraid to be a Christian because he dreaded the process of being converted. But in many churches we are killing the sermon out of existence because of the tedious process which leads up to it.

These few remarks are modestly suggested by one who has sometimes suffered at the hands of the Committee, but never so keenly as at the hands of the "Order of Service" and the "Preliminaries." My sympathy, however, goes out most deeply to my friend, the pastor of the Marble Square Church. He is a good and brave man, but he is in the clutch of custom and he is going the way of a host of suffering ministers over whom every Sunday the Order of Service waves its black plumes and the Organ wails out the Requiem of the Preliminaries.

## Twilight

BY THEOPHILUS BOLDEN STEWARD

The thousand-warrior of the day  
 Stole starry-tinted from the Earth;  
 But tip-toe on Sierra's hight  
 He paused to woo the coming Night  
 And with a parting kiss gave birth  
 To Earth's delight,  
 Rest-sweet Twilight.

## The Mysteries of Personality

SOME six years ago Dr. Boris Sidis, one of the first to apply to pathological inquiry in this country the experimental methods which in France had been productive of remarkable results, published a little book, the "Psychology of Suggestion," wherein he outlined a theory of the nature of the human mind based on the physiological theory of retraction of the processes of the brain cells. In his recently issued *Multiple Personality*\* he makes an exhaustive survey and re-statement of his position, formulating an original view of personality and bravely attempting to shift the base of psychology in accordance with his contention that multiple consciousness is the law and not the exception of mental life. The lay reader will do well to make the acquaintance of the earlier work if he would correctly appreciate the position here maintained. The argument hinges on the relativity of individuality and on the general tendency of evolution "from structure to function, from bondage to freedom of the individual elements." Opening with an examination of organic structure, and summarizing the results of modern biological inquiry, the author finds a multiple individuality which becomes "more emphasized, more clearly defined as we ascend in the scale of evolution." Passing from the physiological to the psychological side, he discerns an analogy so marked as to lead him to adopt the view that the individual mind is really a synthesized complex of many minds, that personality is a complex of many systems of what he terms "moments-consciousness," and that the phenomena of so-called secondary and multiple personality, usually regarded as freaks of the consciousness, are actually manifestations of the very constitution of the mental life, the dissociations lying at the root

of these phenomena being due to the disaggregation of cell clusters under the influence of strong, injurious stimuli.

To prove that it is well based Dr. Sidis devotes a large part of the subject matter of his present monograph to an account of the methods adopted and the results obtained by him through application of his theory to pathological practice. Undoubtedly the most important case discussed is that of the Rev. Thomas C. Hanna, of Plantsville, Conn., a case unique in the annals of multiple personality. As the result of a fall Mr. Hanna experienced total amnesia, not only losing all knowledge acquired from the date of his birth to the time of his accident, but knowing nothing of his own personality, lacking the power of voluntary activity, and having absolutely no idea of an external world. From the unconsciousness caused by the fall he emerged like one newly born. Talking, writing, walking were beyond his powers. After an examination in which he discovered no signs of organic lesion, Dr. Goodhart referred the case to Dr. Sidis, and together they sought to effect a cure. Their first intimation that Mr. Hanna's primary personality had not forever vanished came when they discovered that in his dreams he relived experiences occurring before the accident. By a process which he calls hypnoidization Dr. Sidis stimulated the primary personality into activity, until at last there developed periods of alternating personality, through which Mr. Hanna gradually became acquainted with his two "egos." Finally, there came a day when the two personalities, so to speak, confronted each other in his consciousness, and out of the mental struggle that followed was formed a fusion personality that has persisted ever since.

It is a peculiar fact that investigators of "manifestations" stumble upon many cases of seemingly secondary personality. Of this Dr. Sidis has much to say, instancing crystal gazing, shell hearing and automatic speaking and writing as

\* **MULTIPLE PERSONALITY: AN EXPERIMENTAL INVESTIGATION INTO THE NATURE OF HUMAN INDIVIDUALITY.** By Boris Sidis and Simon P. Goodhart. New York: D. Appleton & Co. \$2.50.

types of psychic phenomena in which secondary personality may be observed in most active play, objectifying for the waking consciousness, in auditory or visual hallucinations, psychic states originally received subconsciously. Here, needless to add, Dr. Sidis finds corroboratory evidence in support of his view that multiple consciousness is the law, not the exception.

### The Quakeress

MAX ADELER has written one of the best novels of the season, the story of a young Quakeress,\* full of gravity, sweetness and wisdom. The customs of the Friends, their "meetings" at old Plymouth Church, and the charming simplicity of the Quaker character are all admirably portrayed. But here ends the veracious part of the story, and by no means the best part considered from the artistic point of view. Mr. Adler has managed his fallacies with equal grace. These are based upon Southern life in Maryland, just prior to and during the war, or so he imagines. Really they are founded upon the bragging accounts which Southerners themselves sometimes give of this period. It requires a very high degree of mental training to tell the truth about so complicated a thing as Southern civilization before the war. And the Southern man rarely has this training. As a rule, he would rather make the groundlings stare than to stand by a prosaic set of facts, which are more creditable to him. And besides making the groundlings stare, they are somewhat responsible for having excited the literary acumen of numerous Northern novelists, including Sinclair, Mott and Adler. They have accepted these swaggering representations as historical, where as many of them are bold traditions and others notable exceptions to the general rule. Thus, it was not conventional in the South to furnish the negro field hands with liquor, nor for a young Southern girl to slap her black maid upon the slightest provocation, nor for a young man to marry a wife secretly and then return home to court every girl

in the community, including the pretty Quakeress herself.

Dolly Clayton, the girl who flirts with George Fortherly, is not a type of the Southern women. Some maidens have within them the diathesis of the scarlet women from the beginning. They may never actually fall into dishonor, but by nature their feet take hold upon hell. Their peculiarity is that they tempt good men by preference, just as Dolly tempted Fortherly, because it is the unattainable good which fascinates their diseased souls, and which their very touch contaminates. Nothing more gallantly Christian was ever said to such a woman than the young Quaker preacher said to Dolly after she won a caress from him:

"My best wish for thee is that thee shall be angelic in thy inmost soul where thee touches the spirit of the world. God forgive me that I kissed thy hand a while ago. God help thee, and help me, also, lest when I have preached to others I myself should become a castaway. The fear of that is always with me. It was my duty not to be flippant with thee, or to have dalliance with thee, but to hear the voice of the Master saying, 'She is mine. I gave myself for her.' That is it. I must reverence thee and look at thee from afar, because thee is His trophy. Thee is bought with a price."

The profession of a humorist consists for the most part in giving a ludicrous twist to all our frailties and perversities, so that these things which should call for compassion, command a smile, a titter, a guffaw. And there is no habit of the mind more difficult to overcome. This book is remarkable because it is not viciously witty, altho it comes from the pen of a professional wit. There is some caricaturing of church foibles in too many lovable old people, and for the rest he presents his characters with the lights and shadows of a kindly mind to interpret them.

### Swinburne

THIS, the first collected edition of Mr. Swinburne's poetry,\* is mean in appearance and general effect and is quite unworthy of the subject. In substance it differs from the cumulative reprints most

\* *THE QUAKERESS*. By Max Adler (Charles Heber Clark). Philadelphia: The John Winston Co. \$1.50.

\* *THE POEMS OF ALGERNON CHARLES SWINBURNE*. New York: Harper & Bros. 6 volumes. \$12.00.

conspicuously by the addition of a Dedictory Epistle to Mr. Watts-Dunton, which makes perhaps as interesting, tho by no means so critical, a commentary on the poet's activity as could well be desired. Mr. Swinburne's poetry is so familiar by this time that an elaborate attempt to characterize it might seem otiose. But there is one reflection too importunate to be dismissed when his work is surveyed in bulk in this manner.

Whether Mr. Swinburne is solely responsible or not, it is impossible to ignore the fact that his work does serve at least to date an era in the manner of conceiving poetry. Before his day a poem was generally regarded, like a building, as something organized or constructed out of a mass of diverse and heterogeneous material. The analogies used with regard to it were mostly drawn from architecture or at least from the plastic arts. The outline, the plan, the articulation of parts was all in all. And when the poem was judged it was judged as a whole, as a temple or a cathedral might be, with reference to its adaptation. But nowadays who ever thinks of speaking of the architectonics of a poem or referring to its structural adjustments. The arts from which our parallels are now derived are musical and pictorial. The hybrid compounds, *word painting* and *tone color*, so profusely used in a certain sort of criticism, are thoroughly indicative of the change. The poet is now esteemed for his melodic and illustrative powers; his poem, for its picturesqueness, its splashes of vivid description, its glittering little figures and images, and for the variety, ingenuity and intensity of its rhythmical and verbal effects. Or if it is thought of as a composition at all, it is thought of like a patch-work or mosaic of brilliant colors or like a sonata, a combination of phrases and movements.

And the difference is not so superficial as it might at first seem, for it answers after all to an actual transformation in the character of poetry. It is obvious that the powers required in this conception and the carrying out of a broad design are mainly intellectual, whereas those required in the making of pictorial and rhythmic phrases are mainly emotional. For one to describe well

or to versify well he need have only vivid sensations. But that one may plan well he must have the intellectual ability to conceive an idea and the mental intensity to realize it. We should, therefore, expect such a change as has just been described to be accompanied with a gradual decline of ideas and a gradual increase of "sound and fury." And the best single evidence, perhaps, that such has been the recent course of poetic development is afforded by these volumes of Mr. Swinburne's.

**On the Firing Line.** By Anna Chapin Ray and Hamilton Brock Fuller. Boston: Little, Brown & Co. \$1.50.

South Africa has been seen from the Boer side in most romances of the recent war. The authors of *On the Firing Line* take for their hero a young Canadian of birth and breeding, who dons the khaki as a trooper and sees both war and Cape Colony through unaccustomed eyes. A golden-haired English girl is much more disturbing to his peace of mind than the Mauser bullets to his health of body. His experience includes hospital, tent, war among the kopjes—"so-called because every flat hilltop is an exact copy of all the rest"—broncho breaking on the wide khaki colored veldt, and there is movement and life on every page. Two manly men in love with the same girl and without a spark of ignoble jealousy in the heart of either lift the story into a pure clean atmosphere.

**How to Know the Starry Heavens.** By Edward Irving. Illustrated. New York: The Frederick A. Stokes Co. \$2.00.

**Astronomy for Amateurs.** By Camille Flammarion. Authorized translation by Frances A. Welby. Illustrated. New York: D. Appleton & Co. \$1.50 net.

Astronomy, even in its more abstruse phases, is made simple and intelligible to the most unlettered intellect by Mr. Irving. He makes use of many pictorial and diagrammatic illustrations, but he also employs a flood of verbal illustrations. For the mind that cannot grasp the concept of interplanetary distances and the relative size of the planets there is the familiar illustration of a nine-foot globe representing the sun; a large pea, 127 yards distant, representing Mercury; a

one-inch ball, 235 yards distant, representing Venus, and so on to the five-inch globe, five and one-half miles distant, representing Neptune. This method is freely employed and with excellent effect throughout the book in visualizing to the reader the general data of astronomy, such as star distances, volumes, masses and motions. The diction, moreover, is simple and direct. In all respects it is a book admirably adapted for the average reader. Professor Flammarion's volume, which was originally known as "Astronomy for Women," has an introductory chapter on the contributions which women have made to the progress of this science. It is rather rhapsodical in manner, a fault, indeed, characteristic of Flammarion in all of his popular writings, but more pronounced in this than in the others. In a final chapter on "Life, Universal and Eternal," he allows his imagination free rein in speculating upon the eternal problems. The book is unfortunately not free from error. The distances of Vega and Sirius (page 309) are wrongly stated, and to speak of the sun as but "108 times larger than our little planet" (page 315) shows a carelessness in expression out of place in a scientific work.

**The Aftermath of Slavery.** A Study of the Condition and Environment of the American Negro. By William A. Sinclair, A.M., M.D. With an Introduction by Thomas Wentworth Higginson. 12mo, pp. xiii, 358. Boston: Small, Maynard & Co. \$1.50.

This volume is written by one of the race which he considers. The author has made a considerable study of a very large subject, covering not only the institution of slavery and its abolition, but still more, its aftermath. Of this we find most valuable the story of the attempt of the Southern States to restore slavery practically, after the War of the Rebellion, by the "Black Code," which most people have now conveniently forgotten, but which compelled the adoption of the Fourteenth and Fifteenth Amendments, and the reorganization of State Governments by the aid of negro voters. This is a chapter which later historians of the "thesis" type carefully omit or sophisticate, while they exaggerate the evils of the period which readmitted the States,

gave them modern constitutions and educational systems, with no more evils or corruption than might be expected in the abnormal conditions, and no worse than have existed since negro suffrage was practically abolished. The volume contains valuable quotations from Blaine and other writers, and attempts to analyze the present progress of the race. But here we should have liked more figures and fewer generalizations and quotations.

**St. John's Fire.** A Drama. By Hermann Sudermann. Translated from the German by Grace E. Polk. Minneapolis: H. W. Wilson Co.

It is a good thing to have this play in English, for it is one of the best of Sudermann's, but very little known in this country. It was given for the first time on the American stage last winter by Miss Nance O'Neil, who used a translation by Mr. Charles Swikard. Miss Polk's translation reads well, but is not accurate; in fact it contains some absurd misinterpretations. *Alle Wunden verbinden* is not "unbind all wonders," as Miss Polk has it, but *bind up all wounds*. *Das wir sie wieder wegstreichen* is not "we'll run across her again," but *we can get rid of her again*. *Pensionberechtigung* is not "the direction of the Pension Bureau," but *entitled to a pension*. *Abendmahl* as used on p. 45 is not "supper," but *Communion*.

**The Life Worth Living.** By Thomas Dixon, Jr. New York: Doubleday, Page & Co. \$1.20.

This volume is written to prove that life is worth living if a man has a good income, good hunting, good dogs, an agreeable family and a "stately Colonial home on the shores of the Chesapeake Bay." The inference is that otherwise it may not be. Mr. Dixon is his own hero, and there is not so much difference between him and the heroes of his other tales, except in the innocence of his occupations. The illustrations are also by Mr. Dixon and of him, his family and his home, and they do great credit to his choice of a home and a family at least. Now if he could have made the concluding chapter a sort of autobiographical obituary of his own literary career and

promised to devote the rest of his life to killing ducks the long-suffering critics in this country would have been saved a painful and tedious duty.

**A Manual of Corporate Management.** Containing Forms, Directions and Information for the use of Lawyers and Corporation Officials. By Thomas Conyngton. New York: The Ronald Press. \$2.50

Mr. Conyngton's useful handbook is completely described by its title. Any one dealing responsibly with corporation affairs needs practically the information here given. The book is not intended to compass the subject in detail, for that would make a burdensome volume, but its succinct and generally very clear explanations of by-laws, duties of officers, standing of stockholders, requisites of bookkeeping, issue of bonds, commercial paper and the like cover the ground so far as possible short of giving statutes and citing cases, and that would make the book misleading to the average layman.

**A Pilgrimage to Jerusalem.** By Charles Galaudet Trumbull. Philadelphia: The Sunday School Times Co. \$2.50.

This narrative of the new peaceful crusade, the invasion of the Holy Land by the Sunday school workers of the world in 1904, told by the editor of the *Sunday School Times*, will be sure of a good sale. Every one of the 711 who sailed on the "Grosser Kurfürst" will want a copy and several for friends, while merely as a record of travel and observation in Oriental lands, tho in well beaten paths, it will have a wider interest. The numerous snapshots of biblical scenes add to the vividness of the description of this memorable voyage.

**The Ravanel.** By Harris Dickson. Philadelphia: J. B. Lippincott Co. \$1.50.

The scene of this story opens in Mississippi just after the war, but before the reader has time to resign himself to another tale of Reconstruction days the author stretches a sentence across the intervening years and lands with all his characters in 1897. Unfortunately, the book is like an egg with two yolks in it—

it addles rather than hatches. While Mr. Dickson possesses a peculiarly charming literary style and a gift for portraying genial human qualities, he has blundered in the symmetry of his story. With the trial of Stephen Ravanel for the murder of his father's assassin interest reaches the climax. But we are obliged to wander on for another two hundred pages to an anti-climax. The curious thing is that a writer so gifted with ingenuity and the power of portraying innocent, refreshing situations should be so lacking in the sense of artistic proportions.

**The Declaration of Independence.** An Interpretation and an Analysis. By Herbert Friedenwald. New York: The Macmillan Co. \$2.00.

This is the most scholarly study of the Independence campaign that has been made. It is the result of long and continued research and a full acquaintance with all of the literature and original sources. The organization of the Revolutionary forces is outlined in the chapter entitled "The Popular Uprising." The rebellious faction in the colonies was led by conventions, committees and irregular bodies, except in a few cases where the regular assemblies were in control of the revolutionists. This local direction of the movement gave place at last to the leadership of the Continental Congress. In a chapter upon "The Congress Finding Itself" is shown the growth of the Congress from an impotent body with vague powers to one almost absolute in its control. A body deriving all its sanction from local political organs—limited in its authority by the reason and good sense of its constituents—gradually led the colonies to new governmental organization and final independence. The facts submitted clearly show that the Revolution was the work of an active and vigorous minority, which first got control of Congress, and then, by fostering the democratic elements in America, secured the support of the people. The chapter "The Idea of Independence Takes Root and the Congress Prevails" shows how the Independence idea was gotten before the people. In the "Congress and the Democracy" Dr. Friedenwald shows how Congress overthrew the conservatives,

who were fortified behind the old franchise limitations; how it used the Continental Army to strengthen the revolutionary organizations, and how it perfected the system of revolutionary conventions and committees. It is a difficult study, involving a great amount of research. The book is a credit to the author's conscientious scholarship, and, tho written in a rather heavy style, is interesting because of the nature of its subject matter.

**A Grammar of Greek Art.** By Percy Gardner, Litt. D. Lincoln and Merton, Professor of Classical Archæology in the University of Oxford. Pp. xii, 267; 87 illustrations. New York: The Macmillan Co.

Professor Gardner's best work has been done in the study of coins, in which he has long been an acknowledged authority. In the last chapter of the book, entitled "Coins in Relation to History," we have the following example of his methods and results: "When Gelon of Syracuse won in 479 his great victory over the Carthaginians at Himera the defeated city was able to obtain tolerable terms of peace through the intercession of Damarete, wife of Gelon, and in gratitude presented to her a hundred talents of gold. From the proceeds were issued silver coins of the weight of ten Attic drachms. Now we have surviving a few coins of Syracuse of archaic style and of this very unusual size and weight. We can assign them unhesitatingly to 479-8 B. C. Every archeologist will appreciate the advantage of being able to assert that all coins of Syracuse of more archaic style than the Damareteion were struck 479 B. C., and pieces of later style after that date." Another short chapter, entitled "The Life History of a Myth—The Judgment of Paris," shows "that the whole series of representations of that myth is an orderly development, following psychological law, and reflecting in a minute mirror the course of Greek literary and artistic growth and decline." The illustrations are here all taken from vase-paintings. The curious remark (p. 156), "It was like the letting out of water when toward the end of the sixth century the red figured method of vase-painting was introduced." What can be meant by this "letting out of

water"? It sounds like the biblical phrase, Prov. 17: 14; but there it clearly denotes a calamity, which the incoming of the red figured ware certainly was not.

## Pebbles

"I FEAR this will go hard with me," said the egg, as it fell into the boiling water.—*Harvard Lampoon*.

....*Ben*: "I hear that Jim has appendicitis as a result of the Senior Banquet." *Bob*: "Yes, he ate some oysters and forgot to take off the shells."—*Cornell Widow*.

....WAGNER IN KANSAS.—"If 'Parsifal' failed to make much of a hit in Kansas it can doubtless be attributed to the fact that it interfered with the milking and other evening chores."—*The Topeka Capital*.

....DRAWING A CROWD.—"Isn't this an unusually large crowd for a prayer meeting?" asked the visitor. "It is," replied one of the regular attendants; "but the cashier of the Fifteenth National Bank was converted last week, and he promises to 'tell his experiences' to-night."—*Omaha News*.

## DISDAIN.

Said a dapper young darky in 'Frisco,  
"Ma love, ah've a notion to kiss yo'."

She said to him, "Slush,  
Yo' lips ah might crush,  
Yo' chocolate-coated nabisco!"

—*Princeton Tiger*.

....The worship of Venus is now being carried on in New York, along with the worship of Bacchus. A statue of the impure goddess, said to have been made by Praxiteles, has been set up in the Art Museum, and thousands of persons, male and female, go to feast their eyes upon its beauties. The pedestal is every day covered by wreaths and bouquets of flowers. What could pagan idolatry do more but make vows to be wicked before the shrine of the wicked beauty? The New York worshipers do not need to make any vows, probably, on such a matter; it requires no effort of the will to supplement the inclinations of the appetites. Probably some of these votaries of Aphrodite look upon Catholics, as they are taught by some anti-Catholic prints to regard them, as "idolators." THE INDEPENDENT recently gave front and rear views of the wicked beauty, without any apology for the absence of drapery. This is one of the moral instructors which denounce the Filipino Catholics for paying honors to the statue of the Blessed Virgin.—*Catholic Standard and Times*.

## The Heart of the Year

JUNE is a wonderful month in more ways than one. It is the strenuous time, when every drop of Nature's blood is at work creating something beautiful and good. It is the very heart of the year, throbbing and pulsating with life. One must be around in his fruit garden all the time, with knife to nip out superfluous shoots—one inch of a day and night; five inches of a week. Half of this growth is in the wrong place; strength gone to waste. Nature is a careless manager, we think; forgetting sometimes that she is at work on a much broader system than our own. She hardly recognizes the fact as yet that man has been developed, but goes on creating thickets of her trees and bushes to protect the fruit and shelter the wild creatures. In an old cow pasture you will see why this is, for all the apple trees are nibbled off until they make dense thorny shrubs, three or four feet high, and as many feet through—in which a few flowers may possibly appear, but rarely any fruit. If we folk want orchards, Nature requires that we intrude on her system and create them for ourselves. Eden is always a possibility, if you have an Adam and Eve to tend it. They will, however, very quickly be in a wilderness if they are not industrious in tending the garden. They do not need to move into the wilderness; the wilderness just grows up over them.

We come into June imperceptibly. Perhaps it is glorious, not so much for its distinctiveness as for its completeness. If anything defines and differentiates it from the rest of the months, it is cherries, strawberries and roses; three cousins, but so far apart that no natural law would forbid bans if we could only get them to cross over the lines. The cherry in flower and in fruit is the ideal of perfect beauty. The rose is the glory of florescence; the strawberry is the most winning of

fruits, but the two are fairly combined in the exquisite beauty and richness of the cherry tree and its crop. One May Duke cherry tree, or one Governor Wood and one Black Tartarian should stand on every lawn where a beautiful country home is created—and where beautiful birds do congregate. Then comes the contest, a fair and generous one it should be, as to which should get most of the cherries. Wonderful is the strawberry, in spite of its humility. A little finer than the pleasure of eating them is that of walking up and down the rows to compare rival varieties—involving, we allow, some tasting. We linger between Johnson's Early and Texas for earliest—long enough for discretion. Between Wolverton and Lyon there is once more a keen contest—to our advantage. And so it goes, until with Kitty Rice and Commonwealth we have become so fully acquainted that even a strawberry shortcake, old fashioned and home made, loses its attractions. Perhaps it is still finer to walk through a cherry orchard, discussing the qualities of the Biggereaus and Morrellos with the robins and cat birds. Ah, but these fellows on wings have all the advantage—and then they can eat all day and have never heard of dyspepsia.

Then the roses! You always await their opening with a little impatience. They never hurry. The buds seem to say: "Well, we are worth the while, we ourselves; and we cannot be put upon by your fretting. Our toilet is of quite as much importance as yours. Wait till we get a good ready, and then you shall see what you shall see." Each petal must be made absolutely perfect on the loom. Worth cannot begin with the art of the rose in dress-making. The bud each day gives us just one more touch of the exquisite—tipping itself with crimson or gold. It is the grandest poem ever held to the heart of Nature. Yet the bud is not enough—not even when dressed

in mossy lace. You go out at four o'clock of a dewy morning. You wind about among the mock oranges; and even a few of the later lilacs still perfume the air. Red clover sits among the daisies all over the lawn. You note the growing plums and the apples that are just forming on the trees. Robins chirp and scold their young families that hop through the grass. Cat birds greet you with an almost articulate good morning. It is wonderful how our souls can fit into one of these daybreaks. But as you come around the hedge, just where the dewdrops are catching the first sunbeams, you face the big rose bed; and there, high on the top of Hermosa, is the first opened flower. Clotilde Soupert will need only a few more hours to throw open a dozen blooms, and General Jacqueminot is flushing into crimson scarlet a half dozen more. Meteor will be ready to-morrow morning. How beautiful is the thought that Nature never finishes her work and sits down to rest. Something is going on all the time, but most of all in June.

Tulips lingered until the first days of June, and then, anticipating the roses, dropped their petals. It is now time to dig the bulbs for storage. Few ever see tulips as they ought. It was not intended by Nature that they should stand singly or in small groups. One rose will do, but you want tulips by the thousand; and almost any one in the country can have them after this manner. Put them down anywhere. Just push the bulb in three or four inches down, and you will be sure to hear from it. You will never get them all out again, however you may diligently dig. They are perfectly hardy and will multiply like potatoes. They will come up through the sod after twenty years, but they will make no trouble and do no damage.

We ought to have a good deal of sympathy with the birds just now. Their fledglings are everywhere in the grass and in the bushes, or are just tumbling, on new made wings, out of the nests. They are such helpless little fools, and the mother knows so much of the murderous world into

which she has ushered them. Those of us who have tried to create a bird paradise know how difficult it is to shut out all sorts of crime. Crows will fly over the walls, and as for imaginary troubles we may suppose that good bird mothers, like good human mothers, can find them everywhere. So Mrs. Robin has a rather miserable two or three days of it—gets terribly excited and trusts nobody. Cat birds know better, and when they have made a friend they know it and place confidence in him. They will walk around with you and talk about it, bringing their funny little kitten birds with them. Abolish the cat and these brown beauties will come to the door to build, and will eat on your window sill. They know you individually, as no other birds do. They have the best bird sense in our whole catalog of feathered friends. The tanagers are in the apple trees, and the wood thrushes have left the woods to sing on our elms. There is not forest enough left for these fine fellows, so they have been compelled to bring their ringing melody to our dooryards and lawns. It is still fine music, but not quite so fine as when it was heard from the woods, for it lacks the echo among the trees.

Yet, after all, June is rather colorless. It is not cold, nor is it hot. It has not the florescence of May, nor the frutescence of July. Its orchards are no longer dressed in pink and white; they are all busy working out the problems of the year's harvest. Young apples are dismal looking things and tax the imagination to see in them Northern Spys and Spitzenbergs. The plum tree has nothing on it attractive, except promises. The raspberry, however, is beginning to open its welcome for the bees, and the hives are being stored rapidly with honey. It is not only the business month of the year, but one of the brainiest months. Will you look at a General Jack Rose and think over the amount of brain work that has gone into its making? It is enough to make a Christian of anybody. Here is not a mere evolution, but a combination

of evolutions; combining, correlating and harmonizing color, shape, fragrance into something that we can easily allow to be the thought of a God. Is this the old argument of Paley in a merely modified form? Yet all the same you cannot think out a rose without intelligence, and we beg leave to say that we do not feel or see anything more surely this June morning than Universal Purpose.

## A Ring's Victims in the Graveyards

IT is to the graveyards of Philadelphia that one must go for the most enduring and pathetic proofs of the Durham ring's heartless greed. Abundant proof of the theft of public money is found elsewhere—in corrupt contracts for millions, in the private sale of franchises, the negotiation of gas leases, and all the other acts of the conspirators, who were sustained by almost incredible frauds at the ballot-box. Robbery is bad enough, but murder is worse, and murder is not too harsh a name for the killing of hundreds, possibly thousands, of citizens by the ring's infamous obstruction of the project for purifying Philadelphia's water supply.

Why that project was opposed and why, after a time, the opposition was withdrawn, is shown by last week's disclosures as to the real owners of the great filtration contracts. Upon the new filtration beds the city has already expended \$22,000,000, and two of them are in operation. Contracts for nearly all the work were given to the ring firm of Daniel J. McNichol & Co. On the witness stand Daniel J. McNichol was forced to admit that his interest in the firm was only one-twelfth, and that his partners were Israel W. Durham (the Boss), and State Senator James P. McNichol, the Boss's chief assistant. These are the men who have enjoyed nearly all the profits accruing from contracts (for the filtration beds and other public works) amounting to about \$50,000,000. Durham, formerly one of the late Senator Quay's trusted lieutenants, has been called "the peerless leader." He is the State Superintendent of Insurance. It had not been known outside of the ring

that he was a partner in the McNichol firm.

When this did become known, some recalled the history of his successful attempts to delay the work of purifying the water supply. Some, but not many, recalled it, for an unending succession of shameful and corrupt jobs has dimmed the memory of Philadelphians and their excellent newspapers with respect to this foul transaction, almost unique in the history of municipal crime.

As every one knows, Philadelphia for many years has had a bad eminence in the column of comparative typhoid death-rates. Pollution of the city's water supply has caused a continuous epidemic of typhoid fever. At last the efforts of the press so stimulated public opinion (an epidemic of exceptional virulence prevailing at the time) that the demand for filtration became irresistible, and measures were taken for negotiating a loan of \$12,000,000. The greater part of this money was to be expended upon such filtration beds as have lifted the typhoid curse from many other cities. That was in 1898. At once two obscure ward politicians, their names were Barr and Yocum, appealed to the courts for an injunction to restrain the city officers from raising the money. Having been beaten in this first attempt, they applied to the courts again, a few months later. Hundreds were dying of the fever, and the good people of Philadelphia (who were holding mass meetings to hasten the construction of filtration works) wondered why Barr and Yocum were spending money upon these legal proceedings. In the lower courts these two ward politicians were beaten a second time, but they promptly appealed to the Supreme Court. Some observed that the Mayor then in office was known to be in disagreement with Durham. In 1899 this Mayor's term ended. About two months later Barr and Yocum suffered a final defeat in the court of last resort, and the officers of the city were free to obtain the needed money.

It was then that Israel W. Durham, "the peerless leader," in a public statement declared that the two ward politicians had been his puppets and that he himself had caused this delay of a year. Why? Because, he said, he "did not be-

lieve that the former administration should have the expenditure of so much money." Everybody can see now the real cause of Durham's opposition. He knew that under Mayor Warwick's administration he and his associates could get the filtration contracts only by submitting the lowest responsible bids. But now there was a new Mayor who could be trusted, and it was under this new Mayor that filtration bed contracts amounting to \$17,000,000 were awarded to the firm of Daniel J. McNichol & Co., in which Durham, as the public learned last week, is the leading partner.

While an afflicted people sought relief, while the epidemic death list was growing, while the mourners were going about the streets, this callous wretch strove successfully to prevent the adoption of relief measures until he could be sure of his corrupt profit! And he is still a resident of Philadelphia, strange as it may seem. He also holds a State office for which he receives \$15,000 a year, and he enjoys the intimate friendship, the sympathy and the cordial support of Boies Penrose, one of Pennsylvania's two representatives in the Senate of the United States.

A part of the city's filtration system has been completed and is now in use. In wards where the purified water is supplied there has been a remarkable reduction of the typhoid death-rate. In some of them the disease is now almost unknown. It is reported that in October last, when there were more than 300 cases in the city, not one was to be found in the district to which the filtered water came. This shows how great was the offense of the man who, for the ultimate enrichment of a gang of thieves, prevented for a year the beginning of work on a project that was to save thousands of lives.

No indictment of Philadelphia's ring and its Boss is complete that does not include the mute testimony of the city's graveyards. When this testimony is added to the record of theft, of fraudulent elections, of the debasement of the police, of the corrupt alliance of the ring with the keepers of "white slave" dens, and of all the other wickedness that the recent civic revolt has brought to light, how terrible the indictment is, and how

inexplicable has been Philadelphia's acceptance of the shameful burden of such ring rule for so many years!

## The Wedding

THIS is the month for weddings, which reminds us that a wedding is the one occasion in life where the woman *always* outshines the man. She is the heroine, and there is no hero. The *rôle* of a bridegroom is far from being heroic. As a lover he may have been entitled to some such part, but now he is simply the "booby prize." His very air of triumph is tailor-made, and he is really the most absurd, innocuous looking person in the world. But no matter how obscure, insignificant, the bride was before, in that hour she is the chief potentiality, the object of interest and imagination. Nothing, in fact, is so suited to any young woman's character and temperament as being a bride. And every one knows how becoming it is to her. Whenever the commonplace is crowned with orange blossoms and enveloped in a heavenly mist of white veiling it ceases to be commonplace, and the humblest woman develops then into a poetic figure of feminine personality. She rimes with love and hope and ideality. She wears the satisfied expression of one who has "arrived," a confidence which adds dignity to her stanza. And while she may lose many of her foolish riming qualities later on, she carries that expression through all the troubles and sorrows of her married life. Only married women, indeed, have just that epic look of completeness, altho many maiden ones become graven images of repose.

And after the pageant at the church, after the wedding breakfast, after the bride has changed her bridal white for the "pearl gray" traveling gown, after she has shaken off the last grain of rice, and the groom has put on his natural dogskin gloves—why, after so many elaborate efforts to conceal the fact, does every one in the Pullman car recognize them as bride and groom? In the first place, it is because the bridegroom is too preternaturally accommodating. When a man travels who is in his normal state he is either in a sort of intellectual coma, or he is absorbed in reading, or he is lost

in a conversation. We never see him hanging silently suspended upon the mood of the lady or gentleman beside him. He may be exacting, but he does not look as if everything offered to read or to eat is not near good enough. These are the earmarks, however, of a bridegroom. And all the while the bride is curiously oblivious of his best endeavors, when any other woman would be greatly complimented. That is the first thing which attracts attention. She sits, like a pretty, new saint "riding straight into the gold." She hopes, of course, that no one will recognize them as bride and groom; but that rapt expression of "riding straight into the gold" gives her secret away to every passenger in the coach. The red-faced drummer sees it and smiles cynically; the very news monger comprehends and winks. The women are vaguely embarrassed for some occult reason at the "exhibition" they think she is making of herself. The only one who really sympathizes with her mood is the white haired old scholar across the way who has grown heavenly minded with the rhythm of years and learning. And the only one disconcerted by it is the bridegroom himself, who, if he knows anything, knows that she is *not* riding "straight into the gold," and he is wondering how in the world he can ever make up for the disillusionment. As a matter of fact, he never can, tho he served a thousand years. It is a foolish trance, peculiar to brides, for which no one is responsible and which we shall never understand, since hereafter there will be neither marrying nor giving in marriage.

But the honeymoon would last longer if it were not for the fact that the wedding journey is too great a tax upon the nerves and patience of the *dramatis personæ*. For not even bridal days can change the normal level of human nature. And it will not endure any lengthy period of exaltation, whether religious or romantic, without a carnal reaction. The situation, in brief, is this: All women, and brides in particular, have a taste for angelhood; not because they are better fitted to it than men are, but it appeals to their imagination and satisfies the innocent hypocrisy of feminine nature. Thus a bride will copy the airs of all the angels

in heaven and she will keep it up indefinitely with curious little nervous lapses in conduct, not because she really is an angel, as the bridegroom marvels that she is, but she is putting on what she wishes to be. Meanwhile the young husband cannot long maintain his exalted bridegroom manner, because he has no natural gift for that kind of thing. He is just a mortal man with no instinct for plagiarizing heavenly graces. Besides, he is not accustomed to this romantic, sweetened idleness. He belongs to the region of realities and achievements, and he misses the commercial impetus to his daily life. He despises himself for his depression, but he is depressed. And that is not the worst of it—the bride knows it and considers it a personal affront to herself. In the quiet tolerance of her indignation which follows, however, she eases the situation by shedding many of her bridal perfections. A spark of feminine spite (justified, but spite, nevertheless) creeps into her conversation. The ruthless groom takes courage and dares to show more and more of his more natural qualities. And no one, unless it is a similar occasion with his second wife, ever catches sight again of his supernatural qualities. He remains a kind and faithful husband, but a poetic virtue has gone out of him and leaves the poor bride to weep in secret over her idol's "feet of clay." When they are once more at home, therefore, she is just as pretty, just as enchantingly sweet, but somehow she has receded. There is a poor little bride ghost that walks in her heart and will not be laid. This accounts for her remoteness. Now and then in the pauses of the conversation, when she thinks she will not be noticed, she runs back to keep company for a moment with the sad little ghost. But, of course, she *is* observed, and her friends say, "Mary is changed since her marriage. She is so remote, as if she were talking to us from another sphere!" But Mary's husband is pronounced "just the same old John!" And so he is. His change was brief; he is back for good and always in his world of realities.

If they had remained at home after the wedding, if John had gone to his business as usual every morning and if Mary had pursued the even tenor of her way

in happy anticipation of his return, the *dream* of love would have lasted longer. But it is just as well to have that part of love over with when we think how long the real wedding journey is, lasting from the altar to the grave, through all the inclemencies of life. And when we count the price which love pays for love along the way honeymoon dreams are light and foolish in comparison.

## The Uprising of the Subject Races

THERE are mutterings and more than mutterings of the subject races. There are threats of resistance, rebellion and revenge. We hear them from all over Asia and Africa, and even from the Jews of Europe, who are beginning to find their weapons to resist Russian violence. It is a new thing that they do not quietly submit to be slaughtered, but strike back with blow for blow. In Morocco, with the encouragement of Germany, the Sultan refuses to yield to the requirements of France. In German South Africa the Herreros successfully expel or kill the white garrisons. In British South Africa the great political question is how the rising of Ethiopianism in religion and politics is to be suppressed; for a new spirit of independence has arisen, with a new cry of "Africa for the Africans," while the natives refuse to work in the mines as of old, and Chinese coolies are brought in their place. In Eritrea the Italians were defeated in battle, and in Abyssinia a black Christian king guards jealously his realm against foreign control.

In Asia there are parallel conditions, except that they are more acute. All over the great continent the victory of Japan over Russia delights native pride and awakens large anticipations. Every native paper in India asks how long the millions of India shall be subject to a few thousand British strangers. This is no Sepoy Rebellion; it is a deep and serious question in the hearts of the most intelligent Hindus, asking for equal rights and power of brown and white. We see it in the sharp criticism of the attitude of the Governor-General for his definite expressions of British supremacy,

as if he were less kindly disposed than the benevolent rulers who have preceded him; and in the annual congresses of native scholars and men of wealth demanding larger rights of self rule; and every speech looks to Japan as the leader and example of Asia. We see the same in Afghanistan, where Abdurrahman's son emulates his father's independence, and delays to yield to the demands of the British Commission that visited Cabul.

But especially in China is the new spirit at work, for they are nearer the seat of war, and are most affected by the overwhelming success of their yellow neighbors. China has for centuries looked upon Japan as her inferior; but now Japan has humbled the greatest white empire of the world, and China asks why she cannot do all and more than all that Japan has done. Hence the thousands of Chinese youth sent to Japanese schools. Hence Western education accepted in all the larger towns. Hence the multitude of newspapers everywhere in China preaching a crusade of new development to resist foreign aggression. Like the Sepoy Rebellion the Boxer rising was too early and was misdirected; but another and deeper movement is preparing the way for a self-dependence that will deserve success.

For think of the humiliation that China has suffered from Europe. France has established vast colonies on the Gulf of Tonquin; Germany has seized the port of Shantung and claims influence in the whole province; Great Britain met the Russian capture of Port Arthur by gaining possession of Wei-hai-wei, after already holding Hong-Kong, Canton and Shanghai. Russia had taken nearly the whole of Manchuria, and threatened Korea, which aroused Japan to declare war. If the Chinese are men, with our common human nature, they cannot but resent all this foreign imposition, and it is right that they should look for the time not far off when China shall belong to the Chinese alone.

The occasion for this new uprising of local patriotism is not their fault but ours. We Caucasians have imagined that we, with our white skin, our culture and civilization and religion, are intrin-

sically so superior to black and brown and yellow pagans that we have the right to rule them as we would. We did not know that we are superior not by nature, but because we have arrived a little before them in the race for enlightenment. They are following, and they will equal us. As they begin to equal us they will yield to us no more. That is natural, and that is right everywhere. The only escape from violence and war is in the mitigation of Caucasian insolence and rapacity. European nations will have to leave China one by one, as the Russians are leaving Manchuria, by force if not by consent. Caucasians are slow to believe that "a man's a man for a' that" if he is not of their race; just as it did not occur to those who wrote our Declaration of Independence that it could apply to Indians or negro slaves. But it does, nevertheless, and "a man's a man for a' that" whatever his despised race, and every race has in it the promise and potency of full development.

We Americans are not free from this fault of racial arrogance. It has been cultivated in us by our relation to two subject races in our own territory; and we are now finding that the proud curse of it is coming home to roost. We are learning that our detestable legislation toward our immigrant Chinese is doing us serious damage; for in China American commerce is being boycotted. By administrative order if not by legislation the present vicious laws of exclusion must be modified; they ought to be repealed, and Chinese should be treated just like Italians. It is our superior arrogance toward races that makes the West Indies afraid of annexation. It is that only that gives us difficulty in the Philippines, altho, most fortunately, our Government has rejected the universal policy of Western nations in the East, and is developing self-government everywhere in the Islands. Only as that is continued and developed, until the Philippines shall no longer be colonies but integral States of our Union, can we expect them to continue a part of our territory. That is the policy which THE INDEPENDENT has consistently maintained—no permanent colonies anywhere in the world; everywhere ultimate States of equal rank.

## The Possibility of Governmental Insurance

OF all forms of villainy the systematic robbery of widows and orphans has always been regarded as the most contemptible. The disclosures of the Frick report of the affairs of the Equitable Life Insurance Company represent such a diversion to personal profit of the property belonging to widows and orphans as calls both for the severest censure and for serious consideration of the entire system of life insurance.

It is not our purpose, however, at the present time to moralize upon the morals or the judgment of the private individuals whose transactions have been forced into public notoriety. We wish to call attention to a far more serious and significant aspect of the affair—that is, the demonstration which has been afforded of the inexpediency of leaving the gigantic business which life insurance has become to the exploitation of private enterprise. It will be an astonishing circumstance if out of all the turmoil of recrimination and discussion there does not spring a strong and persistent popular demand for the organization of Government insurance.

With the extinction of small business enterprises through trust competition, and the consequent driving of thousands of once independent business men into the ranks of salary earners, life insurance has become practically the only provision that the average man can make for his family. Great as is his legitimate interest in an economical and efficient system of transportation and communication, in a low cost of gas and electric light, these interests are infinitesimal by comparison with his interest in an honest system of insurance. If public policy requires the municipalization of lighting, heating, transportation and communication, it requires with immeasurably greater reason the public organization of insurance. Private exploitation of gas distribution and street railway traffic filches from the average individual his dimes and nickels. The Frick report in substance amounts to a charge that the private exploitation of life insurance filches from the same average individual

a large proportion of the savings of a lifetime.

If any intelligent person will devote a day to a comparative study of the Frick report and the State reports upon Government insurance in New Zealand he will find himself concluding that the American policyholder gets for his money somewhere far less than he ought to get. Assuming that he is paying \$200 a year for twenty years for a \$5,000 life policy, it would appear that he ought to be getting for that premium a policy of from \$10,000 to \$15,000. This is a bit of practical finance that the most inexpert practical mind should be able to grasp.

There is, moreover, another phase of the problem that is intensely practical in almost an equal degree. Mr. Bryan and his partisans have sought to awaken the American people to a sense of the tyranny of the money power. They have shown a curious inability to perceive just what the money power is. We get very near to the real thing when we discover where the great loanable funds are accumulated and who the men are that handle them. The power that has been wielded by the great life insurance companies in the financial world has been well nigh inconceivable to the simple minded. Under a system of Government insurance the loanable funds that would still accumulate after great reductions in the cost of insurance had been made would be placed by Government officials. Human experience has not thus far shown that Government officials are in themselves more worthy to be trusted than private business men are. The essential superiority of governmental over private financial transactions lies in the necessary publicity of governmental procedure. Were the enormous loanable funds now held by private life insurance companies to be under governmental control a degree of publicity would be introduced into all financial operations that would be revolutionizing.

On all these accounts the American people should bethink themselves whether the time has not come for an active campaign to bring about the establishment of a strong and comprehensive system of governmental life insurance.

## The Smothered Preacher

THE Rev. Mr. Sheldon's experience with superfluous "Preliminaries," which he tells about on another page, reminds us of the predicament of a preacher on Children's Day or Easter when he tries to peer over or between the tall peonies or lilies and dodges nimbly around among the oleanders and palms and manipulates his gestures with care lest he should hit the bouquets of roses. Obviously it is his desire and his duty to kick all the crêpe-paper-covered pots off the platform, but he fears that this would make a disturbance and hurt the feelings of Class K or whoever placed the encumbering ornaments there. We hope that he will do it some time, because it would be a good object lesson on the rights of the pulpit, using that word to represent the teaching function of the Church.

For the pulpit is the one essential thing about a church. We can take away the stained glass windows, the carved wood, the carpet, organ, the pews, the roof, the walls and the floor, but if the pulpit remains the church is alive, just as we can tear off from a flower the sepals and the petals and the stamens until nothing is left but the central pistil and yet the flower will bear fruit. For the Church started over 1,800 years ago with nothing but a pulpit, and altho many other pieces of ecclesiastical furniture, useful and ornamental, have been added since, they are all more or less superfluous. And when some 1,500 years later the pulpit had degenerated to a vestigiary organ, a pretty little ornament stuck up on a pillar of the nave like a lichen on a tree trunk, it required the great upheaval of the Reformation to restore it to its normal central position.

The old saying of the Catholics that, since in the Protestant churches the pulpit takes the place of the altar, the Protestants worship the preacher instead of God, has, too often, sufficient truth to sharpen the jibe, but nowadays the danger is not so much that the power of the preacher will be unduly exalted as that he will be smothered in flowers and beautifully eliminated. Reduced to its lowest terms, a Protestant Church is simply a few hundred persons who have

clubbed together to learn from a modern Paul the way of the kingdom of God. Similarly the same persons go for instruction to one or more physicians and lawyers in whose ability and honor they have confidence and whose expert opinions on hygiene and legality they seek and sometimes follow. A preacher is a religious expert. He has spent years in the study of the moral law as it relates to God, which is called theology; the moral law as it relates to men, which is called ethics, and the duties of men to God, which is called religion. Just as the acceleration of modern life has made it necessary for us to have more frequent consultations with our physician, and as the increasing complications of business have made us more dependent upon our lawyer, so the services of the preacher as a teacher of the duty of man have become more than ever essential. It is only a man of unusual ability and special training and in an exceptional position, such as the preacher is, or should be, who can impartially solve the difficult moral problems of the modern world. He is placed upon a pulpit that he may look over the heads of the rest of us. He is given six days for study that he may tell us upon the seventh what he has discovered.

In a primitive form of society the incidence of one's acts can be pretty clearly seen, and under these conditions only a bad man will continue to do bad things, but the interactions of mankind have now become so extended and complex that one can do a great amount of evil in the world without suspecting that he is not the most moral of men. "My people are destroyed for lack of knowledge," proclaimed Hosea, and it is increasingly true. Good intentions are, we hope, more abundant than ever, but the opportunities to do unintentional wickedness have increased in greater ratio. Fatal blunders are more numerous than crimes. More people are killed by preventable accidents than are murdered.

Applied Christianity has not kept pace with the advance in the other useful arts. Consequently the great need of the age is not a more ornate service, but more systematic, thorough and fundamental instruction in morality. The "Preliminaries" should be pruned back rigidly,

and the sermon made something worth going to hear. The memory of a pleasing harmony of colored light or an organ strain is not likely to check one's actions in the office or shop on Monday. The object of music is to arouse the emotional nature, but what people need nowadays is not more emotion, but more sense. Undirected emotion is dangerous to the community. The opera houses are producing enough of that combustible commodity without the assistance of the churches. An anthem with operatic music, incomprehensible words and non-Christian singers has no religious value. Many of the hymns sung have words far removed from any that a twentieth century American could conceivably use to express any possible emotion. Consequently we have to pay people to sing them to us. Where every one has a copy of the libretto there is no excuse for the minister reading them, unless he is an exceptionally good reader, in which case the singing of them could be omitted. The responsive reading is apt to degenerate into a free for all race with no handicaps for those whose speed in articulation is hampered by a feeling of reverence for the words or a desire to understand them. Altogether the "Preliminaries" as they are now developed and practiced are not of such unquestionable religious value that they should crowd out the sermon, and assigning to them so large a proportion of the service reminds one of running half a mile to make a jump.

#### **The Equitable Should Buy the Stock**

Ex-President Cleveland's admirable letter, in which he consents to act as one of the trustees in charge of Mr. Ryan's Equitable Life Assurance Society stock, simply tends to confirm the prevailing opinion that the trustees were well chosen and that the transfer to them of the voting power of a majority of the shares should be regarded by policy-holders as an important step in the right direction. On the other hand, public discussion of Mr. Ryan's relation to the Society, and of the appointment of Mr. Paul Morton to exercise supreme executive control, does not tend fully to restore confidence in the management. It is unfortunate that Mr.

Ryan's published statements as to his purchase of the 502 shares have not been consistent:

"In connection with some other policy-holders who, like myself, have never had any relations with the Equitable, except as policy-holders, I have purchased from Mr. Hyde a majority of the stock." (Signed statement of June 9th.)

"I have, together with other policy-holders, purchased this block of stock." (Letter of June 9th to Mr. Cleveland.)

"I am the sole owner of the 502 shares, which I purchased from Mr. Hyde, and no other person or interest has contributed a single dollar toward the purchase of the stock." (Letter of June 15th to the Trustees.)

We are not disposed to attach much importance to the variations shown in these assertions. Mr. Ryan now explains that the connection of these other policy-holders with the transaction was "entirely advisory." But he should have said so at the beginning. The true remedy for the present condition of this great institution, and the only one that can fully and permanently restore confidence in the management, is the purchase of the stock by the Society itself, in the interest of the policy-holders. It may be that Mr. Ryan has had in mind a sale of his holdings to the Society whenever new legislation shall enable it to buy them. We shall be glad to give him credit for so commendable a purpose. A purchase of all the capital shares by the Society, even if the cost should be \$5,000,000 (Mr. Ryan paid \$2,500,000 for half of them), would solve the problem. Governor Higgins should ask the New York Legislature to consider at its approaching special session the question of providing the legislation required.

#### Reforming Red Tape

It is easy to see how so direct a man as Mr. Roosevelt should have been many times annoyed at the difficulty of getting accurate and compact reports as to matters that have come before him. There grows up in departments and bureaus a mass of intricate details, many of them of no value, and many most confusing. Curious stories could be reported of the difficulties experienced in the attempt to learn a fact or to get an approved bill settled. The committee which the Presi-

dent has appointed to investigate methods and suggest simplifications does not have for its purpose to discover irregularities, but rather to make the regular ways easier. At the same time simpler methods might well reduce not a little the expense of useless clerks and the reduction of useless documents. The President illustrates the evil he wishes to correct by its effect in a department of which he has special knowledge:

"In the army and navy the increase of paper work is a serious menace to the efficiency of fighting officers, who are often required by bureaucrats to spend time in making reports which they should spend in increasing the efficiency of the battleships or regiments under them."

This is the same evil which in our public schools teachers much complain of, that they are required to give so much attention to reports to superiors that their time for teaching is limited and their strength exhausted.

#### Our Aged Naval Officers

An error in the authority from which it was taken led to Admiral Togo's age being stated as 48 in Mr. Benjamin's recent article. He was born in 1851. This does not alter in any wise the point of the argument, since Admiral Togo at 54 is younger than the admirals and captains and even some of the commanders on our Navy list. Had he entered our service at the earliest possible age (14) he would now be by seniority among the lowest captains or senior commanders, and would still have some eight years of active service before him prior to retirement for age. Some critics have overlooked the fact that the diminished endurance of men nearing sixty is not the sole reason for replacing them at sea by younger officers. If we want competent admirals they must have practical experience afloat as admirals and not merely as captains, and if we want competent captains they must have practical experience afloat as captains and not merely as lieutenants, before the emergency comes. This requires time. Hence the individual must be young enough on reaching command rank to afford that time. A man cannot be kept as a subordinate until the crisis comes and then without command experience be

expected suddenly to bloom into a certainly efficient commander. Individuals may do so—have done so—but the risk involved is too great to warrant its being taken if avoidable. Some misapprehension also exists concerning retirement. An officer retired from active service is not out of the Navy, as many suppose. In fact, he may be now ordered to the most active sort of work on shore, as in navy yards, in the bureaus at Washington, and in many other positions where his long experience and mature judgment may be of the greatest benefit to the country. He draws exactly the same pay while doing such work as do officers on the “active list,” who may be performing the same duties beside him. He simply is not given sea duty on a vessel in commission, altho even this is not necessarily debarred to him. The really important result of his retirement is that it creates a vacancy in his particular grade on the “active list,” because the number in each grade is fixed by law, and into that vacancy a junior can at once be promoted. Officers who are retired for age, or after forty years’ service on their own request, if they have had Civil War service are at once promoted to the next higher grade; if without that service they are retired in the same grade. If they are involuntarily retired under the present special law for creating vacancies and so accelerating promotion they get the promotion, but in the case of captains they advance to commodores and not to rear-admirals. One of the curious results of this is that in a short time the fine old grade of commodore, worn gloriously by Decatur and Preble and Perry, will mean simply men who have been selected out as the least eligible. There is no further promotion after one’s place on the “retired list” is established.

#### Italian Immigration in the South

There are some 200,000 Italian immigrants that reach our coasts each year, nearly all of whom remain about our Northern cities. There are only a few thousands in New Orleans and several other places in the South, but now an effort is making to draw them in larger numbers, and the Italian Ambassador has visited the South to investigate conditions for his countrymen.

We hope the Italians will enter what is to them a new territory. But Italian labor will be a very different thing from the labor to which the employers there have been accustomed. They will strike; they will resist imposition; they will meet mob with mob. Already there have been several Italian riots in West Virginia. They know how, as in Scranton, Pa., to organize a “Mutual Aid Fraternal Italian Association,” the initial letters of which spell *Mafia*. Nor will the Italians be disturbed by that sort of race prejudice which exists in this country and which particularly infects Anglo-Saxons. Italian immigration will doubtless be of real benefit, but it will stir up things in a lively way.

#### A Treaty of Washington

The most notable event of the week has been the definite acceptance both by Russia and Japan of President Roosevelt’s proposal for the appointment of peace envoys, and the selection of Washington as the place where they shall meet. We are far off from Washington’s Farewell Address, for we are frankly taking an interest in the international affairs of the other continent, altho now for the interest of peace. Still the United States is recognized as exercising a benevolent neutrality, because it has no ambitions that are hostile to either party. We want nothing of Russia or Japan, and only want to have our Filipinos rule themselves as soon as possible. It will be quite an honor to the United States that the treaty, which we hope will end the greatest war of modern times, a war between Europe and Asia, should be known as the Treaty of Washington. Meanwhile the war goes on, and before the envoys meet there is likely to be a great change in conditions in Manchuria. It seems most probable that General Linievitch will this time be driven back to Harbin, and it will be strange if the Japanese envoys at Washington do not see the Japanese armies in Russian territory and threatening Vladivostok.

#### The Veterans in Louisville

The reports of the meeting of the Confederate Veterans in Louisville, Ky., are on the whole agreeable reading. The American flag pre-

dominated in the decorations. The Chaplain prayed for the blessing of God on the President of the United States and prayed that he might be President of the whole country. Governor Beckham spoke for Kentucky, and said that in tender memory they had laid aside the stars and bars, and "rejoice to have the same flag that floated over us before the war." General Stephen D. Lee, Command-in-Chief, eulogized Jefferson Davis, as was to be expected; praised the valor of his comrades, and concluded:

"We have taught our children to honor the flag of our reunited country. In the Spanish War we sent our sons and grandsons to follow the flag that our forefathers filled with stars and to which we now give again our unstinted loyalty. Best of all, we restored our beloved land as an integral living part to the Union of our fathers. With us now all passion and bitterness have passed away."

These are wise and helpful words.

In a sermon President Patton said to the students of Princeton University:

"It has been said the meek shall inherit the earth, but we all want the earth nowadays, and I know that it is not the meek who get the earth these days."

On that matter we still incline to hold with the old authority. For example, there is President Patton himself—is he not one of the meek ones, and has he not inherited the earth? Certainly he has, if honor and reputation and a comfortable competence and all good fortune count among the things of earth. We would not charge him with supposing that because he is not a multimillionaire he has not the good things of this world.

That minute drop of quicksilver which the Czar of Russia calls his mind needs fixation. Every last touch pushes it in another direction. Yesterday we heard that he accepted reform, and to-day he will have none of it. By cablegram liberty of worship is granted to the various sects, and by the next Pobiedonosteff is made the Procurator of the whole Empire as well as of the Church. Now Witte, to-morrow Trepoff. It is of no use to prophesy. We can foretell much of comets, but nothing of Nicholas II. What a horrible thing that the peace of

the world should depend on the last puff of the breeze on an aspen leaf! It is enough to excuse, if not justify, Nihilism.

The announced appointment of fifty new instructors for Princeton University, under the designation of "preceptors," whose business it shall be to come into close personal touch with the students individually and in small groups, for the purpose of instruction, deserves to be watched with much interest. The expense of this added instruction must be nearly or quite \$100,000, which is the interest on two millions of endowment. This ought greatly to help scholarship and introduces some of the excellences of the Oxford coach system.

The petitions to Rome for the beatification of Pope Pius IX are multiplying. The matter is pushed by the Abbé Maignen, the one who was so active against Americanism. He is bringing three or four thousand signatures every week, and is now well into his second hundred thousand, mostly from France. So far as we can see the chief glory of Pius IX is that he secured Infallibility and proclaimed the Syllabus of Errors. We are not surprised that the United States spends no enthusiasm as yet.

Temperance legislation, like the bill for marriage with a deceased wife's sister, is gaining friends in the British Parliament. It was by the narrow majority of six that the House of Commons has defeated a bill closing saloons on Sundays, and by an equally small majority that the Archbishop of Canterbury's bill empowering the licensing justices to regulate the hours of closing on all days of the week was defeated. Such a vote, a moral victory, would have been incredible in the days before the great beer magnates were created peers.

It illustrates the advance of public ownership of public utilities that hereafter the railroads in the Transvaal and the Orange River Colonies are to be vested in the High Commissioner, who is their Governor, and be the property of these colonies, under the name of the Central South African Railways.

## The Royal Arcanum Again Raises Its Rates

NOTWITHSTANDING the announcement made in 1898, when the Royal Arcanum previously raised its rates, that no further increase would be required, the managers of this fraternal order have found it needful in order to preserve the Arcanum to again increase its rates. The increase was decided upon only in the face of an increasing death rate and a decreasing reserve fund. At the session of the Supreme Council held at Atlantic City in May, to which reference was made in THE INDEPENDENT of May 18, the rate question was carefully considered, the result being that unless present rulings are altered in response to a storm of protests, increased rates will have to be paid by new members from July 1 and by old members from October 1, 1905. The new scale contemplates a minimum rate of \$7.56 per \$1,000 at age 21 in the place of \$7.08 formerly charged, together with proportionate changes amounting to about 8 per cent. additional to present rates for other ages. There are also options of step rates, level rates and reduced benefits available to old members. The trunk line rate for all present and new members upon which they are placed at their attained ages, if they do not select one of the available options, is a term rate to age sixty-five and a level rate during membership.

The construction of the rate has been designed with the idea of avoiding the needless accumulation of reserve, but is somewhat loaded in order to provide for any impairment of the risk when the member reaches the age of sixty-five, and to permit of his then taking the level rate without a new medical examination. The trunk line rate is a constant rate without change from date of entry to age sixty-five. The increase in rates now determined upon was inevitable and at least one of the options calls for the accumulation of an adequate reserve to maintain a constant rate for the whole period of life.

It would appear from the present stiffening of the Royal Arcanum rates that some of the fallacies of fraternal insurance are passing and that with the adop-

tion of 28-year experience or mortuary tables as a rate basis at least one step toward conservatism had been taken. The present rate changes, it may be said, bear particularly hard on the old members. Doubtless those charged with the management of the Royal Arcanum sanctioned the changes now made with great reluctance, but concurred in so doing when it was pointed out to them that this was essential if the order itself was not to be overtaken by destruction.

Considerable opposition to the increased rates has already been manifested not only on the part of local councils, but there is a feeling of revolt at the new order of things in all of the thirty-seven States where the organization has its councils. Some members have hinted at other than disinterested motives in the case of certain members of the Supreme Council in which the scheme of increasing rates originated. No evidence establishing lack of good faith in any case, however, has been presented. The formation of a new association by the "belligerents" has been threatened.

### DIVIDENDS announced:

- International Silver Co. (Debenture Coupon No. 5), payable July 1st.
- Interborough Rapid Transit Co., 2 per cent., payable July 3d.
- Atch., Top. & S. F. Rway. (Preferred), \$2.50 per share, payable August 1st.
- Mergenthaler Linotype Co. (Quarterly), 2½ per cent., payable June 30th.
- Western Un. Tel. Co. (Quarterly), 1¼ per cent., payable July 15th.
- Franklin Trust Co. (Quarterly), 3 per cent., payable June 30th.
- N. Y. Cent. & H. R. R. Rd. (Quarterly), 1¼ per cent., payable July 15th.
- Otis Elevator Co. (Preferred) (Quarterly), \$1.50 per share, payable July 15th.
- Amer. Can. Co. (Preferred) (Quarterly), 1¼ per cent., payable July 1st.
- Minn. & St. Louis R. R. (Preferred), 2½ per cent., payable July 15th.
- United Fruit Co. (Quarterly), 1¾ per cent., payable July 15th.
- Natl. Sugar Ref. Co. (Preferred), 1½ per cent., payable July 3d.
- Southern Pac. Co. (Various Dividend), payable July 1st.
- Real Estate Trust Co., 5 per cent., payable July 1st.
- Wells, Fargo & Co., 3 per cent. and extra 1 per cent., payable July 15th.
- Natl. Butchers' & Drovers' Bk., 3 per cent.
- Bowery Savings Bank, 4 per cent.
- Metropolitan Savings Bank, 3½ per cent.

## Southern Railroads Attacked

IMPORTANT questions are involved in the petition of the Receivers' and Shippers' Association of Cincinnati to President Roosevelt for action by the Government in the courts against the railway companies and freight associations of the Southeastern States. These petitioners allege that the Southern Railway Company, the Atlantic Coast Line, the Southeastern Mississippi Valley Freight Association and the Southeastern Freight Association are such combinations in restraint of trade as are forbidden by the Sherman Act; that the agreements of the two associations are unlawful, and that the two railway companies, with others operating in the Southeastern States, combined and conspired unlawfully in December last to maintain certain rates from all Ohio River and Mississippi River points to the territory of which Georgia may be regarded as the center, together with certain other rates from Boston, New York, Philadelphia and other northern seaboard points to the same territory. Complaint is made that these rate agreements discriminate unjustly against the Upper Mississippi Valley and in favor of the Northeast, and it is asserted that "a combination owning or controlling railroads leading from all the principal gateways into a common territory of destination has power to restrain trade as effectually as does a combination of two parallel and naturally competing roads." The Government is asked to apply for an injunction restraining the two railroad companies from exercising control over other Southern roads, either by acquiring stock or by voting the stock already acquired, and for a dissolution of the two freight associations. Attorney-General Moody has the petition under consideration.

If the Government should grant the petitioners' application, and if the courts should sustain their allegations, the effect of the decision would be much greater—with respect to existing railway systems—than that of the decision in the Northern Securities case. If the allegations correctly represent existing conditions, then these appear to be in opposition to the rulings of the Supreme Court in the Trans-Missouri and Joint Traffic Asso-

ciation cases. Also, so far as control of competing roads is concerned, they seem to be in conflict with the principle established by the Northern Securities decision. The application is said to have been suggested in part by the active opposition of prominent officers of the railroad companies in question to the President's freight-rate policy.

THE Lawyers' Title Insurance and Trust Company, of which Edwin W. Coggeshall is president and general manager, has a capital of \$4,000,000, a surplus of \$5,000,000, and undivided profits of \$631,984. The total assets amount to \$20,124,048.

....Frank G. Bigelow, who recently embezzled more than \$1,500,000 of the funds of the First National Bank in Milwaukee, of which he was president, has pleaded guilty to ten indictments and been sentenced to be imprisoned for ten years at hard labor.

....The Western Union Telegraph Company's quarterly report, issued in connection with the declaration of the customary dividend, shows an increase of the surplus from \$15,821,523 on March 31st, to about \$16,023,202 at the end of the present month.

It is announced that the suit of Mrs. Ida E. Wood against the Mercantile Trust Company, John J. McCook and others, to recover \$195,000 invested by her in the bonds of the Shipyard Trust, has been settled out of court on terms quite satisfactory to the plaintiff.

....A special train on the Pennsylvania road on the 5th inst. ran from New York to Chicago in 17 hours, or at the average rate of 52 miles an hour. Greater speed was made on the 8th, when a train ran from Pittsburgh to Chicago in 440 minutes, or at the rate of 63½ miles an hour. For 126 miles the rate was 75 3-10 miles an hour.

....Apparently because of a movement in the Connecticut Legislature for the promotion of telephone competition in that State and for changes in the present law, which practically gives a monopoly to the Southern New England Telephone Company, that company announces a reduction of from 15 to 25 per cent. in its rates.

# The Independent

VOL. LVIII

NEW YORK, THURSDAY, JUNE 29, 1905

No. 2952

## Survey of the World

### The Venezuelan Scandal

The departmental inquiry in reference to Mr. Loomis's conduct in the Venezuela scandal which has been held in Washington for the past few weeks closed last Tuesday. The first charge, that Mr. Loomis received a bribe of \$10,000 from the New York & Bermudez Asphalt Company, Secretary Taft finds was not sustained by "a scintilla of competent evidence." In regard to the second charge, that Mr. Loomis became interested in the Mercado claim without advising the State Department, Mr. Taft says "that Mr. Loomis ought to have informed the State Department of this transaction, but his action was not dishonest and did not involve the use of his office to influence or bring about his personal profit." As to the third charge, that Mr. Loomis entered the employ of American syndicates to secure and carry out a contract for refunding Venezuelan loans, Secretary Taft finds "that Mr. Loomis had not done other than to use his good office to bring together the head of the Venezuelan Government and the person who possibly might have aided the Venezuelan Government in readjusting and refunding the debt"; but "he was certainly treading on dangerous ground in bringing his official life so close" to such a transaction. The fourth charge, that Mr. Loomis used his office to break up an arrangement which Mr. Bowen had about completed with the Venezuelan Government for the arbitration of all questions in dispute between the United States and Venezuela, is "wholly unfounded," as Mr. Loomis

requested that he have nothing to do with the Venezuelan policy of the Government when he became Acting Secretary of State. The fifth charge, that Mr. Loomis wrote a letter to one Carner saying that the United States would not intervene against the interest of the New York & Bermudez Company, has "no foundation whatever." As to the sixth, that Mr. Loomis was engaged in mining concessions, Secretary Taft says "that it did appear that he accepted the power of attorney for organizing a West Virginia corporation for the purpose of carrying on mining operations in Venezuela, but that the proposition was never put through because of the failure to raise sufficient capital." The seventh charge, that he became interested as a partner in the firm of Paquet & Co. in the construction of a railroad, was answered by the fact that the railroad project was never carried through. Secretary Taft, in conclusion, exonerates Mr. Loomis of corruption, but says that he ought not to have engaged in outside deals while in public service, and he hopes that his "bitter" experience will be a warning. President Roosevelt briefly accepted Secretary Taft's entire findings in regard to Mr. Loomis and then devoted himself to Mr. Bowen, whose actions he calls "inexcusable" and so insubordinate as to unfit him to hold a position in the United States diplomatic service. The President quoted an order of the State Department showing that no Minister is permitted to make charges against any other officer of the service, except in a communication to the Department

of State, and then goes on to quote the testimony of the case to show that Mr. Bowen volunteered to representatives of the press information in regard to Mr. Loomis, and in fact that Mr. Bowen had become a "monomaniac" on the Loomis subject. Under the circumstances he held that Mr. Bowen's conduct is especially reprehensible because of the damage it has undoubtedly done to the interests of the country, and this irrespective of whether Mr. Loomis is guilty or not. He added that he would like to have promoted Mr. Bowen, as he had been a long time in the service and his record had been in many respects excellent, but he felt it was impossible to retain him without exposing the interests of the Government to a risk so great that it could not justifiably be taken.

**Mr. Bowen's Defense** Mr. Bowen's statement was issued on the following day. He said that the Venezuelan scandal "constituted a national disgrace and it would never be settled until it is settled right." When he first went to Venezuela he found that Mr. Loomis had an unsavory reputation and that reports were being circulated everywhere which reflected upon his honor as an official and a man. When going through the Legation archives over a year ago he found documents which seemed to incriminate Mr. Loomis. These he forwarded to the State Department, and received an acknowledgment by Mr. Hay, in which the latter said, "I have been greatly surprised and pained in reading the documents you sent to me." Mr. Bowen says that meanwhile, on his return from representing Venezuela at The Hague, the scandal got worse and worse, and finally, shortly after the first of this year, he was informed that a check to Mr. Loomis and a letter from him compromising the United States were reported to be in the possession of President Castro. He transmitted this information by a letter of February 12th and also cabled. Three days after his cable was received in Washington he received a return cable from the State Department offering a post that was in-

tended to be his stepping-stone to an ambassadorship. Mr. Bowen refused this, as he considered it a veiled bribe. He denies that he instigated charges against Mr. Loomis and says that the scandal was published in *Le Temps* of Paris about a month before it appeared in *The New York Herald*. Some of the incriminating papers that Mr. Bowen found in the archives of the Legation, which he forwarded to Secretary Hay, are as follows:

"LEGATION OF THE UNITED STATES,

"CARACAS, August 25th, 1900.

"W. W. RUSSELL:

"Dear Sir.—In reference to the portion of Mr. Mercado's claim which I bought, I want to state that the only terms of settlement which I will accept, other than a full cash payment of about 30,400 bolivars in gold, are the following:

"I will accept 20,000 bolivars in gold and 10,400 bolivars in salt bonds at the rate of 82 per cent., or 5 per cent. below the quoted market rate, provided it does not go below 80 per cent.

Very truly,

"F. B. LOOMIS.

"If the matter is settled, please deposit the cash and bonds to my credit with H. L. Boulton & Co.

F. B. LOOMIS."

"I received for Mr. F. B. Loomis the amount of 20,000 bolivars in cash and 12,000 bonds of the salt, amount which I have this day delivered to Mr. W. W. Russell.

"CARACAS, September 27th, 1900.

"A. D. JAURETT."

"LEGATION OF THE UNITED STATES,

"CARACAS, VEN., July 9th, 1900.

"FRANCIS B. LOOMIS, United States Legation, Caracas, Venezuela:

"Dear Sir.—In consideration of the services rendered by you to me and my associates in the matter of securing the contract for furnishing the Government of Venezuela with a loan to refund or convert certain of its standing debts, I beg leave to assure you that it is agreed and understood by me and my associates that you are to receive one-seventh of the gross profits—when the contract is fully complied with and the deal consummated—which may be realized by us on this transaction as a whole and on all of its parts and phases, said profits by this time being estimated at about ten million dollars.

"It is further understood and desired by us that you shall continue to render us all the assistance you properly can while in Caracas till the transaction is brought to a conclusion and the loan duly ratified and issued. It is also understood that you will have a general super-

vision in Caracas of any publication we may deem it necessary to have in connection with the proposed bond issue.

"CHARLES R. MAYERS."

Mr. Bowen explains that Mr. Jaurett's name was frequently coupled with that of Mr. Loomis in the investigation, and Jaurett was a fugitive from justice from Mexico. Mr. Russell is now our Minister in Venezuela. Mr. Loomis explained the letter from Mr. Mayers on the ground that if the deal had gone through, which was to have given him a seventh of the ten million dollars, then he would have resigned from the service. To which Mr. Bowen rejoins:

"The conduct of the man who as American Minister was willing to participate in such transactions as the foregoing is considered by his official superior as merely 'indiscreet,' and he is retained in the public service.

"My personal fate and fortune are of slight interest to the public. But it does concern the whole country that its diplomatic representatives abroad should be men of unsullied reputation, and every American citizen should be especially concerned when a man whose conduct as Minister to a foreign State has been the cause of scandal is promoted to the high office of First Assistant Secretary of State and controls important negotiations with the very Government at whose capital the scandals were current."

Mr. Loomis left for Europe last week, where he goes as Special Ambassador from the United States in the ceremonies attending the removal of the body of Admiral Paul Jones to the American warships, and also as confidential investigator into the business methods of the various American legations in Europe.

#### Panama Canal Plans

Chief Engineer Wallace arrived at New York from the Isthmus on the 22d, and was preceded by reports from Panama that it was his purpose to resign. These reports asserted that he was taking with him all his personal effects. No cause was assigned, however, for resignation, beyond a rumor that more attractive employment had been offered to him. At last accounts there had been no confirmation of the reports. The President has issued a call for a meeting of the Board of Consulting Engineers on September 1st in Washington. This

board is composed of the following members:

General George W. Davis (chairman), Alfred Noble, William Barclay Parsons, William H. Burr, General Henry L. Abbott, Francis P. Stearns, Joseph Ripley, Isham Randolph, Herman Schussler, Henry Hunter (nominated by the British Government), Herr Eugene Tincanuser (nominated by Germany), M. Guérard (nominated by France) and M. Quellenec, consulting engineer of the Suez Canal. Another engineer will be designated by the Government of The Netherlands.

All the plans proposed to or by the Canal Commission will be considered by the board. The most important of the questions before it will be the one whether the canal shall have locks and a summit level or be constructed at the level of the sea.—Cases of yellow fever are reported daily at Panama and Colon. The Commission will build three new hospitals and assume control of those in Panama. Governor Magoon has decided to erect 42 schoolhouses in the Zone. Within 1½ miles of the railway there are nearly 2,000 children of school age, and 935 of them cannot read.

#### The War Upon Philadelphia's Ring

Mayor Weaver and his supporters are pursuing the defeated ring, with a prospect of recovering a part of the money that has been stolen. At the beginning of last week, John W. Hill, chief engineer of the filtration works, was arrested and held for trial on the charge that he had increased the payments to ring contractors (the Durham-McNichol firm) by fraudulent certificates. Mr. Hill is well known in his profession. He came to Philadelphia from Cincinnati, and was until recently held in high esteem by Mayor Weaver, who caused his salary to be increased from \$12,000 to \$17,000. On the 23d he was arrested a second time upon additional charges of the same kind. The testimony on which he has been held for trial is that of subordinates (one of whom had been discharged, and the other transferred, at his request), and of official records which appear to support their assertions. In one instance a legitimate allowance of \$45 to the contractors was raised to \$41,000. Mr. Hill wept in

court. He asserts that the witnesses against him perjured themselves. It was shown at the hearing that responsible low bids for work on the filtration beds were rejected and the much higher bids of the Durham firm accepted. One of the contracts has been annulled by the Mayor. A thorough investigation of the Filtration Bureau's accounts is to be made by experts from New York, and the work itself is to be examined under the direction of William Barclay Parsons, who planned the New York subway and is one of the Panama Canal Commission's engineers.—As the result of the inquiry made by the Civil Service Commission, at the direction of Mr. Roosevelt, Clarence Meeser, Deputy Collector of Internal Revenue, has been removed from office. He was associated with Salter in the ballot box frauds of 1899. At that time he was a clerk in the Congressional Library at Washington. With Salter he disappeared, remained away for two years, and then returned to be tried and acquitted. The Civil Service Commission believes that he was guilty. Before his return to Philadelphia, one of the men indicted with him had pleaded guilty and served a term in the penitentiary.—Joseph Donnelly, an assessor (as those in charge of the voting lists are called), pleaded guilty, last week, to the charge that he had added 401 fictitious or fraudulent names to a voting list which had contained only 376. This was at the election in November last. Five thousand men are to be set at work examining the lists in order that the fraudulent names on them may be removed.—Boss Durham was in conference with Governor Pennypacker at Harrisburg, last week, and upon his return he denied that he intended to give up the office of Superintendent of Insurance. He also said that there would be no special session of the Legislature. Such a session is desired by the opponents of the ring, in order that the "ripper" bills approved by the Governor may be repealed and a personal registration law passed. The Methodist ministers of Philadelphia have asked the Governor to remove Durham.—Twenty-one Republicans, members of the Union League, suggested to the Republican City Committee (which is controlled by

the ring's friends) that it should withdraw the ticket nominated for the coming election and substitute other names. The leading nominee is Henry C. Ransley, for Sheriff. He is president of the Select Council. With other nominees on the ticket he was prominently active in support of the gas lease. The Republican Committee has adopted resolutions in accord with the suggestion made and has expressed a desire for "reform within the party." It has also appointed a committee to confer with the reform organizations. Two of the three members are David Martin and David H. Lane, whose names do not inspire confidence among reformers familiar with the history of politics in Philadelphia. The Committee of Nine declares that there must be no compromise nor any dealings with the Republican Committee, which, it asserts, is corrupt and should be opposed by the Citizens' Party.

#### A Fast Train Wrecked

Both the Pennsylvania and the New York Central Railroad companies recently reduced the running time of their fastest trains between New York and Chicago to eighteen hours. The distance is 904 miles by the Pennsylvania route and 961 miles by the Central. Five stops are made by the Pennsylvania train, with a change of locomotives and crews at each one; the Central makes six. In parts of each route great speed is attained, the Pennsylvania's train covering one stretch of 131 miles in 115 minutes, while the Central's at times moves at the rate of more than 70 miles an hour. On the first eastbound Central train (June 18th) two passengers from Honolulu arrived in New York, having crossed the continent from San Francisco in 84¼ hours. Three days later this fast service on the Central's route was interrupted by a shocking accident at the Mentor station in Ohio, a few miles east of Cleveland. While the train was passing the station at a speed of more than 60 miles an hour it left the main track at an open switch and was wrecked. The locomotive struck and partly demolished a freight house, and the forward passenger car was thrown upon it. There it was consumed by fire. All the passengers who lost their lives

(21 were killed) were in this car. It is believed that the switch had been opened by some person unknown, who sought thus to wreck the fast train. After the accident the old running time of 20 hours was restored, but the 18-hour service was resumed on the 26th, a careful investigation by the company and by the Railway Commission of Ohio having shown conclusively that the accident had not been caused by the increase of speed.

#### Our Islands in the Pacific

The Filipino newspapers at Manila are again at variance with the Government. For libeling Colonel Baker, of the constabulary, the editors of *Renacimiento*, the most influential of these native journals, have been arrested. The Colonel was accused of cruel action in the campaign against ladrones in Cavité, where wealthy natives were found to be in alliance with these outlaws. It is expected that the Government will prosecute *Democracia*, the organ of the Federal party, and possibly other journals, for publishing attacks upon American rule.—Secretary Taft and his party of tourists will sail from San Francisco on July 8th. The first stop will be at Honolulu, and the second at Yokohama. For three days the Secretary will be the guest of the Mikado.—Governor Carter, of Hawaii, has resigned and is coming to Washington for a conference with the President concerning the condition of the islands. It is reported that his resignation was due to dissension in the political party with which he is affiliated.

#### Mr. Roosevelt at Williams College

During his visit to Massachusetts, last week, the President made several addresses, the longest of them at the commencement exercises of Williams College, when the degree of Doctor of Letters was conferred upon him. After urging the new graduates to cherish high ideals he turned to national topics. Having explained that he had responded to Santo Domingo's appeal in order that the people of the republic might be helped and also to prevent such complications with

foreign nations as might be caused by a forcible collection of their claims at the republic's ports, he repeated his familiar views concerning the Monroe Doctrine and the need of a good navy as a guaranty of peace. We must build up the navy, he said, and keep it at the highest point of efficiency, "or quit trying to be a big nation." Remarking that under present industrial conditions "the man who goes into money-making as his only career gets an altogether disproportionate reward," a reward "altogether too great," he urged the expediency and necessity of subjecting great industrial combinations to close supervision by the national Government, and said that he hoped to see, as a first step toward such supervision, the enactment of laws for the regulation of railway rates.

#### Norway and Sweden

The Riksdag or Swedish Parliament met in extra session at Stockholm on call of King Oscar to consider the action of Norway in declaring the dissolution of the union between the two countries. The Address from the Throne declared that the union could only be dissolved by mutual consent and that Norway had no right to take the action it has. But the King and the Council of State adopted a conciliatory attitude and a Government bill was introduced asking for authority to enter into negotiations with the Norwegian Storting in order to establish a basis for a dissolution on which both countries can agree and by which their amicable relations can be maintained. The position of the Government has met with strong opposition in Stockholm and among the members of the Riksdag, so there is some doubt of the passage of the bill. The advocates of a more belligerent policy think that the Government should insist upon guaranties from Norway before consenting to negotiate for a dissolution of the union and they advocate the granting of an emergency appropriation of \$25,000,000 for the mobilization of the Swedish army and the cession of Northern Norway as compensation to Sweden. It is thought that the Moderate party will prevail and the many intricate and

delicate questions involved in the separation may be amicably arranged.

#### The Hungarian Situation

The Hungarian difficulty is brought no nearer solution by the action of the Emperor-King Francis Joseph in appointing General Baron Fejervary as Premier of Hungary. His Cabinet was a neutral and business-like one, composed of men who have not been prominent in party politics, and no members of the present Hungarian Parliament were included in it. Its object was simply to carry on the Government in its present condition without adopting any new policy and nothing more was asked of the Hungarian Diet than the voting of the necessary appropriation and of the usual military measures. But both Houses of the Diet passed a vote of want of confidence in the Fejervary Ministry, and the Premier will apparently be forced to resign or to attempt to govern Hungary without a Parliamentary majority. This would be regarded by many Hungarians as an attempt by King Francis Joseph to establish a military absolutism and would arouse intense opposition and national feeling, which would take the form of passive resistance, if not of armed rebellion. Count Julius Andrassy is the logical candidate for Premier, but he could not hold together the coalition majority in the Diet without making the concessions in regard to the use of the Magyar language and separate tariff regulations demanded by the Independence party of Francis Kossuth. The example of Norway in divorcing herself so easily and peaceably from an uncongenial companion has encouraged the Hungarians in their hopes for independence.

#### The Moroccan Question

The conciliatory policy adopted by Premier Rouvier in dismissing M. Delcassé from the Foreign Office and in provisionally accepting the plan of Germany for an international conference about Morocco has cleared the air somewhat from war clouds, but all apprehension of a serious conflict will not dis-

appear until it is known whether these concessions will pacify Kaiser Wilhelm or incite him to press his advantage. M. Rouvier in his note to Prince von Radolin, the German Ambassador at Paris, called attention to the rights already acquired by France in Morocco and to her exceptional position in Algeria, from which Morocco is separated by a long and indefinite boundary line. If the proposed conference of the Powers is not empowered to interfere with the legitimate interests of France in the country, and it does not discredit the treaties already entered into by France with England and with Spain in regard to Morocco, France would agree to such a conference. She has no desire to overthrow the authority of the Sultan, nor to shut out other nations from commercial privileges. Prince von Bülow, the German Chancellor, has communicated his reply to the French Ambassador at Berlin, but its contents are not disclosed. It is reported, however, that Germany objects to approving beforehand of the French treaties with England and Spain and asks for a more definite statement of the French claims in Morocco. Much attention is being given in both countries to the question of their relative military strength. The *National Zeitung* warns France against depending upon the support of England, for a Franco-German conflict would not be decided by a Trafalgar, but upon Continental battlefields. The present peace footing of France is 530,000 men, which could be doubled by calling out the First Reserves of trained and able bodied men, and the Second Reserves and Territorial Militia could be used if necessary. The equipment of the reserves is always kept in readiness in the barracks, and the mobilization arrangements are thought to be very complete and speedy.—The propensity of the Kaiser to send off telegrams expressing emphatically his personal opinions on important public questions without previous consultation with his official advisers has often caused embarrassment to the Government. Recently, it has been noted, all his political telegrams have been countersigned by Chancellor von Bülow, and it is thought he has been persuaded to adopt that policy for the future.

**Riots at Lodz  
and Warsaw**

The antagonism between the troops and workmen in Polish cities reached a climax in the massacre of Friday, June 23d, at Lodz, a textile manufacturing city of some 400,000 inhabitants, chiefly Germans and Jews. Here, where religious differences, racial antipathies and industrial difficulties have intensified the grievances against the Government, the revolutionary spirit has shown its most violent manifestations. The brutality of the Cossack patrols was retaliated by bombs, and a smoldering feud has continued for several months, until it broke out in street fighting recalling the days of the Commune in Paris. On Thursday night the patrols were attacked by workmen, and two officers and seven Cossacks were killed. One of the soldiers was shot by a 13-year-old girl. Barricades were erected across the streets of the Jewish quarters and wire entanglements constructed from the telegraph and telephone lines, obtained by cutting down the poles. Two bombs thrown into the barracks in the morning killed or wounded 20 soldiers. The Cossacks, dragoons and infantry fought all day in the streets with the factory hands, who were behind the barricades and in the houses. Repeated volleys from the troops caused great slaughter in the dense mob, while from the windows of the houses the rioters replied with revolvers and poured vitriol down on the heads of the soldiers. On one side there were the regiments of troops and on the other some 50,000 strikers and revolutionists, armed and unarmed, and including many women and children. A Jewish girl who was haranguing an immense crowd in the market place from a box was shot by the police. Children were seen kissing the red flag and swearing to die for liberty. As the soldiers passed along the streets they fired at every one who appeared in sight, even in the windows, regardless of age and sex. At night the fighting stopped, except for occasional shots, because there were no lights in the streets, and the Cossacks gathered up and threw into carts the bodies of the slain and the wounded,

some of whom had lain without medical aid for hours. On Saturday, June 24th, the rioting was renewed, but the troops, reinforced from Warsaw, captured the last of the barricaded streets and houses by the aid of sappers. A bomb thrown into the barracks killed four and wounded 16 of the Cossacks and killed 23 of their horses. There are no reliable figures as to the total number of casualties, but it is estimated at 2,000. An additional cause of disturbance was the free liquor obtained by the looting of 35 of the Government liquor shops. The cash and stamps found in them were turned in to the revolutionary fund. Some 12,000 persons have already left Lodz in fear of further disorder. A Jewish family of five persons, driving to the railway station in a cab, was attacked by Cossacks, who shot all of them, including the cab driver.—In Warsaw the workmen struck out of sympathy with those of Lodz, and paraded the streets wearing mourning and carrying red flags. Several bombs were thrown on the one side and volleys fired on the other, resulting in the injury of a few persons. Stephen Okrijeia, the locksmith who threw a bomb into the police station March 6th, was condemned to death by court-martial, but in consequence of the demonstrations made in his behalf the sentence has been reduced to 20 years at hard labor. A general strike of all workmen and the closing of all stores and restaurants have been ordered by the Socialists.

**Russia and  
Peace**

There has been no apparent advance in the peace negotiations during the week. Neither Russia nor Japan has publicly announced her choice of envoys, and there is no prospect of an armistice in Manchuria. The names of the envoys have doubtless been conveyed to President Roosevelt, and it is expected that they will be able to meet in the early part of August. That the Czar has become convinced of the impossibility of holding Manchuria and of expanding the empire in the Far East is thought to be proved by the abolition of the Viceroyalty of the

Far East by an imperial ukase of June 21st and the suppression of the Far Eastern Committee. This retires Admiral Alexieff, who as Viceroy is regarded as very largely responsible for bringing on the war. After great hesitation and delay the Czar consented to receive the delegates from the Congress of the Representatives of the Zemstvos, which met recently at Moscow, and listened for half an hour to an address by Prince Trubetskoi on the evils of bureaucracy and the desire of the Russian people for a national assembly as promised by the Czar. In his reply the Czar said:

"Dissipate your doubts. My will is the sovereign and unalterable will, and the admission of elected representatives to works of State will be regularly accomplished. I watch every day and devote myself to this work."

The Ministry of the Interior a few days later issued a circular denying the inference of some of the newspapers that the Czar had promised a constitutional representative assembly like those of other nations.

"whereas it was clearly shown by the Emperor's words that the conditions of such a convocation were to be based on an order of things responding to Russian autocratic principles, and His Majesty's words contain absolutely not the least indication of the possibility of modifying the fundamental laws of the empire."

Newspapers are prohibited from publishing any but the official version and from drawing from it any unwarranted deductions.—Contrary to previous reports, it is announced that the Czar has decided that it is not expedient to give legal equality to the Jews, as it might lead to outbursts of popular ill will.—Oyama's armies are advancing upon the positions held by the Russians and several minor engagements are reported. Besides the attack along the railroad in the direction of Harbin and on the east and west of it a Japanese army is fighting its way toward the northeast in the direction of Kirin, and extensive movements are reported in Northern Korea, as tho it were the intention of the Japanese to inflict a decisive blow upon Linevitch

or cut off Vladivostok before the peace plenipotentiaries meet.

#### A New Spanish Ministry

The Villaverde Cabinet, which has only been in power since last January, is discredited by a vote of 204 to 45 in the Cortes. Its fall is due to a combination of all the Republican, Anti-Clerical and Liberal factions and the open or secret aid of many of the Conservatives, including, it is suspected, ex-Premier Maura. There have been six Ministries in the last 26 months, all Conservative, and differing only in minor details of policy. Señor Villaverde's policy is economic rather than political, and whenever he has been in the Cabinet as Finance Minister or Premier he has endeavored to develop the industries of the country by carefully regulated protective tariff and similar measures for putting the finances of the Government on a sound basis. He has kept the Cortes suspended ever since assuming office in order to complete his Budget for 1906, and, as he said, that the visit of King Alfonso to France and England should not be embarrassed by Parliamentary complications. This caused a great deal of animosity against him from both Liberal and Conservative members, who disliked to be thus shut out from all participation in the Government, and was one of the grounds of the opposition to the Ministry. The Republicans in the Cortes also attacked Señor Villaverde on the Moroccan question, and on the letter of the King of Spain to Cardinal Casañas in which he expressed his disapproval of Protestant churches in Spain. Since the experience of the past two years has shown that a Parliamentary majority cannot be held to the support of a Conservative Ministry, the King was forced to choose between the alternatives of dismissing the Cortes or authorizing a Liberal leader to attempt the formation of a Cabinet. He adopted the latter course and has approved of the Cabinet formed by General Montero Rios, which includes as Minister of War General Weyler, formerly of Cuba.

# Midway

BY MARY A. MASON

I AM not old, I am not young,  
'Tis neither dawn nor is it eve;  
The gayest songs may have been sung,  
More may I give and less receive.

Turn back? Why, no; The sun is high;  
The rose of morning lingers still,  
To blossom with a deeper dye  
When evening comes across the hill.

CONSTANTINOPLE.

## Modesty: Feminine and Other

BY CHARLOTTE PERKINS GILMAN

AUTHOR OF "THE HOME," "HUMAN WORK," "WOMAN AND ECONOMICS," ETC.

AS our list of current virtues swings and changes down the years, with remarkable coat-turnings and somersaults and attachments as varied as those of schoolgirls, none shows us a more checkered career than Modesty.

She is quite an old virtue—not as old as Self-sacrifice, which is coeval with motherhood; nor as Perseverance, which far antedates humanity; but older than Hospitality, for instance, or those modern developments such as Justice and Honor.

Like many other virtues, she has a mixed parentage, and her own variations make it difficult to trace her ancestry; but she is clearly allied to Humility on one side and on the other to a vastly different feeling—sex-consciousness!

As far as modesty shows traces of humility it belongs to both sexes, as when we note "the natural modesty of youth," or that of a learner among experts, or the ignorant among the wise; and modesty of this kind is a fairer and finer thing than the more extreme form of humility, which grovels.

Modesty does not grovel. It does not underrate itself. It simply recognizes an undeniable status of inferiority, perhaps only temporary, and is quite compatible with pride. We even hear sometimes of "a modest pride," but hardly can so adduce "a humble pride." Modesty of this

sort is becoming. It is a mark of wisdom, of ability to recognize facts, and of self-control, which is one of the greatest virtues of all—a root virtue, absolute requisite of many others. This modesty, proof of clear perceptions, good judgment, a sense of justice and self-control, is to be admired and cultivated, altho the natural variety is far superior to the cultivated as showing better inherent qualities.

But those who have it not may set themselves to acquire it, because even the acquired kind is preferable to none. Not to have any shows the immodest person to lack not only those fine qualities above mentioned, but even the sense and ability necessary to cultivate them.

The modesty we hear of most, however, "*pudor*," is of quite another sort, being the direct product of sex-consciousness and connected with Shame—a singular relation for a virtue!

The most familiar variety is feminine modesty, and in especial "maiden modesty," and its conspicuous sign is the blush, which is also the sign of shame. That hot flush which man, woman or child feels and shows when caught in some guilty act is also the flaming symbol of this much praised virtue—"maiden modesty." In a certain crude but legitimate sense we are quite right in calling it a virtue.

At bottom all virtues are simply essential qualities: essential to race, class, sex, or profession, and in women it is therefore a virtue to be feminine. When a girl blushes if a man looks at her it shows that she is a female and acutely conscious of it; also acutely conscious that he is a male. She does not blush when a woman looks at her.

This is a natural phenomenon certainly, and right enough in its way, but it does not belong in the catalog of human virtues, much less Christian ones.

This sensitive response to the presence of the opposite sex is sometimes so extreme as to seem—in paradox—almost immodest.

For sex-modesty in the human race leads to concealment of this great impulse and attraction. The lower animals are "pure" and "innocent," but hardly "modest." It is only the human who has learned this delicate secrecy, this ideal of withdrawal for its lovemaking. How contradictory, then, that we who would thus seclude ourselves when moved by this feeling, who would by no means make public our sentiments or sensations, should thus praise and admire as a virtue the rosy symbol of an aroused sex-consciousness!

To be consistent we should rather call the girl modest who showed no such acute perception of masculine advance, but met all men with calm-eyed serenity and saved her blushes for her lover alone.

Along this line of observation it is amusing to trace one of the most eccentric of all human manifestations, our ever-varying theory of modesty—sex-modesty—in dress.

In the first and broadest division this has always been mainly exhibited by women. Men—who were a good deal more than males—have always had to dress in accordance with the needs of their human service, as soldier, sailor, smith, or whatever; but women were supposed to be first, last and always creatures of sex and to dress accordingly.

Here enters the first paradox in this mountebank group; note it carefully:

*Pudor*—sex-modesty—is an instinct of concealment.

As specially distinctive of the female it is also an instinct of withdrawal. But the human female, who is supposed to be

pre-eminently "the sex," and pre-eminently modest, must so dress as to cry aloud to all beholders, "I am a female—don't forget it!"

On the level plains of our great West a common measure of a mile is "as far as you can tell a man from a woman."

It is quite possible as a matter of social evolution during the many centuries of ceaseless warfare when men were killed at sight and women spared—as valuable slaves—that a conspicuously distinctive dress was a natural protection to the women; also it may be suggested that its adoption by monks and priests was a piece of "protective mimicry;" but these have nothing to do with modesty, unless, indeed, the humility-modesty of marking one's self a non-combatant, a helpless thing.

This is not what we mean by modesty in a woman's dress, however.

We mean sex-modesty, female modesty, and we have that marvelous elasticity of brain which enables us to call it modest in a woman to so dress as to proclaim sex, sex, and nothing but sex, in every article of her attire.

This dress of hers may or may not be healthful, may or may not be beautiful, may or may not be useful, may or may not be economical; but it must be "feminine" above all! That a creature usually cut off from every other means of livelihood but one, sex-dependence, should naturally enough seek loudly to announce her only claim for support is perfectly rational, perfectly defensible, perhaps unavoidable, but hardly to be called—modest!

Paradox No. 2 in our collection is this:

In all nature the female sex, the persistent race-type, is "modest" in the sense of being dull in color, simple in form, quiet in demeanor. She is in herself the attraction, the eternal drawing power; for her and to her come the males, numerous, varied, ardent, venting their superfluous energies in a thousand gaudy decorations, strutting and battling before her, an endless exhibition of what Ward calls "male efflorescence," all to win the favor of the female.

But with us the male is the race-type. As he develops the social functions and takes part in them he becomes more and more "modest" in his dress. He dresses

for use; he must, because his use is social and overwhelmingly important. Every man who works must dress for his work; and only in those primitive survivals—the military class, the ancient churches and their academic progeny, and the “leisure class” of still lingering feudalism—does the male still “carry ornament.” But our female—no longer the race type, but carefully maintained as “the sex”—has been false to the most inherent laws of her sex and adopted this essentially masculine function of sex-decoration. She it is, with us, who outdoes the antlered stag in her towering headgear, the buffalo in shaggy boa and tippet, the peacock in her flowing train. She it is who shines in spangles like a fish and flutters in borrowed plumage of the bird (the male bird). She it is—not he—who parades and performs in varied accomplishments, in all the elaborate arrangements offered by what we call “social opportunities,” in order to attract the male of her species, who is her means of livelihood.

That she should do this is “natural” enough. Nature is no stickler for details; she must support life at any cost, and is as willing to preserve a patient little father sunfish guarding the nest of eggs as a tomcat who eats kittens. The woman must live, and since the man feeds her she must at all costs secure the man. This is not from mere sex-attraction. It is the slowly evolved machinery of self-preservation.

The superior splendor of the human female and its unquestioned efficacy give only another proof of nature’s power of adaptation. But it is most obviously unfeminine, being an essentially male characteristic in all species. And whatever else it may be, it is above all things not *modest*. To call a kind of dress whose main feature is announcement and display “modest,” to call a kind of exhibition proper only to the male—the male of the lower orders—“feminine modesty,” this shows the marvelous capacity of our minds for entertaining paradoxes.

If women’s dress concealed their sex instead of proclaiming it, that would be far more “modest.”

We have not yet learned that Humanity is a relation far higher than sex, and that dress suitable for the service of hu-

manity need not carry any other label. We call all the world’s working costumes “masculine,” and therefore immodest for the woman to put on.

Any special costume necessary to a special human process is human dress, and not a mark of sex. Joan of Arc in armor was not immodest; she was a soldier and showed it, instead of being a woman only and intent on showing that. A diving costume has no sex; its leaden shoes and heavy helmet are necessities of its use; it matters nothing whether the diver is a man or a woman.

When women work in mines, as they do sometimes, as with the pit girls of England, they necessarily adopt what we call “men’s clothing.” It is only men’s clothing because men work in mines. Trousers are not masculine; in China and Turkey they are feminine. Our mistake is in fastening the idea of sex upon purely human garments and calling this feverish consciousness “modesty.”

For a third paradox let us follow some of the manifold gyrations of this modesty idea among what we call “feminine” costume.

Here we have in the first place the naked savage, and then the first simple covering *à la* Adam and Eve.

Then begins a long, an endless line of most amusing distinctions.

In one place we find it “modest” for a woman to cover her face—glaringly immodest to let the face be seen. It is said even of some African tribes that a woman found unveiled will “snatch her last garment off and cover her face with it.” She is perfectly modest—according to her education.

Again, we find that her whole body must be so swathed and cloaked that its damaging outlines may not be seen. (Follow, if you can, the line of thought: *a.* A woman’s outlines and proportions must not be seen because it is immodest to show that she is a woman. *b.* Therefore she must so dress that the most distant observer may know that she is a woman!) It seems rather unfair to call that “thought,” doesn’t it?

Then there was the notion that her hair must not be seen. In Breton, for instance, a close cap is worn, covering all the hair, and a Breton girl is more ashamed to have her hair uncovered than to go barelegged to the knees.

Among sturdy German peasant women we see often their strong, muscular legs to the knee nearly, so short are their petticoats, but they are modest women.

If their petticoats were a foot shorter they would be overcome with shame, or if their necks and shoulders were uncovered.

In England, however, it is the general custom among the upper classes to expose the neck and arms—the chest and shoulders—in the evening!

This is a subtlety within a subtlety, involving many considerations of pressing perplexity. How can a costume no more than warm enough during the day be changed for one exposing the throat and chest at exactly the time when "evening dews" and "night chills" and all that sort of risks are coming on? Yet it is done, and with no apparent ill result.

That any part of the body may be hardened by exposure is easily understood, but how it can be covered part of the day and exposed part of the day and adjust itself to these changes is indeed remarkable.

The girl who is accustomed to spend her day in a high-necked dress and go out in the evening with so much of her white body visible is just as modest—in her own feeling—as the girl who wears a high-necked dress all the time.

There was a day, not so long past, when our demure grandmothers wore neckless and sleeveless dresses all day—and they were modest, too.

There is nothing more conspicuous and alluring in a shoulder and elbow than in a knee and ankle; yet these modest girls with bare shoulders would be crouching and crimson with outraged modesty if their knees were bare, too.

Again, in the hard work and patiently acquired skill of the ballet dancer there is no shame for the clean-built, sinewy leg she shows so freely. If you study its sharply defined muscles and balanced strength you find human beauty to admire; but it does not proclaim sex. The overplump and pitifully feeble limbs of the high-heeled toddler who so holds her draperies as to emphasize every line and curve are far less "modest" than the straightforward tights of the dancer. But we call the shimmering folds meant to attract the eye, the play of curves un-

der the soft fabric, the whole self-conscious and sex-conscious attitude of the glowing girl, "modest;" and the cheerful, commonplace circus rider, who thinks no more of her legs than does the fisher girl, or than the English girl does of her bare arms, "immodest."

Thus vague are we in our ideas, and thus complex and variable is this confused bunch of contradictions known as modesty.

Suppose we untangle them for once and state them thus: There is (a) the natural modesty of youth and inexperience, of any recognized inferiority; this is a just perception of fact; a good quality. There is (b) sex-modesty, proper to the human race, male or female, which is a feeling of concealment and privacy in all their relations: a good quality. There is (c) "female modesty," so called, which is by nature the passive attitude of the female, her inconspicuous appearance, her tendency to withdraw, and so further attract the male. This is a good quality enough, but has really no relation to modesty. The demure withdrawal of the female is her form of sex-attraction and on exactly the same level as the blustering advance of the male. Both are right in their place; neither is "modest." Women as a sex have no occasion for the modesty allied to humility, for theirs is the mother-sex—the most important.

Women as human beings have occasion for this modesty owing to their patent inferiority. A proper modesty would recognize this, and a proper pride and ambition would set to work to change it. And women in their dress should recognize the glaring immodesty of continual advertisement of sex, and, as they become more developed humanly, should outgrow it. A self-respecting human creature has some work to do in the world and must have a costume suitable to that work.

No real beauty will be lost in this. Beauty, real beauty, is not insured by loud devices of ultra-feminine charms. The weird, fantastic, whirling flood of fashion has only a remote connection with beauty, and that not always. Human beauty goes with human use and under higher law than any distorted code of female modesty.

NEW YORK CITY.

# Yacht Racing Across the Atlantic

BY POULTNEY BIGELOW, LL.D.

[No matter how far inland any of our readers may be, they felt an interest in the triumph of America in the recent international yacht race across the ocean, and they will enjoy reading the experience of a passenger on the "Thistle," one of the contestants. Most of us have been canoeing with Dr. Bigelow in foreign waters, but this is the first time we have had an invitation to go yachting with him.—EDITOR.]

WHEN the owner commands and navigates his own boat, as does Robert Tod of the "Thistle," we have the ideal of deep sea yachting.

Any one with a long purse may build a boat and hire a professional cup lifter, but where does the sport come in under such conditions?

On the second night out from New York there had been some hard work in the way of shifting sail, and so all hands were called aft, the steward was ordered to bring the big whisky flask and the owner commenced to pour out a tot for each gallant tar.

The whole ship's company, including two passengers, makes only 25, and when I found our genial host was pouring the fiftieth glass I commenced to take an interest, and discovered that in the darkness the crew were revolving past him much as an army on the stage—passing along into the darkness and reappearing from behind the mainmast with splendid regularity.

After this Tod counted his tots.

To please Mrs. Tod he shipped a venerable first mate, whose atmosphere was that of deliberation. With such a careful assistant, thought his loving spouse, nothing but good could happen to the "Thistle."

She was right. This gentle mate was never allowed to do anything about the decks save such non-committal work as testing thermometrically the temperature of air and water; reading off the numbers on the taffrail log, playing with the sextant and going aloft with opera glasses in search of news. He was a pleasant addition to a tea party, but mostly in the way otherwise.

The skipper had little to do with his guests—these took their meals alone, our

host refusing to leave the deck or the chart room night or day.

Personally this would have used me up in a very few days. Dr. J. C. Ayre, my fellow passenger, told me that in the course of his long and active professional career he had never met with any one who could resist sleep so long as the skipper of the "Thistle." And after fourteen full days of sleeplessness he appeared to be as wide awake and fresh looking as on the day of leaving Sandy Hook.

One reason for this vitality lies in the fact that my host neither smokes nor indulges in wine of any kind; furthermore, he does not indulge in profane language, which many think is part of a sailor's necessary outfit.

As to this or that yacht winning the race—that is a matter of secondary importance.

The same wind does not favor all, and while the "Thistle" selected the most northerly route, through the ice fields, and lost, it is no reason why she might not have won over the same line a few days earlier or later.

The fascination of these long races is in the hard test which it gives to both boats and their crews. It awakens confidence in the sea as a mother of manly virtue—it increases our respect for our Viking ancestors, who pushed out into the great ocean in search of adventure, fearing nothing save inactivity.

When I left New York some of my friends pictured the race as a sociable journey that would resemble somewhat that of a man-of-war with a convoy, lazily jogging over the swells and occasionally offering us opportunity to lower a boat in order to take dinner with a neighboring yacht.

And, indeed, while I knew from some seventy crossings of this Atlantic that sails are scarce things on the horizon, still there was, it seemed to all of us, a fair chance of meeting with one or two of our competitors at some part of the trip.

But not once on the whole journey did we catch sight of a single one of our competitors.

Not once did we even sight a passenger steamer—and only once did we come near enough to any vessel for an exchange of signals.

We had several days of gale and sleet; of very heavy seas and fear of icebergs, but only once did we feel some nervousness, when we found ourselves in the midst of drift ice, with darkness coming on, the air and water close to freezing and the sea so thick with white caps that it was not easy to distinguish the ragged tops of sunken ice from the foaming of the angry waves.

Do you think there was ever a dull moment aboard? Not one. The hours run by as they do on shore when one is thoroughly interested in work and play.

The weather we had was unfortunate in so far as winning the cup is concerned; it was mainly westerly, but veering and of unequal strength—necessitating constant jibing and shifting of sail.

Where we had a right to expect good, strong wind, we had merely five or six knot weather; at other times we had gales so strong and seas so heavy across the Gulf Stream that we could not work our sails to full advantage. But this weather gave us an abundance of physical exercise and no man with red blood in his veins can remain inactive on a sailing craft when there is work at the halyards and sheets.

Our dear Doctor suffered keen disappointment—our men obstinately refused to break their ribs or split their heads, and so, for the whole cruise, he had to practice on himself for want of a patient. He came near to having a fine practice, but it was nipped in the bud by the second mate.

This is how it happened.

One of the quartermasters confessed that he had a bit of a stomach ache.

Doctor was delighted—came on deck with something mixed in whisky. The news of this reached the forecastle and, presto! each man in succession commenced to complain of analogous symptoms.

The second mate, however, checked the threatened run on the whisky supply by substituting castor oil, and after the first dose stomach ache disappeared completely from the forecastle.

The next race should be from Boston to Gibraltar by way of the Azores. This race from New York to the Lizard was to have come off in 1904 and would have been then run but for a strange series of misunderstandings.

The next contest of this nature may well be raised above all such possibility by being regarded as international in the highest sense.

Uncle Sam can do the starting in Massachusetts Bay, and John Bull will cheerfully, I am sure, welcome the survivors under the Pillars of Hercules.

New England is the home of the hardy fishing craft which furnishes us to-day the best type of the deep sea small craft suitable for such a contest. It is the nursery of American seamanship; it is the only part of America where the so-called "Protection" tariff has not yet wholly sapped away the life of the American sailor.

So here's a health to the gallant skipper of the "Thistle"—the man who not merely proposed the ocean race of 1905 but succeeded in making it real in spite of many obstacles.

Here's to the next race, to a longer race and increased entries.

And, above all, here's to more sport on the high seas—more fellowship 'twixt all who speak our language, and may the day soon dawn when the grand watchword of New England shall again ring in political conventions:

Free Trade and Sailors' Rights!

LONDON, ENGLAND.

# My First Success<sup>\*</sup>

BY EDWARD GRIEG

I WAS accompanied on the journey to the city by an old friend of my father's. We crossed the North Sea to Hamburg and after a day there continued by rail to medieval Leipzig, whose high, gloomy houses and narrow streets seemed to take away my breath. I was finally lodged there in a

a Saxon postal official, tried to comfort me: "Just think, my dear Mr. Grieg, it is the same sun, the same moon and the same good God which you know at home." It was kindly meant, but neither the sun, nor the moon, nor the good God could replace my father's departed friend, the last tie between me and home. But

EDWARD GRIEG

"pension," after which my father's old friend said farewell—and that was the last Norwegian word I heard for a long time. There I was, a boy of fifteen, all alone among strangers. Homesickness overpowered me; I went to my room, where I sat and wept continuously until called to dinner. The man of the house,

the spirits of a child change rapidly. Soon I was entirely cured of my homesickness, and, altho I had really no idea of what "studying" music meant, I was perfectly confident that the miracle would take place, and that after my three years' course I would return home a veritable wizard in the world of tone. That is the best proof of my naïveté, and of my utter childishness, and I do not wish any

<sup>\*</sup> This concludes the story of the great Norwegian composer, begun in our last issue.—EDITOR.

one to think of me at this time except as a child-student at the conservatory.

I was a child in all things, even to my clothes. I wore a short blouse with a belt, as all boys did at home, and, as may be imagined, my associates looked upon me with astonishment. There was one indeed, a violinist, who amused himself by taking me on his lap, which, naturally, reduced me to despair. Still this did not continue long.

I was admitted to the Leipzig Conservatory, however, and so was encouraged to feel that I must have musical talent, for that was the statutory requirement for entrance. This was naturally a great victory for me, for I had dreaded nothing so much as being rejected. And now to win first place among my fellows! What a conquest! And then the sympathy of the teachers! To hear words of praise from the teacher during a lesson; that was a delight to the youthful heart which far exceeded that produced by the plaudits of thousands in later life. At first, however, such delights were not for me; I was anything but the premier student at the Conservatory. On the contrary, I was terribly lazy at first. I remember still how when I had bungled a sonata by Clementi which had been forced upon me, my first piano teacher, the unsympathetic Louis Plaidy, suddenly tore the book from the rack and hurled it aside so violently that it flew through the air and fell in the furthest corner of the room. Since he could not perform the same feat with me he was satisfied to roar: "Go back to your room and practice!" I must confess he was right; but the punishment was very humiliating to me, for there were a number of others in the room. This episode, to say the least, was a doubtful success, but it was of value to me, for Plaidy's brutal treatment aroused all my pride. Since he allowed me to play nothing but Czerny, Kuhlman and Clementi, all of which I loathed as I might the plague, I soon came to a decision. I went to the director of the Conservatory and asked to be excused from Plaidy's lessons. My request was granted and I was indeed proud of the result. This helped me to get rid of some of my excessive diffidence and I became more courageous. It has been said of Plaidy that he himself had

a good technic and knew how to cause his pupils to acquire it. Whether it was due to my stupidity, my laziness or my antipathy to Plaidy, it is quite certain that he did not succeed in imparting any technic to me. His method of teaching was the most soulless that can be imagined. He sat close to the piano, the little, fat, baldheaded man, with his left forefinger held behind his ear, continually droning, throughout the exercise, the maddening repetition: "Immer langsam, stark, hochheben, langsam, stark, hochheben!" It was enough to drive one mad. And it sometimes happened, when the pupil had finished, that he would take his place. This took place, however, only under certain conditions, which I must describe. In these cases we pupils took great and suppressed delight, for we knew exactly when Plaidy would play and what he would do. Whenever a pupil brought either Mendelssohn's Scherzo capriccioso in E or his capriccio in B Moll, Plaidy would go to the piano and play the slow prelude with as many airs as possible. It has been said of Bülow that in his execution he showed the pedagog to the highest degree. Then what can be said of Plaidy? His playing was a shining example of his theories: "Langsam, stark, hochheben." This continual punction, if I may so express myself, this separation into small periods by commas, semicolons, interrogation points, dashes, etc., was the characteristic, and between them—nothing, not a trace of anything. It was, indeed, a pedantic hodge-podge sort of execution. But then came the delicious moment. The slow prelude was finished, the allegro should follow. But we knew exactly what was to come, for it was as certain as that twice two makes four that Plaidy would rise from the piano, and with assumed composure would say, as if casually: "And so on." One would think that a teacher in the Leipzig Conservatory should at least have the ability to play through the slow preludes of two of Mendelssohn's capriccios. And the poor man really thought that we did not see through him. It was utterly absurd. As I have already mentioned, tho, perhaps it was my own fault that I could not learn anything from Plaidy. There were pupils who by following Plaidy's

principles blindly showed astounding results. The most beautiful technic of all was that possessed by an Englishman, J. F. Barnett, who was a devoted follower of Plaidy. Laboriously and with untiring energy he applied it to an interpretation of Beethoven in a way which demanded our greatest admiration. Here is an episode which I cannot resist relating. One dark, winter evening, when Barnett was to play Beethoven's concerto in E-flat in the Gewandhaus (a great honor for a pupil of the Conservatory), about an hour before the concert, I had gone into the usually deserted Conservatory to find a forgotten music book. To my surprise, however, from one of the small classrooms I heard tones which seemed to come from a beginner, for the notes followed one another very slowly. The next instant it struck me that they formed a part of the allegro movement of Beethoven's E-flat concerto, not adagio, but played very much more slowly. I opened the door a little; there sat Barnett. He had had the courage to carry out the method to its most extreme limit, and that just before the public presentation. And I rejoiced with that amiable and clever artist in the results of his perseverance. A few hours later the allegro passages were given with the most beautiful clearness, and he won a brilliant victory. Here, as is so often the case, the words of Goethe may well be applied: "One is not suitable for all." As I have said, Plaidy did not suit me, for I required another kind of treatment. Better days were in store for me, however, when I became a piano pupil of Ernst Ferdinand Wenzel, Schumann's clever friend, to whom I soon became devoted. Naturally he did not play the preludes to Mendelssohn's capriccios, for he did not play at all. It was reported that once when young his memory had failed him at a public appearance; at any rate he could not be induced to play in public. He was a master in imparting his views, however, and he could explain things in an entirely different way from Plaidy.

Later I was promoted and had lessons from the celebrated Ignaz Mocheles. Under his influence all my laziness disappeared. Very many hard things have

been said of the teaching of old Mocheles, but I feel I must defend him warmly. It is true that he was simple enough to think that he awed us by abusing Chopin and Schumann at every opportunity, at which I secretly reveled. But he could play beautifully, and did, too, often for the whole lesson. His interpretation of Beethoven, whom he idolized, was especially excellent. This was plain, yet full of character without any straining for effect. I studied Beethoven's sonatas by the dozen with him. Often I would not play four bars before he would put his hands over mine and gently pushing me away from the stool would say: "Now listen how *I* play that." In this way I learned many small technical mysteries, and also to appreciate his soulful interpretation in all its details. It was reported at the Conservatory—altho, fortunately, I cannot speak from experience—that he once gave the following advice to his pupils: "Play the old masters as much as you can, play Mozart, Beethoven, Haydn and—me." I will not vouch for the truth of this anecdote, but relate it because it was on his advice I took up his 24 etudes op. 70 and studied them from beginning to end, a thing I do not at all regret. They pleased me and I did my best to satisfy us both. He must have noticed this, for he showed more and more sympathy for me. And it was the cause of a simple, but to me an important, success, for one day when I had played one of his etudes without a single interruption from him he turned to the other pupils and said: "There, gentlemen, that is what I call musical piano playing." How happy I was! During that day the whole world seemed radiant with brightness.

In the class in harmony, on the other hand, my success was not such as to make me vain. With E. E. Richter, at first, for the bases that were given, I wrote the harmonies that pleased me rather than those which were demanded by the rules. Later I could find themes enough for a fugue, but to arrange the theme so that it was in accord with the laws was beyond me. I started with the faulty premise that the essential thing was for my work to sound well. For Richter, on the contrary, the essential thing was to solve the problem correctly. And if

it was a question of problems, and not music, he was right. That was the point that was not clear to me at that time. I remained stubborn and held my opinion. I did not realize yet that here I must learn to restrain myself, to obey and, as is said in the preface of his "Harmonielehre," not to ask: "Why?" Fortunately we did not quarrel, he only laughed indulgently at my stupidity and with a "No, incorrect," marked the mistakes with heavy pencil lines. But there were so many of us in the class that Richter could not remain long with any individual. Dr. Robert Papperitz, from whom I had harmony lessons at the same time, did not hold me so strictly. The consequence was that I went so far from the "Landstrasse" that in my choral work I introduced chromatic runs wherever it was possible. One day he broke out: "Oh, those chromatics! You will become a second Spohr." Since Spohr in my mind was an academic pedant of the first rank, this remark did not please me. Finally I took lessons from Moritz Hauptmann, and I am grateful still to that kindly old man for what I learned from his acute and intelligent criticisms. In spite of his learning he seemed to me to be absolutely unscholastic. For him the rules themselves were nothing but the expression of the laws of nature. One episode which, in a weak moment, I might call a "success," I shall relate. Before I knew Hauptmann, I was not yet sixteen years old and still wore my childish blouse, I was honored by being asked to play one of my own compositions for the piano at the Privatprüfung (a kind of half-yearly examination which all students are required to take). When I had finished, much to my surprise, I saw an old gentleman rise and come toward me. He laid his hand on my shoulder and said: "Good day, my boy! We must be good friends." That was Hauptmann. And I could not help loving him from that minute on. Sick as he was in the last years of his life he still gave lessons in his house, the Shomasschule, Bach's old house. Here I was fortunate enough to learn to know him well. I recall him as he used to sit on his sofa in dressing gown and cap, his spectacles deep in my exercise book, which has preserved more

than one of the drops of brownish liquid which formed continually on his snuff-filled nose. He sat with a great silk handkerchief in his hand to anticipate the drops, but this was not always successful, and so my book caught them, and, indeed, still shows the traces.

At that time in the Conservatory there was a custom of doubtful value—perhaps it is still in vogue—which forced every student to take lessons in the same subject from two different teachers. In the piano lessons this was particularly unfortunate, since we had often to study two contradictory methods. I remember only too plainly how Plaidy not only made much of the results of his method as compared with that of Mocheles, but also abused Mocheles whenever he could. It was not pleasant for us pupils and I believe that Plaidy usually attained just the contrary end he sought to reach. He underestimated the powers of observation of his pupils, as is so often the case with people who have but little of that power themselves. In harmony the only difficulty with the lessons by different teachers was that we had much more given us to do than we could accomplish. This was especially true when we had to write complicated fugues with two and three themes for one as well as for the other. I suppose that more than one student did as I and showed the same piece of music to both teachers. That, by the way, resulted in another success for me. A fugue under the name of "Gade," which had found no commendation with Richter pleased Hauptmann so much that, against all custom, after reading it through and paying particular attention to the details, he cried: "That must be very pretty. Let me hear it." When I had finished he said, with his mild and kindly laugh: "Very good, very musical!"

During my last year at the Conservatory I had lessons in composition from Carl Reinicke, who had just assumed the position as leader of the Gewandhaus concerts and teacher in the Conservatory, taking the place of Julius Rietz, who had gone to Dresden. As an illustration of what happened during these lessons, I will relate one of my experiences. I reported as one who had not the slightest idea of composition, nor of

the technic of string instruments, and was immediately asked to write a string-quartet. I had the same feeling as if the porter N. N. had suggested the thing to me, for it seemed so utterly absurd. I could not but think of my old nurse, however, who, when she asked me to do something which seemed impossible and I had answered: "I cannot," would say: "Leave out the 'not' and take hold with both hands." This joke which had encouraged me so many times in the past, times, indeed, which were fondly remembered, encouraged me also now. What Reinicke did not teach me I looked up for myself in Mozart and Beethoven, whose quartets I had studied industriously of my own accord. I finished the work thus in my own way, and when the parts were transcribed, it was played before the class by some of my fellow-pupils. The director of the Conservatory suggested its presentation at the "Hauptprüfung" (a public exhibition of the best student work), but Ferdinand David, the pre-eminent violinist and teacher, who happened to be present, held another opinion. He drew me aside and gave me the good and well-meant advice not to allow the presentation: "People will say it is the music of the future (Zukunftsmusik)," he said. In this, however, he was wrong, for it had no trace of the "future" in it, but was quite in accord with that of Schumann, Gade and Mendelssohn. As the work was decidedly mediocre, however, as I soon realized, I was very glad that David prevented its presentation. I only wish now that this quartet had been consigned to the flames, as so many others were at that time; but, unfortunately, it was not. It exists still somewhere in the world, but I do not know just where. It was a friend who was interested in my attempts at composition who saved it from the fate of the others. He had a manuscript score of Schumann's piano concerto, which at that time was only published in the form arranged for the piano with the orchestra. "I will give you my score of Schumann's concerto," he said to me one day, "If you will give me your quartet." It was impossible for me to resist this tempting offer, so the exchange was made, and I am sorry to say that my un-

successful youthful work is now somewhere in Southern Europe.

After the negative "success" of my first string-quartet, Reinicke said to me: "Now write an overture." I, who had no idea of orchestral instruments or orchestration, I write an overture! Again I thought of the porter N. N. and of my nurse. I set to work again, however, with all my power, but before I had gone very far I was completely at sea, and could get no further. It seems incredible, but there was no class in the Conservatory where a fundamental knowledge of these things could be obtained. It is no wonder then that connected with these lessons there was not even an apparent success. It was fortunate for me that I was able to hear so much good music in Leipzig, especially orchestral and chamber music. That prevented me from suffering from the lack of instruction in composition technic. That developed my imagination and musical judgment to the highest degree, but it produced the greatest difference in my desires and my capabilities, and I am sorry to say that this difference was the result of my sojourn in Leipzig.

It may seem difficult to find the material for a success in what I have related. For me, however, it is not. I observed very quickly that everything was not as it should be and so withdrew more and more into myself, for I wished to learn something more than that which they taught or attempted to teach in the lessons. This idea that I wanted something else was a great stimulant to me and gave me courage to work by myself. At first I had many disappointments; and I cannot deny that it hurt me to see how I was distanced by my associates, who made great progress and succeeded so well. I remember especially several young Englishmen who, partly from their own industry and partly from their ease in the assimilation of knowledge, did things which discouraged me. Among these was Arthur Sullivan, the composer of the "Mikado," who later became so well known; the pianists Franklin Taylor and Walter Bache, that untiring defender of Liszt in England, Eduard Dannreuther, who also was one of the first to introduce Wagner there, and who was a great figure and a masterly pianist;

and, finally, the admirable John Francis Barnett (mentioned above), who still teaches in London. Sullivan distinguished himself immediately by his talent for composition and by his excellent technic in instrumentation, which he had acquired before his entrance to the Conservatory. It was during his student days that he composed music for Shakespeare's "Tempest," a few measures of which he wrote in my album in such a routine, fixed style as to recall one of the old masters. Altho I did not see much of him, one happy hour with him I shall not soon forget. It was during the rehearsal of Mendelssohn's "Paulus." We sat together and followed the music with the score. But what a score! It was Mendelssohn's own manuscript which Sullivan had borrowed from Conrad Schleinitz, the director of the Conservatory, and intimate friend of Mendelssohn. With what devotion did we examine the score, page by page! How we admired the clearly written notes, which corresponded so well with the ideas!

The very mention of the name of Schleinitz recalls events which also had much to do with the formation of my character. When I first came to Leipzig he was an old man, for whom I had the greatest respect. It soon became clear to me, however, that he was not popular, altho personally I never had any cause to complain of him. At first I felt that he did not like me and it seemed to me that he avoided me. This I attributed to the fact that Plaidy had probably spoken ill of me to him. I had not been in the Conservatory six months, however, before something occurred which raised him in my opinion immensely; and from that time on he was always very kind and obliging to me. The occurrence was as follows: One evening several of us were late in arriving at the Conservatory for the weekly concert, and, according to the usual custom, remained without until the first piece was finished, when we entered all together. Now Schleinitz had a weakness for fatherly lectures whenever opportunity offered, so no sooner had the last note been struck than he arose from his place and asked every one to remain seated as he had a few words to say. There was a general feeling of suspense and astonishment. His speech had no

other object than to reprimand those students who had come in late, and he concluded with the startling opinion that the peculiarity of those who were late was that in general they were the worst students. This "success" was entirely *too* negative. Such a mortification was more than such a young hot-head as I could stand. The next morning at nine o'clock I knocked at the director's door, and was told to enter. Without circumlocution I said plainly that his address was without reason and was also unjust and that I for one did not propose to be so treated. He became perfectly furious and standing up pointed to the door. But I also had my fighting blood aroused and said: "Very well, Herr Direktor, I will go, but not until I have said what I came to say." At this moment the most astonishing change came over Schleinitz, who, walking to me, patted me on the back and said in a low, sweet voice: "Now that is very nice that you are so jealous of your honor." This "success" I cannot deny. After this incident Schleinitz changed his attitude toward me completely and I knew that I had won his friendship forever. We became the best of friends and he could not do enough for me. An example of this I must relate. One winter day, when the post with my usual remittance from my far-away home had not yet arrived, I was forced to pawn my watch for the first and fortunately the last time in my life. In some unknown way Schleinitz found this out, and sending for me forbade me ever again to do such a thing, but whenever I needed any help to apply immediately to him. A success? Yes, indeed, a moral success, and one which had a good effect upon me. And it was a good action on the part of Schleinitz, which deserves mention besides the bitter criticisms on his reputed moral weaknesses, of which so much has been heard. I would have thought it but natural if neither the director nor the teachers of the Conservatory had shown an interest in me, for during my three years I did little which would promise much for the future. For this reason I wish to add here that when I have blamed the Conservatory in various ways, and also the persons in it, I look upon it as due primarily to my own disposition that I left

the Conservatory as stupid as when I arrived; for I was a dreamer and without any knowledge of the world. I was slow, uncommunicative and anything in the world but docile. We Norwegians develop as a rule too slowly to show at eighteen what we are really capable of doing. Whatever it may have been due to, I did not then know myself at all; the air of Leipzig did not awaken me. But a year later, when I went to Denmark, my eyes were opened and I saw a world of beauty which the fog of Leipzig had rendered invisible to me. I had at last found myself and overcame with the greatest ease the obstacles which in Leipzig had appeared to me insurmountable. My imagination, freed at last, produced one great piece of work after another in a short time. When my music was first designated by the critics as affected and odd, even that did not bewilder me, for I knew what I wanted and steered straight toward the goal that attracted me. Before closing, however, I must once more return to the days at Leipzig. It will certainly be conceded that I have not flattered myself in the picture of my attendance at the Conservatory. I must not make myself appear worse than I was, and so will add one other incident before closing this article, which may have the effect of rehabilitating me in the eyes of those who have certainly become familiar with most of my "successes."

For this reason I wish to relate one thing which may properly be called a success. It was at Easter time, 1862, just before I left the Conservatory, that I had the honor of being one of those chosen to appear at the public "Prüfung" in the "Gewandhaus," where I played several piano pieces of my own composition. Heaven knows they show the hand of a student, and I blush even to-day at the thought that they

were published, and figure as Opus 1. It is a fact, notwithstanding this, that I succeeded in giving pleasure and was encored a number of times. That was finally a success and one which I cannot deny. And yet to me it did not seem to have that meaning. The audience consisted principally of guests, friends, teachers and students, and under these circumstances it was not difficult for a blond youth from the Far North to give pleasure.

And now I ask: Where in all this that I have related is the first success to be found? The reader has certainly read between the lines that for me and my development there is not a single thing which may be considered as an answer to the question. I cannot point my finger to my first success and say: Here it is. And why can I not? Because it is something abstract. From what has been said above the acute observer will certainly see what I have aimed to do. As I said in the beginning, it was my intention to leave the reader himself to answer the question. But perhaps I have overestimated my capability; so it may be as well to give the key to the puzzle by summarizing all in a few words. The power within me by which later I was able to shake off the burden which was the result of an insufficient, unbalanced and one-sided education at home and abroad, and which threatened to deflect my nature from its proper sphere, that was my preservation, my good fortune.

And when I became conscious of this power, when I began to understand myself, then I had attained what I consider my first success, for it was vital to my life. My childhood, the sorrows and joys of my first years of study, my disappointments and triumphs have all united to form this one great success, for without them, indeed, I could not have attained it.

NORDSVAND, BERGEN, NORWAY.

# A Family Trek to the Yellowstone

BY MRS. N. E. CORTHELL

[One of the most original and delightful vacation trips we have heard of recently is that of a Wyoming mother who with her seven children, the eldest son barely sixteen, traveled in a wagon from the southeastern part of the State to Yellowstone National Park in its northwest corner, a total distance of about 1,200 miles. They lived out of doors two months, and crossed mountains and deserts where for many days they saw no one. We have asked the enterprising little woman who planned and carried out this unusual expedition to tell about it, for it is very encouraging to parents who are wondering how they can give their children a cheap and healthful vacation.—EDITOR.]

GLADYS

MIRIAM

Nearly half a lifetime I have lived in Laramie, with all the while a great longing to see the wonders of the Yellowstone—in season, out of season, when the house was full of babies, even when it was full of measles. As the older children outgrew marbles and dolls I conceived the bold idea of stowing them all in a prairie schooner and sailing away over the Rocky Mountains, deserts, forests and fords to the enchanted land five hundred miles away.

My husband offered strenuous objection of course to the crazy project, but could only fizz and fume and furnish the wherewithal, for the reasons advanced he found irresistible; such an ideal vacation for the children—a summer out of doors seeing their native State! A chance for their botany, geography, zoology, to be naturalized. To be drivers and cooks would throw them on their own resources somewhat, a valuable education in itself. So economical, too! Such a fine opportunity for stretching of legs and lungs, with the Park at the end! Reasons to turn a man's head, you see, so when the boys wrote along the wagon top "Park or Bust," that settled it, and we started July 4th, 1903.

The first day out was glorious, so we camped without tent or stove, for the small boys were "heap big Injuns," who scorned the ways of civilized folk—in fair weather. They whooped along on the warpath, gravely examined every old trail, read the sky, sent the "stinging fatal arrow" after jackrabbits, clamored for pioneer talks, then rolled up in blankets around the campfire with only the stars overhead.

From Laramie down to the bridge where we made our first camp, a distance of thirty-three miles, there was one road only; beyond the bridge there were a dozen. Which one led to Little Medicine crossing, our most direct route to Shirley Basin, we didn't know and couldn't find out, for one may travel a whole day beyond the bridge and not see a house or an individual.

So we took the wrong road, went out of our way ten miles, and had to make a dry camp at Como, arriving in Medicine Bow the third day at noon. From here we drove north over the same road among the same Freezeout Hills, through which the "Virginian" piloted Owen Wister on his way to the Goose Egg Ranch, reaching the old Trabing place about four o'clock. It was apparently abandoned, save that freighters were stopping here this one night. They courteously offered to camp outside and give us the house, but we were afraid of strangers, afraid of everything, in fact, and after a hasty supper moved on and spread our tarpaulins on the bare plain, arriving at the home of my friend, Kirk Dyer, the next morning.

I told him of my foolish suspicions—that the freighters, having lost their horses, might have designs on ours, etc. He rebuked me sternly, and read me such a lecture as I shall never forget.

"Country people are honest," said he, "and you must take it for granted. Away from the railroad this far, you are safer than on the streets of Laramie, and you will get a square deal everywhere. Trust people and don't harbor suspicions."

Such a delightful day as the children spent riding horseback and eating Mrs. Dyer's cream biscuits. We turned west from here and camped in Shirley Basin, just one hundred miles from home and five days out.

So far the trip had been "better than my dreams," as the "Virginian" would say, tho in dreams I had traveled in automobiles. The next day was different. We were driving gayly along through a fine meadow, when suddenly the wagon sank in mire. The horses tugged to pull it out, the kingbolt snapped and off they walked, with the front wheels. My driver-boy quietly stepped over the dashboard and walked off after them.

For one despairing moment I thought the end of all things had come when my wagon parted in the middle. Noting my forlorn face one youngster concluded it was time to laugh, for he exclaimed:

"Gee, mamma! This isn't a bit exciting. The horses ought to have run away and smashed a few kids." Seeing how much worse it might have been I thanked my lucky stars and calmed my fears.

Now, Shirley Basin is the land of the Good Samaritan, where every ranchman is your friend and neighbor, who pulls

you out of the mud, mends your kingbolts and fifth wheels, agrees with you in politics, praises your husband, and treats you to ice cream in the evening, so the accident makes pleasant memory.

After circulating around and among Seminole and Ferris mountains, we finally wound up in Alcova, exactly a week from home. This is where the Platte River flows through a mountain cleft and where the "Pathfinder" dam is to be made which will flood Platte Valley and the Valley of the Sweetwater.

Now I must tell our troubles. We had forgotten the pocketbook when we started. Imagine my predicament. A mother totally unused to business or cares outside her own domain, 150 miles from home, with seven children and two horses to provide for and not a cent of money? Fifty miles from telephone or telegraph! We discovered our loss twenty miles out from Laramie, but just then met friends driving in, who promised to have it forwarded promptly; and we went serenely on our way into this dilemma.

We were put to our wits' end to get oats, as yet our only necessity. The driver suggested that we trade off a hammock; daughter thought we could

Indian Squaws Building a Tepee

A Miner's Cabin Almost on Top of Snowy Range, Wyoming

better spare bacon ; being a hot day, little Tad generously offered his overcoat as a basis of trade, and the driver and I walked over to a ranchman's house nerved up to try a bargain until—we saw the man, who was a perfect stranger. Then we realized it would be like asking the President to swap a sack of oats for a side of bacon. No, we must put dignity into our need, so quaking like two criminals, I ask Mr. Blank for oats and to “send the bill to my husband, please.” A fleeting, quizzical flutter of his eyelid brought out the wretched blunder of the pocketbook.

“But, my dear madam,” said he, “you must not be traveling with all those children to care for and no money.” Then

he brought from his desk a generous sum, saying, “Your husband can send me his check when convenient.” My troubles were over, but was ever a deed more chivalrous “in days of old when knights were bold?”

Next morning we drove into the ruts of the old Oregon Trail at Independence Rock, where the trail finds the Sweetwater. This hill of granite, standing isolated on the plain, was a prominent landmark on the overland route. The annual rendezvous of fur traders, trappers and Indians occurred here. The Mormons left their names on it. The Whitman wedding party sojourned here, and here a great celebration took place July 4th, 1850, at a rendezvous, when

General Fremont was carried to the top and made a speech. This rock is covered with thousands of names, one as early as 1819.

Everybody is growing handy, even expert, in camp work. The boys can skin a cottontail or dress a sage hen equal to Kit Carson himself, while daughter can prepare a savory dinner or pack a mess box good enough for an army general. The children are eagerly interested in everything they see, hear or can catch. Tad announces that we have seen nine horned toads, caught six, mailed three and have two packed in little tablet boxes with which to surprise (?) the chum at

home. Query: Where is the medicine that was in the boxes? Well, if they spill the tablets, they will have to drink sage tea when sick. Marvelous cures of many kinds in bitter sage.

The immensity of Wyoming is beginning to dawn on them. They hunt, swim, explore, and so learn to enjoy the special, individual flavor of each locality. But all grow tired of the illimitable sage—one million acres after another. Why do these vast plains bear one species of wood only, and that so abundantly?

We are over two hundred miles from home now and approaching the Beaver Hill dragon. We have heard so much

Cody Park Road, Twenty Miles Below Junction of the Forks of Shoshone River

about it, tho, we are braced for trouble. With a strong steel brake and a seventy-five-foot picket rope fastened behind for the children to pull back on, and me boosting on the underside to help the wagon over sidling places, out on that steep, windy comb, we came down safely, tho the stage coaches had blown over three times the week before.

A rare stroke of luck! The Shoshone Sun Dance was on the tapis—in a tepee as we drove into Fort Washakie. Fifteen hundred Indians were gathered here for the solemn ceremony. There was a large tepee on a common surrounded by quite a village of small ones. Half of this big tepee, or dance lodge, was filled with stalls made of green branches. The other half was occupied by tom-tom players and singers.

In each stall were two young braves dressed in modest loincloth and much paint, who in turn, while blowing a whistle, danced to the central pole and back in time to the music. Thus while sixty or more young men were entered for the dance, half alternated with the other half every fifteen minutes. This they continued from Tuesday night until Friday morning, almost without food, drink or rest. As an added test of endurance a great feast was going on outside all Thursday afternoon, which they must smell but not taste.

The Shoshone Indian reservation is as large as a good sized Eastern State, and for seventy miles we had the whole country to ourselves. When the loneliness of the wide, treeless plains grew oppressive the children sang "Good Old Summer Time," or else they made "fudge." They sang from pure joyousness, for this free outdoor life is sweet to nature's own boys and girls, school-housed and book-ridden all winter. Each is a different kind of plainsman from the rest; one gets things with his gun, one with his hook, one with his bow, one with his hands. The latter is the naturalist, of course, engaged just now in switching a couple of water snakes into a beer bottle, with which he proposes to ornament his temporary totem pole. Every time the wagon stops, up springs a tiny dance lodge, a tom-tom is improvised, and Indian ki-yis revive the weary plain.

To-night, July 26th, we feel like a

band of heroes. We forded Dinwoody, the ugliest tributary of Wind River. The water didn't flow quite over the horses' backs, because they are big horses. Yet it wasn't the deep water alone, but the swift mountain current, and huge, slippery upsetting boulders that made the ford dangerous. We forded the Wind and its tributaries eleven times after getting above its deepest water, and then—Dubois.

Here between the Indian reservation and the forest reserve is a narrow strip of Government land, standing on end, along the upper canyons of the Wind, where young settlers are trying to make homes. The choicest locations were taken up long ago, one of them by a ranchman named George B. West, said to be the original of the "Virginian." He wouldn't own up that he changed the babies, but did go so far as to say that he attended that particular dance on the old Gallatin ranch. Like the "Virginian," he will talk on any subject except that of his own exploits.

Dubois has the distinction of being farther from the railroad than any other post office in the country, so they say. It is two hundred and fifty miles from here to Rawlins or Casper, and over four hundred to Laramie.

The responsibility, the anxiety of the long journey, are laying hold of me until I'm nearly overwhelmed. Four hundred miles from home! And only one letter! What may have happened in all these weeks? Suppose a child should sicken! There's one at home would never forgive me should any of them be injured. Will the horses hold out? The food? Already two spokes are broken and wrapped together with baling wire. My bold driver says we shall go on if we have to drive into the park with *every* spoke bound up in baling wire. And the dangers anticipated did add a certain zest. "Give ma something to fret about and she's happy," observed our twelve-year-old philosopher.

After the fords, our problems narrowed to a question of food, with the continental divide looming in the distance. How to cook enough for all those hungry children and still get ahead fifteen or twenty miles a day, where bread could not be bought. The capacity of

my oven was two tins of twelve biscuits each. These I filled three times every night when dark overtook me. That made seventy-two biscuits, three apiece every meal, but those boys wanted ten each—and there was the problem.

The final spurt that brought us over the divide was strenuous, but repaid us grandly. It is fine to climb a thousand feet to look about you, but when you have mounted ten thousand feet to gaze abroad over the crest of the

of the boiling, walloping vats of mud; that it was delicate rose, emerald green, or heavenly blue mud did not reassure me in the least. But the children simply laughed. Even the youngest pertly informed me he had not come all the way to Yellowstone Park to fall into a mud hole. Still the horrid smells and the horrible groans and growls, and the gaping mouths clear to Hades aroused such emotions of terror in me that in sheer desperation I hurried over to the lake.

Alcova on the North Platte River Just Where the "Pathfinder" Irrigation Dam Is to Be

continent, the Atlantic slope behind, the Pacific slope spreading before you in range after range, with intervening valley, and gorge, and river, and lake, with the Grand Teton gleaming over all, magnificent, inspiring, your soul is filled with exaltation.

Yet it is a pokerish kind of pleasure trying to enjoy the ravings of the demons from the bottomless pit at the "thumb." As for me, I was kept busy counting the children. Every time one of them moved I was certain he would stumble into one

From here we telegraphed the anxious one and rested in the sweet peace that reigns over this corner of the park. And then, the Grand Canyon of the Yellowstone! Mere words cannot picture this wonderful vision, so I will only say that after we had spent a day sight seeing it seemed almost sacrilegious in me to return to camp, and go to baking beans; but we needed a change from Van Camp's, so there was nothing else to do. I wouldn't speak of it now, only that was how we came to have a visit from a bear.

The beans were not done at bedtime, then I put in more wood, thinking they would be just right for breakfast.

About midnight there was a great clatter of falling stove. Sure enough, a bear had tipped it over trying to get my beans. He was trying so hard to get the oven door open that he never noticed our excitement. Not until I went out and threw things at him would he give up trying to find the combination of the oven door and go away, and not until then did we hear a peep from Shep. We never thought of being afraid. But I used all my ingenuity in hiding the bags of bacon and sugar so he wouldn't get them. The next forenoon we spent taking a long look into the canyon. On our way back we stopped at Canyon Hotel, where we received our wished for message from the father of the family: "Will meet you at Mammoth Hot Springs August 8th." August 8th was to-morrow, and Mammoth thirty miles away. The mere thought of seeing our beloved so soon lent wings to our feet, new life to our hopes and joys, so that surmounting the divide which separates Yellowstone from Norris Basin was not so much work as needed exercise for holding us down to earth. The prospect of losing half my responsibilities sent my spirits floating skyward.

We arrived in camp five minutes ahead of the stage from the railway station at Gardner. How we rushed to make camp homey! The driver unhitched and had the horses feeding instantly; daughter, Tom and babe set the tent; Tad brought wood, Glad water, and Mim speedily had a roaring fire; while I popped my biscuits in the oven, sliced bacon, seasoned corn, opened a jar of jam and a can of tomatoes, and set the coffee simmering. Daughter watched the fire, Glad spread the cloth, Mim tidied the mess box, and the boys put the bedding to air in the hot sun. Then we all had time to primp a little, the while wondering what father would bring, for shoes and hats had seen hard service.

But he never minded our weather-beaten appearance, tho we had been roughing it five weeks, having traveled just six hundred miles; we all looked good to him, and the wonderful "Springs" reflecting the joy of the oc-

casion gleamed in the beautiful tints of the rainbow.

Now a new spirit has entered camp. The man of business has come to take his family home. We have to hurry. Oats are increased three-fold and thirty miles our speed. Then, ho! for the geysers! The Black Growler, a hissing, hideous monster we admire for his titanic and satanic power, but hastily pass on to cool, solid ground.

Like everybody else, we loved Old Faithful and the Morning Glory, we feared Excelsior, we admired the Giant, Bee Hive, Punch Bowl and a hundred other yawning chasms and smiling springs and spouting geysers. But the horrible rumbling as if an earthquake were imminent and the smell of brimstone made me eager to get my brood into the valley of safety beyond the Yellowstone.

We left the Park for Laramie over a new road recently completed by Captain Chittenden, through Sylvan Pass and Shoshone Canyon to Cody. This is the crowning joy of the trip. The park swarmed with people. Wherever we pitched our tent there hundreds had camped before us, to say nothing of the crowded hotels and Wylie tourists. But here in the heart of the mountain forest surely we are the first white woman and children to go over the trail, to fish in Sylvan Lake, to climb Grizzly Peak, to camp within the sacred haunts of "Wahb," once lord of the Wind River Range.

Altogether we traveled twelve hundred miles, stood the journey well and never, never had such a wonderful, delightful summer. One must love the life to say that, must crave the outdoors and thrive on it. The sand was never too deep, the waters too high or the way too long. Every obstruction made the goal a dearer prize and we have lived our precious summer over and over.

Cold, thirst, hunger, fatigue, loneliness, I wanted the children to feel them all deeply, that their sympathy with the deprivation and isolation of the noble hearted army who blaze the way for civilization may be keen, true and sometimes helpful.

It is a trip anybody can take. It cost us only \$25 apiece for the two months

Where the Holdbacks Held Back. as Sketched by One of the Children

outing. We met people from Kansas and Salt Lake traveling just as we were. We had \$15 worth of medicine along and never took a dose. The ammonia bottle was broken, also the camphor. The children emptied the witch hazel out in order to put specimens in. They plastered the arnica salve on the pony, and the dog ate the cold cream, and we shared our eight bottles of mosquito dope with ranchmen

where we stopped. The wagon created some amusement on our arrival, for it bore the inscription, "July 4th, *Park or Bust*" on one side, and "September 1st, *Park and Busted!*" on the other. The children know their State as no book could teach them, and will have lifelong memories of the grandest scenes the world can produce.

LARAMIE, WYOMING.

## The Russian Crisis

BY FRANCIS CHARMES

[The author of the following article represents the Department of the Cantal in the French Senate. Some years ago he was a member of the Chamber of Deputies. He has held high position in the French Foreign Office and has long been foreign editor of the famous *Revue des Deux Mondes*. He is an authority in Europe on foreign affairs.—EDITOR.]

IN France, more than anywhere else perhaps, deep interest is taken in the Russian crisis. This is very natural, as the two countries are friends and allies. For some years past they have been in the habit of counting on one another. Recent events in Russia may have somewhat weakened the availability of the alliance, but it is still warmly cherished by the vast majority of the French people. This fact stands out clearly in the text of the declaration read before Parliament the other day by the new French Cabinet and in the speech of M. Delcassé, when, on the same occasion, he answered a

socialist deputy who called the Czar "an assassin." In fact, all reflecting minds in France feel that if it had not been for the Russian alliance, which re-established in Europe the equilibrium of forces, the recent reconciliation of France with England and Italy could not have been brought about. The value of these reconciliations, now recognized on every hand, is greater to-day than ever before. It might seem that these consequences of the alliance once having been brought about the alliance itself might be regarded as less indispensable. But it is held, on the contrary, that the efficacy of

this active and beneficial cause has not yet been exhausted. Notwithstanding the domestic troubles and the checks in the Far East, Russia is still a very important factor in European politics. If anybody doubts the truth of this assertion you have simply to turn for its confirmation to Germany and notice what she is doing to get into the good graces of Russia in the place occupied by France. This proves that in spite of her disasters Russia still stands high in the opinion of the Powers. Never has German diplomacy been more active in the direction of St. Petersburg than at the present moment. Many proofs of this statement might be given, but this would take us too far away from the real subject of this article — viz., the interior crisis of the Russian Empire.

This crisis, which came to a head toward the end of January, was due to two sorts of causes, one of which is momentary and the other permanent. The first springs from the war now going on in Manchuria and the other has its origin in the material and moral situation of the country. In the paragraphs which follow I propose to give especial attention to the latter. But it is beyond doubt that the military disasters have added acuteness to the interior troubles. Russia knew quite well her home shortcomings, but she imagined that she was almost invincible abroad. She counted on her weight and mass to crush everything that stood in her way. So when she found her tendency toward expansion stopped by a little people whom she despised; when she suffered the cruel humiliation of being beaten by Japan; when she per-

ceived the vices of her administration and her government, she felt more keenly than ever before those other evils, which now become intolerable, and the country demanded reforms. To-day there is but one opinion on this point throughout all Russia—something in the way of reforms must be granted. The cry may be somewhat stifled for the moment, but it was heard plainly a few Sundays ago; every throat shouted it, and it is highly probable that, in spite of the energy of the present policy of repression, it will be heard again in the near future.

But there is one fact in the situation that is not rightly understood: Of the 120,000,000 Russians how many take any interest in constitutional reforms and see therein a panacea for the ills of the present? A remark on this point, attributed to Prince Mechtchersky, is not devoid of truth: "The Empire is composed of 118,000,000 of men who do not give a thought to constitutional reforms," he is said to have repeated to

SENATOR FRANCIS CHARMES

a friend, "and of 2,000,000 who are in a condition to grasp the subject only a small portion pay any attention to it. What is the good, then, of wasting time on this head?"

My reply to this statement is that it is by no means a waste of time to consider this subject of constitutional reform; quite the contrary; for all those who speak in Russia speak of this and of nothing else. But it must be admitted at the same time that the vast majority of the Russian people do not think on the subject and say nothing about it. They are contented to go on suffering in silence. The misfortune is that they

really suffer very much and that this suffering is on the increase. The consequence is that there exists in Russia a general feeling of unrest, mingled with irritation, which shows itself in the enlightened circles by a feverish thirst for reforms and which reveals itself in the lower classes by suffering which is beginning to be borne with less resignation. This state of things produces a very dangerous situation.

The worst sore on the Russian body politic is to be found in the country districts, and there it is that it would be best to first apply a remedy. But I have not the space here to go into this agrarian subject fully. Suffice it to say that since the giving of freedom to the serfs more than forty years ago the peasant class has been kept under restraints of various kinds which prevent them from enjoying the provisions of the common law of the nation. This freedom of the serfs was only a half measure. The peculiar organization of the *mir*, or municipality, and the collective ownership of property, which renders tenancy uncertain, as the land changes, or may change, hands every three years, weigh heavily on the peasant class. This class, however, has very considerably increased since serfdom was abolished, and a commencement of liberty, tho only a commencement, is a good thing. But, unfortunately, the quantity of land has not grown with the increase of the peasant population; it is still what it was when first handed over to the freed serfs. There was not enough land then and of course there is far too little now. Hence that undercurrent of complaint which murmurs through the rural districts of Russia, and which, if it ever bursts forth openly and takes shape in acts, will throw far into the shade the terrors of those peasant uprisings of which history speaks.

In the meanwhile the country population, finding it difficult to live by agricultural pursuits, crowded into the cities and especially into manufacturing centers, and at the same time Russian manufactures began to develop rapidly, as there was a growing demand for them, so that a large conglomeration of working people was brought about under very different conditions from those known elsewhere. For it must be borne in mind that the

Russian workman is ever bound very closely to the rural community which he left for the factory. He is still a member of the *mir*, tho practically separated from it, and pays taxes there exactly as if he were on the spot. It often happens that he has also left behind him there his whole family, while he himself is crowded with his fellow workmen into a sort of barracks, in the immediate neighborhood of the factory, continually surrounded with all the dangers and temptations connected with poverty and living under the very worst material and moral conditions.

Labor strikes are no new thing in Russia. They are of frequent occurrence and are always causes of much disorder, which is roughly put down. The press is not permitted to speak of what happens on these occasions and so little gets abroad concerning the matter. But the recent strikes differed from those which had gone before in this important particular that the working classes and the more enlightened classes on this occasion joined hands, the latter using the former to advance the demands of these enlightened classes, a new and alarming symptom.

These enlightened classes have a program of reforms. But how can the Government be got to take it up when this Government either has no plan and doesn't want any, or if it has one it is quite different from the one proposed to them? What is said in the journals, the drawing-rooms or the clubs doesn't go very far in Russia; it scarcely gets outside of the very narrow circle of which Prince Mechtchersky spoke. So, under such circumstances, the Government pays very little attention to what the enlightened classes say or think. Furthermore, it is perfectly certain that the working classes do not know what is meant by the word *reform*, and if they did know it the thing would not be likely to awaken in them any very great amount of enthusiasm. They know nothing and care nothing about "Western liberties." But they are an army in themselves, and the day was sure to come when somebody would think of putting this army at the service of the reformers; nor was it necessary to explain to this army just what the reforms were. And what an

immediate change was made by the entrance on the scene of this army. Forthwith the reformers ceased to be academic philosophers. They had found a leader, Father Gapon, and they felt that it was now possible to move the earth! If, after what has so far been said, we re-read the address which the good priest wished to present to the Czar, perhaps it will be better understood.

The address, after enumerating a certain number of labor reforms, continued as follows:

"Russia is too big and too complex to be governed by functionaries alone. A national representation is indispensable, for the people alone knows its own wants. Do not refuse its aid, accept its help and order the immediate assembling of the representatives of all classes of the nation, not excluding the laboring classes. Let all be free and equal in the exercise of the suffrage. Order therefore that the representatives of the constitutional body be named by a general and secret ballot. This is our chief demand; all else lies wrapt up in that reform. It is the only balm for our wounds, which, if not healed in this way, will quickly carry us to death."

What is to be thought of this language? I can never be made to think that it is the language of workmen, speaking without a prompter, or that it could be understood by them, such as they are in Russia. But they were called together to the number of 150,000 to support this address by their presence, and, if necessary, to seal it with their blood, which they did do. But I am not going to narrate facts already too well known. I am simply trying to explain these facts. The Government saw in this act a revolutionary manifestation, not an attempt to enlighten and convince the ruling powers, but a planned effort to coerce the responsible authorities. And if we bear in mind that a few days before a cannon, by way of warning, was fired at the Winter Palace, where was then assembled the Czar and the whole court, the logical correlation of events comes out clearly. Notwithstanding the very kindly official explanation of this affair, which was declared to be "an accident," everybody in St. Petersburg saw in it an attempt on the Czar's life. From that moment the smell of powder was in the air.

There is no excuse for that cruel shooting on that fatal Sunday in January. Everybody must condemn that act. I would not say that such conduct only increases the anger of the mob, for it is certain that on this occasion it put a prompt period to the revolutionary movement. But the revolutionary spirit is still alive, and the causes which produce it, as I have just shown, are too old and too grave not to seek and find other means of asserting themselves, as they have since done, even to the limit of assassination. If the Russian Government does not give solid satisfaction to the demands of the hour, which are in themselves serious and legitimate, the danger will increase and rifles will not suffice to down it.

But the war in the East must first be brought to an end, this war which is prosecuted for far off and perhaps chimerical interests, which is incomprehensible to the common mind and with which are mixed far from creditable transactions. This war is unquestionably unpopular. It has revealed in the administration and in the Government shortcomings which it was feared existed, but which it was never dreamed could be so bad. This war is a terrible cause of revolutionary ferment, which acts on the popular mind as well as on that of the intellectual classes.

Public opinion even in Russia has now some idea of its force. There is no autocracy that can ignore this opinion any longer. The Russian Government perceives this. It has already promised labor and social reforms, tho drawing back at political concessions. Before these recent events came to pass the Czar, back in last December, issued a ukase which, if carried out to the letter, will be a long step in advance. This first step will lead to others. But this will not be brought about without strong efforts on the one hand and considerable resistance on the other. There will be hesitation, groping, perhaps, alas! even conflicts. The task will take time to accomplish and for many years to come the strength of Russia will be occupied with internal affairs.

# The Australian Blacks

BY JOHN M. CREED, M.D., M.C.L.

[The Hon. John M. Creed is a man of great distinction in Australia to-day and one of the most extensive explorers of the country. He knows aboriginal Australia as well as any one living.—EDITOR.]

IT is a far call, fetching the color question from the Australian bush, and when it appears in signal instances in the American press one wonders why. Why is this renewed effort to depreciate the black brothers of the Island Continent? It is not an inspiration that Australian aborigines are low in the scale of humanity. It has gone uncontradicted for a century. But, whatever the immediate cause, it rouses a kind of indignation in the minds of those who know them as well as I, who have spent so much time among them, seeing them and knowing them in all stages of development. They are not in a position to speak for themselves, and it rouses one to words for them to read in Thomas's book, "The American Negro," of "the Australian negro, the zero so to speak of all anthropological analysis, who is of such low development as to be incapable of dealing with other than units of ideas as well as numbers;" for all such statements are positively false.

The original estimates of Australian aborigines came about naturally enough. They were made by the early settlers, who were themselves too low to understand men of strange language and habits. The officials of those first settlements were intellectually below most of the convicts, while the natives had only the lowest of these for associates, learn-

ing their vices and their depraved English simultaneously. With such an education they came in contact later with better classes of English, who naturally, from what they saw, indorsed the first findings and the verdict has become a common creed.

This was more easily effected because it is against the English policy to elevate the blacks of Australia, on the principles which America is following in the Philippines. Even the English language is avoided in the public schools where it is possible to impart necessary information in native tongues, on the ground that it

Three West Australian Chiefs Ready for Anything from Jest to Earnest. The White Ornamentation Consists of the Down of Birds Stuck on with Blood

Coorobooree Dance

is more cruelty than kindness to lift them out of their present state only to refuse to accept them in our own on terms of equality. Dr. Walter Roth, the chief authority, even goes so far as to advocate legally preventing all intercourse between the blacks and whites, so as to avoid a future and serious color question such as has developed in America. Possibly Australia is right in this, but the fact remains that where they have found accidental opportunity they have profited by it to an extent contradicting accepted theories.

The blacks still run wild, as a rule, in their almost and quite naked state. Very few of them ever enter the cities, and in the coast towns and bush settlements, where their services are indispensable, they are treated upon the old principle that they are only a fraction at most above the brutes. But in a careful anthropological estimate for the benefit of the outside world it is but just, if we take them as we find them, to do so in honest comparison with the opportunities which have been offered them to improve—to be anything else. Very few have had any opportunity whatever to absorb what was better than the worst qualities of the worst whites. With more experience

and better facilities for judging from this viewpoint than most, I may be permitted to instance a few cases convincing me that the common notion is not quite true. For example:

A black baby boy was about to be killed, according to custom, when his parents had lost their lives in battle, up in the Blender Ker Ranges, when he was bought by a Scotch naturalist for half a crown and brought up in his family. He is now eighteen. He speaks as pure and grammatical English as any white man, or, with a keen sense of wit, he will drop into the broad Doric Scotch of his adopted father. He graduated very near the head in a class of two hundred and fifty boys in the public school and has since been employed in the drafting room of one of the largest engineering and shipbuilding establishments in Australia, where the head draftsman told me that he fully held his own with any boy of like education. He sketches with unusual ability and plays The Pipes on the chanter, thoroughly enjoying the fun when Scotch skippers ask his employer: "Where did you find that black Scotchman?"

A black baby, brought from the bush and raised in a village in New South

Wales, is now about twenty, assisting the blacksmith of the place, who says that he is most efficient, showing more thought and tact and perseverance than the average white apprentice.

A little fellow twelve years old was taken from a native camp to carry mails at a station. A lady there became interested in him and at odd moments taught him to read and write. He saved his wages, took up land, bought stock and is now rated for taxes at \$50,000. Wishing to interest him in the ethnological study of his race I took him over the Australian Museum at Sydney, showing him the specimens of prehistoric implements of Europe, comparing them with those in use in remote parts of Australia.

"After this," he said, "one cannot avoid accepting evolution, can he?" And as we were leaving the museum he said: "The whites need not be so conceited, for their ancestors were pretty much like mine, were they not?"

I listened to a full-blooded black the other day addressing a crowd of whites in better English than most of them

could have spoken, on the culpable extravagance of the State Governments.

Black girls make admirable housemaids out in the settlements, but it is difficult to induce them to go into the cities. There is one now employed at a private hospital in Sydney who is considered one of the most efficient and trustworthy of the assistants. She is a great mimic and full of fun, but she is intensely sensitive to any rudeness, especially touching her color—which is the blackest of the black.

A popular criterion of race eminence to-day is in athletic dominance and there the blacks are far ahead. They are first-class cricketers, good at football, the best runners in the country and fine horse-men.

The opening quotation from Thomas suggests a popular belief that they are unable to count above ten. In their wild state they had little need of exactness in large numbers and it is true that many of their tribes lacked definite terms for larger numbers, but since the want has been supplied by English numerals, and they have had occasion to use them, they

can enumerate as well as any one. They are always assigned to count sheep, running through a cut because they can be

Native Boy Employed as a Draftsman by the Morts Dock Company, Sydney. When a Baby He Was Bought for a Crown from a Native, Who Was About to Kill Him

relied upon, and it is no small test when it is remembered that even a very small flock contains over a thousand sheep.

The correct way in which they use the English language when they have even a fair opportunity to acquire it is a constant surprise. They have nothing whatever of the accent or mannerism of the American negro, after his generations of association. I know of a case where a white man married a black woman, who afterward taught him to read and write and greatly improved his English.

Then there is native genius as evidence, in which they should be given a high place. A single instance which is trivial is yet very suggestive. It is the chipped glass weapons which are now so abundant in many parts of Australia. The raw material is the bottles thrown away by white men at stations or on marches, or washed ashore from vessels along the coast. The natives were not gradually led to accept this new material through long experience with flint or similar substance, for nothing of the kind exists there. When they discovered the possibility they changed at once from quartz spear-heads to beautifully chipped and perfectly shaped glass, as the accompanying illustration shows; and it re-

quired no mean capacity in a primitive race to discover the utility of a wholly novel, unsuggestive substance, and then to modify the force, direction and method of their blows to accomplish successful productions. The only instrument they use is a pebble, but a white man could hardly rival some of their chipped glass to-day.

Or if imaginative romance be the standard, there is nothing more suggestive in the dreams of any nation on the earth than what is found in Mrs. Langloh Parker's collection of the folk-lore of aboriginal Australia.

They are stalwart fellows, these natives, a great many of them being over six feet high and broad and muscular. They are solemn and dignified even in the grotesque decoration they adopt, and artistically hideous in the welts and slashes with which they cover themselves. But there is a deep vein of humor, too, underlying their black hides. They are alive to the ridiculous and are very quick to see a joke and enjoy it.

It is true that in their own communi-

Native Hospital Assistant in Sydney. When a Baby She Was Bought for a St. Bernard Pup

ties they go about nearly or quite as God made them, but it is also true that where they have not learned from us to the con-

Native Spear Heads, Northwest Australia. The one at the left is chipped glass from a soda water bottle; the central spear head is chipped from a gin bottle and shows the distiller's name in the glass. (The chipping is all done with a pebble.) The point on the right is of quartzose, and is the style used in olden time

trary they have a modesty that is deep and real. There is more vulgarity to be found in any single block of the civilized world than among Australian blacks. If the whites of Australia were as morally minded as the blacks there would be a great improvement in the present conditions.

They are a happy people in spite of

their solemnity, and particularly fond of games, for which, better than North American Indians for war, they decorate themselves most marvelously.

It is really their country, not ours. It is their custom to be what they are and we make a great mistake when we accept the old theory that they are the zero of humanity.

SYDNEY, AUSTRALIA.

# Literature

## Apostolic Doctrine and Morals

BERNHARD WEISS is the dean of German theological professors. Born two years earlier than the late Philip Schaff, he resembles the German-American theologian in his prolific labors, his mediating position, and his literary activity in old age. The work now translated<sup>1</sup> was published in German when the author was 77 years of age, just 50 years after the beginning of his academic career. It is nevertheless a vigorous and careful presentation of the religion of the New Testament as understood by one who stands half way between the advanced critics and the churchly orthodox. Dr. Weiss adopts frankly the principles of criticism, and denies the verbal inspiration of the Bible and the doctrine of inerrancy. He insists that Jesus had only prophetic knowledge, not omniscience, and maintains that his resurrection was not a return to his earthly body, and that there was no ascension as distinct from the resurrection. On the other hand, he holds the old conception of canonicity, that a writing must be of apostolic origin in order properly to be included in Scripture; he regards the Fourth Gospel as the work of the Apostle John, the Acts as a correct picture of early Christianity, the epistles of James and John as the work of eye-witnesses. As an exegete Dr. Weiss excels, and since his method is to interpret the New Testament and let it speak for itself his work will well repay study, and men of all schools will find something to learn from it.

Morals in the Apostolic Churches is treated by a German professor at the other extreme in age from that of Weiss.<sup>2</sup> Ernst von Dobschütz was born in 1870 and is one of the most brilliant and promising of the younger men on the German theological faculties, being the author of a considerable number of able

works on the history of the apostolic age, and the successor, by appointment a few months ago, of the celebrated Professor Holtzmann, of Strassburg. Von Dobschütz is a moderate critic, and he excels in clear division and analysis of his subject and in graphic portrayal. A history of morals in the early Christian times, of the moral difficulties which Paul confronted and how he met them, of the ethical ideas prevalent in Jewish-Christian churches and the moral vagaries of the early gnostics—such a treatise on such an important and fascinating theme by such a scholar as von Dobschütz should receive hearty welcome in English as it has already in German. Early Christian manners and morals are fully as useful a study as early Christian doctrine, and they have received far less consideration.

## The Marquess of Salisbury as a Quarterly Reviewer\*

THE Tory *Quarterly Review*, unlike its contemporary the *Edinburgh Review*, never had a contributor who for literary style ranked with either Sydney Smith or Macaulay. It would be difficult to say how many times Sydney Smith and Macaulay's contributions to the *Edinburgh Review* have been reprinted, but they have been reprinted so often and have been so widely read as to become classic. There have been comparatively few reprints from the *Quarterly Review*, and none of them has brought added fame or a much wider reading constituency for its author.

In the middle fifties and the early sixties the late Marquess of Salisbury, then Lord Robert Cecil, was a frequent contributor to the Tory review. These were the days when he was a young and unofficial member of the House of Commons, before he joined the moribund Disraeli Administration in 1867, as Secretary for India. He was of the staffs of the *Standard* and *Saturday Review*,

<sup>1</sup> THE RELIGION OF THE NEW TESTAMENT. By Prof. Bernhard Weiss. Translated from the German by Prof. George H. Shodde, Ph.D. New York: Funk & Wagnalls Co. \$2.00.

<sup>2</sup> CHRISTIAN LIFE IN THE PRIMITIVE CHURCH. By Ernst von Dobschütz, D.D. Translated by the Rev. George Bremner, B.D., and edited by the Rev. W. D. Morrison, LL.D. New York: G. P. Putnam's Sons. \$2.50.

\* ESSAYS BY THE LATE MARQUESS OF SALISBURY, K.G. New York: E. P. Dutton & Co. Two volumes. Pp. 212, 241. \$14.00.

and in those years he wrote thirty articles for the *Quarterly Review*. Six of these articles, written between 1860 and 1864, have now been reprinted. The collection is in two volumes. In the first are essays on Castlereagh and Pitt. In the second there are three essays on foreign politics—on Poland, on the Danish Duchies, and on British Foreign Policy in 1864.

The first volume is by far the more interesting. There is, as might be expected, seeing that the essays were written forty years ago, nothing that is new about either Castlereagh or Pitt, as the essays were based on the Lives and Letters of these statesmen, then recently published. Their chief interest lies in the fact that they were written by a man who was afterward at the head of three Tory Administrations and who was a typical representative of aristocratic Toryism in the last half of Queen Victoria's reign. From these points of view these reprints have a distinct value. But there is to them no such permanent value as has attached to the reprints of the two distinguished contributors to the *Edinburgh Review* in the days when both the quarterlies exercised a much greater influence on English political thought than they do to-day, when every first-class newspaper—London or Provincial—has on its editorial staff men who are as capable of discussing political tendencies and movements as the men who write anonymously in the *Quarterly* or the *Edinburgh Review*.

## Channing's History of the United States\*

THE appearance of a history by a master hand ought to be regarded as a great event in the life of a nation. Scholars have long anticipated the appearance of Mr. Channing's work. His special studies appearing in various scientific publications and his academic work in Harvard University have given assurance that the ripe product of his historical work would be a worthy contribution. The first volume fulfils every expectation. The scholarship easily sur-

passes that in any other undertaking of the kind, and the clear, pleasing and simple style makes the book eminently readable. If the literary flavor found in some popular histories is lacking, there is ample compensation in the depth of knowledge and the plain-spoken truth.

The guiding idea of the work is, as the author says, to view the subject as the record of an evolution. He tries to see in the annals of the past the story of living forces, "always struggling onward and upward toward what is better and higher in human conception." One does not find here a mere relation of the annals of the past, but a description of the development of the American people—the growth of the nation "from the political, military, institutional, industrial and social points of view." Instead of doing what has so often been done—tracing the story of each isolated political unit, as the antiquarian does—Mr. Channing has considered the colonies as a part of the British empire, "as having sprung from that political fabric, and as having simply pursued a course of institutional evolution unlike that of the branch of the English race which remained behind in the old homeland across the Atlantic."

We expect from Mr. Channing such fairness and catholic judgment that his rather severe handling of the early Spanish explorers seems a blemish in an otherwise generous treatment. Moreover, it would seem that the growing importance of the Southwest and our recent acquisition of Porto Rico would make necessary a fuller treatment of the whole subject of Spain's activities in America. However, that is largely a matter of opinion and purpose.

One of the most admirable features of Mr. Channing's work is the critical matter occupying several pages at the close of each chapter. There is no mere list of books, but an analysis and criticism of the really important sources and secondary works. These estimates are the work of a master. Nothing more valuable can be found to aid the advanced student of American history. Into these notes at the end of the chapters is thrown all discussion of knotty problems which plague the writer—and often the reader—of history. "Plymouth Rock" and

\* A HISTORY OF THE UNITED STATES. By Edward Channing. Vol. 1 (1000-1660). The Macmillan Co. \$2.50.

other historic fallacies are disposed of in this limbo for critical apparatus.

If we were asked to give a summary estimate of this new work we should say frankly that it seems to us to stand pre-eminent among the scholarly efforts to tell the history of this country.

**The Game.** By Jack London. New York: The Macmillan Co. \$1.50.

They say that Mr. Jack London is personally of so mild a disposition that he faints at the sight of blood, which, if true, makes it all the more remarkable that he should let it flow so freely in his stories. His latest might be regarded as a tract against prize fighting if the ending only is considered, but all Mr. London's art is used to impress upon the reader the conviction that *The Game*, the delight of contest and the joy of triumph, is worth the sacrifice of love and home and family. It is "the call of the wild" again; the scratching of the civilized man to show the savage beneath the varnish of culture; the portrayal of the fighting instinct of the cave-man and the loving instinct of the cave-woman as they sur-

of love at first sight, a phenomenon rarer now than it used to be, at least, in novels—between young and handsome prize fighters of incredible purity of character and a soda water girl, impossibly innocent and ignorant for one who lived with the plain spoken Mrs. Silverstein. Since Richard Harding Davis wrote "Gallagher" and George Meredith "An Amazing Marriage," prize fighting has become rather common in fiction, but no one has described the brutal scene with more vividness than Jack London. Whether this be a merit or the reverse will depend upon the taste of the reader.

**Jeremy Taylor.** By George Worley. With a frontispiece. New York: Longmans, Green & Co. \$1.25.

Recently attention was called to Edmund Gosse's life of Jeremy Taylor, but, as the author of the present work says, the subject is treated so differently, and the objects of the two books are so far apart as to "prevent anything like a collision between them." The aim of this work is to revive, in the laymen of the Church of England, an interest in the works of Bishop Taylor. To this end he has appended a bibliography, containing a list of the Bishop's works and a selection of other books and papers which will throw light on them. The author does not call his book a biography, but "a sketch of his life and times, with a popular exposition of his works."

**Bryan's Dictionary of Painters and Engravers.** Vol. V. New York: The Macmillan Co. \$6.00.

The fifth volume of *Bryan's Dictionary of Painters and Engravers* completes a work which should be absolutely indispensable to every one interested in art or artists. The difficulties of compiling such a dictionary are immense and too much cannot be said in praise of the manner in which Dr. Williamson has surmounted them. He has had the text of the old edition thoroughly revised and corrected, and many new essays written on the more prominent artists of yesterday and to-day. This last volume, for example, contains, among many other satisfactory biographies, notable articles on Titian and Whistler. Mr. Dennis is

JACK LONDON

vive in their descendants of to-day. The first half of this long short-story is a beautifully written description of a case

most happy in his just, sensible and appreciative criticism of the work and genius of the extraordinary Whistler. It is a day of specialized knowledge and it is satisfying to know that the lives of all the great painters have been written by men who are experts in their line. The results of the modern critical methods are very noticeable in the conservative lists of works attributed to the old

masters. These same complete records of known authorship are not the least valuable part of the mass of information contained in these volumes. In a very manly preface Dr. Williamson shows that sign of the elect—an open and teachable mind—by inviting correction and criticism. In answer to the often repeated charge of devoting too much space to modern artists he gives the very sensible

"A Canon with St. Victor" (or St. Maurice). From the Painting by H. Van der Goes in the Glasgow Gallery. From Vol. V of Bryan's "Dictionary of Painters and Engravers," Published by the Macmillan Company.

explanation that while there is no end of accessible information on the old masters it is exceedingly difficult to learn anything about modern painters. Copious and well-selected illustrations, and reproductions of the monograms of painters and engravers add to the completeness of this admirable encyclopedia.

**The Flower of Youth.** By Roy Rolfe Gilson.  
New York: Harper & Bros. \$1.50.

The reader's enjoyment of this volume will depend upon how much of the power of illusion he has left over from his childhood, and upon his ability to reconstruct the enchanting experience of that period from memory. Some lose the gift and the disposition to do either soon after maturity. They are so engrossed with stern realities that their eyes are holden toward that fairer clime from whence all children come. For these, Mr. Gilson has no message, but to those who remember the fairy corners of the world, where long ago they played hide and seek with their own winged fancies, his book will come as a delightful refreshment. He has preserved even the precious accents of childhood, which made sugar seem sweeter and gold more "goldy." It is the ecstasy of desire and happiness expressed in an extra young syllable and added to matter-of-fact grown up words. The strange breaks that occur in the memory of children and that often extend over a period of several years, are clearly set in, as hyphens of time across which the little traveler comes, unbeknowing to himself. And we are all kin to the small boy, who dated everything in his experience from a certain morning marked by a bountiful syrup jug, which was left entirely at his disposal. There in a stage of contentment in that happy land which depended mainly upon an unlimited supply of sweets. Sugar appealed then more strongly than heaven to our little honey bee appetite. Later he comes to youth and love so reverently that one knows not surely if he is in the flesh or out of it. Altogether, he commands that delicacy of literary expression, and that fragrant piety of the imagination in dealing with his subject which is a rare gift in any writer.

**Hecla Sandwith.** By Edward Uffington Valentine. Indianapolis: The Bobbs-Merrill Co. \$1.50.

The story of *Hecla Sandwith* opens in Central Pennsylvania, just fifty years ago. We are introduced to the queerest Quakers in all literature. It is a shock to discover that the "Friends" we have, perhaps, idealized can be grasping, vain and irritable folk, "gey ill to live wi'" as any Carlyle. Preserve us a' from a Hetty as a housemate, and may we be delivered likewise from a Hecla Sandwith! One is weak, narrow and disagreeable; the other is strong, overbearing and impossible. We do not often have to complain of a hero altogether too good for the wife his literary creator assigns him, but we register a protest here. The book has the merit of careful husbandry in an unworked field, and it is well written; a novel of unusual power and interest.

**The Troll Garden.** By Willa Sibert Cather.  
New York: McClure, Phillips & Co. \$1.00.

A group of seven short stories quite out of the ordinary, indigenous in matter, foreign in manner, the sort that one would recommend strongly but not widely among his circle of acquaintances. In style they remind one of Maupassant, but much more of the Russians. Is there something after all in the out-of-fashion climatic theory of literature that stories from the Great American Desert should have the savor of the steppes? For the best pictured scenes in the volume are of our own arid region. Western Kansas and Nebraska and Southeastern Wyoming are described, not only with minuteness, but with feeling. Miss Cather was transplanted from the Shenandoah Valley to a ranch in Southwestern Nebraska about 10 miles north of the Kansas line when she was only nine years old and, until she went to the State University at Lincoln, she was in touch with pioneer life and can interpret its privations and rawness. But, like Hamlin Garland, she sees only one side of it: the drought, the drudgery, the isolation and despair. She has missed what William Allen White has caught, the push, the humor and the indomitable and fantastic hopefulness. These are quite as characteristic of the

life of the plains as the side of the shield she sees, and until she catches that too her work is defective. Two of the Western stories, "The Sculptor's Funeral," and "A Death in the Desert," and "Paul's Case," a study in juvenile morbid psychology, unfortunately too true to life, are the strongest of this collection, but there is promise of something greater in them all.

**On Becoming Blind.** By Dr. Emile Javal. Translated by Carroll E. Edison, A.M., M.D. New York: The Macmillan Co. 16mo, pp. xiv, 191. \$1.25.

This book is not written simply for the blind, but Dr. Javal says in his introduction: "I write for the family of the blind." Being himself blind and knowing their bondage and limitations, he speaks for them in a way a blind person cannot speak for himself to those of his own family. He suggests numberless ways in which the blind can be taught to help themselves and others. The personality of the author is wise, strong and tender. Those who read between the lines feel the pathos of it all, and honor this earnest purpose to add his stone "to the building of civilization and progress." Tho he says he cannot speak of religion as a help to the blind, he gives them Christ's law in a quotation from the blind Professor at Basle: "The blind can find satisfaction in existence only if he does not live for himself alone." Dr. Javal says later himself:

"Among men who are free from material anxieties, those who have never taken thought save for their pleasure and their own affairs are the most unhappy when they become blind."

The style of the book is simple, direct and scholarly. Dr. Javal devoted much study to the kind of type best suited to the eye and it seems particularly unfortunate that the popular French edition of his book is printed in a difficult type to read, but the print of the English translation is more than usually good.

**Kobo.** A Story of the Russo-Japanese War. By Herbert Strang. New York: G. P. Putnam's Sons. \$1.50.

The historical novel nowadays treads close upon the heels of the daily press, and Putnams do not wait until the war

is over before getting out a boy's story dealing with its beginning. We submitted it to the expert judgment of a twelve-year-old boy and the next morning he reported that it is as "good as Henty," a critique which, tho short, is definitive in its classification and complimentary enough to satisfy even the author.

## Pebbles

FIRST we had the Strenuous Life, then the Simple Life, now we have the Equitable Life.—*Life*.

....*She*: "Be frank with me." *He*: "I can't. My name is James."—*Harvard Lampoon*.

### INSURANCE.

Life is real, life is earnest,  
And the grave is not its goal;  
Rather 'tis to see which party  
Shall the surplus funds control.

—*New York Sun*.

....*Customer*: "What made the old guy so sore?" *Boy*: "He's nutty, I guess. He wanted two dog biscuits, and I only asked him if he'd take 'em here or have them wrapped up."—*Cornell Widow*.

...."I rise to the occasion," murmured the Russian duke when they planted a bomb under his chair. Gratified that their efforts were so courteously recognized, the mob planned a blow-out for the rest of the family.—*Columbia Jester*.

....A young man who handed a conductor a silver dollar in payment for his fare, and in a spirit of fun put a distorted interpretation on the question when the trolley man asked him if he had no smaller change, nearly started a fight in a Fifteenth Street trolley car the other night. "Is that the smallest you got?" asked the conductor, as the big silver coin was laid in his palm. The passenger felt in his trousers pocket and pulled out several other dollars. Then, taking the coin from the conductor, he compared it with the others, carefully thumbing the edges. Then he handed the coin back, and placidly said: "No; I guess there's no difference; they all seem to be the same size." The conductor's face grew red as he looked at the passenger in astonishment. "Think I'm a fool?" he said. "You can't make a monkey out of me. I want to know if you have no smaller change than that." "Oh! I beg your pardon," replied the smiling young man. "Why didn't you say what you meant? I thought you referred to the size of the dollar."—*Philadelphia Record*.

## Bowen and Loomis

THE fact that Herbert W. Bowen, lately Minister to Venezuela, is a son of Henry C. Bowen, founder of THE INDEPENDENT and its proprietor until his death in 1896, may explain why we have kept silence thus far, but it is not now a sufficient reason why we should avoid comment on his dismissal by President Roosevelt. The President's action, with Mr. Bowen's statement, we have summarized in our "Survey."

The fault charged against Mr. Bowen, for which after a long, honorable and even distinguished service he has been dismissed with a very severe rebuke, is simply this, that he disobeyed the letter of an executive order according to which no member of the diplomatic service is permitted to discuss except with the State Department charges affecting the character or reputation of any other member of the service.

That Mr. Bowen instigated the charges against his predecessor is far from the real fact. When he reached Venezuela in 1901 he found the scandal already rife. He made no move until, in February, 1904, he found the incriminating documents in the archives and sent them to Secretary Hay. He then waited another whole year, when, in February, 1905, came new reports of the \$10,000 check, of which he sent word to Mr. Hay. In three days came the offer of transfer to another diplomatic post and a month later came the representatives of the *New York Herald* and the whole thing was given to the American public, altho it had been printed in the *Paris Temps* a month before.

Mr. Loomis's bad reputation was notorious in Caracas when Mr. Bowen went there, and the scandal connected with his diplomatic career there was public property.

Nor was Mr. Bowen actuated by any feeling of personal hostility toward Mr. Loomis. Mr. Bowen never met Mr. Loomis before he went to Caracas and only met him two or three times afterward. Those who know Mr. Bowen will find no difficulty in understanding either

his course or his motives. He is an aggressively honest man who believes that the highest standard of honor is none too high for the conduct of the representatives of the United States in foreign countries. The man who had kept his hands scrupulously clean from graft, who had, when allowed by the Department at Washington to act as the attorney for Venezuela at The Hague, refused, from a sense of honor, to accept a dollar of compensation beyond his expenses, may be pardoned for his insistence on the exposure of corruption elsewhere. It explains the spirit which forbade him to accept promotion when it seemed intended to cover a scandal.

It is very easy to understand how such a man might in the opinions of some persons insist overmuch upon the exposure of corruption in public places. But we are surprised that insistence of this character should merit a severe rebuke from President Roosevelt, who in two long columns dismissing Mr. Bowen devotes but two lines to Mr. Loomis, whose conduct he condones.

The President finds Mr. Bowen guilty of unpardonable insubordination; he excuses Mr. Loomis's conduct as merely "indiscreet."

It is surprising that he excuses and condones Mr. Loomis's acts when we remember the hot tenor of his communication condemning the Post Office grafters. For Mr. Loomis was guilty of one of the gravest crimes of which a diplomat can be guilty. He was prostituting his honorable trust for personal gain. The documents found in the Legation archives at Caracas and transmitted to the State Department by Mr. Bowen showed that Mr. Loomis was dealing for his own profit in claims against Venezuela instead of using his position for the protection of the claimants. Take the Mercado claim, concerning which Mr. Loomis wrote on the special paper of the Legation:

"LEGATION OF THE UNITED STATES,

"CARACAS, August 25th, 1900.

"W. W. RUSSELL:

"Dear Sir.—In reference to the portion of Mr. Mercado's claim which I bought, I want

to state that the only terms of settlement which I will accept other than a full cash payment of about 30,400 bolivars in gold, are the following: I will accept 20,000 bolivars in gold and 10,400 bolivars in salt bonds at the rate of 82 per cent., or 5 per cent. below the quoted market rate, provided it does not go below 80 per cent.

Very truly,

"F. B. LOOMIS.

"If the matter is settled, please deposit the cash and bonds to my credit with H. L. Boulton & Co.

F. B. LOOMIS."

"I received for Mr. F. B. Loomis the amount of 20,000 bolivars in cash and 12,000 bonds of the salt, amount which I have this day delivered to Mr. W. W. Russell.

"CARACAS, 27th September, 1900.

"A. F. JAURETT."

Mercado was a Porto Rican who had built roads and bridges by hard work. The claim was allowed and was to be paid. Instead of getting the money for the man who did the work Mr. Loomis, American Minister, helped a syndicate to fleece him of his money. Mr. Loomis says he was not a member of the syndicate, but only helped it by lending it money and getting the interest on his advance. But even allowing that he only lent the money (his letter says, "which I *bought*"), a man who would help the parties who were trying to squeeze the claimant must not be surprised if his excuses are not wholly believed. Take the case of the Mayers letter: Mr. Loomis engaged, beyond denial, while Minister of this country, to try to persuade Venezuela to refund its debt by a loan out of which Mr. Loomis was to make a million and a quarter dollars. Under the law of New York directors of an insurance company who exploit their position for personal profit become ineligible for any office in such a company. It is just such a wrong of which Mr. Loomis was proved guilty, and he ought not to be retained in his present position or to have been appointed to represent the country in France or anywhere else.

Is this another example of a characteristic of President Roosevelt, as it was of President Grant, never to believe even proved evil of his friends? Like President Grant also he stands stoutly for those for whom a friend vouches. He seems to have rested his faith in Mr. Loomis on the word of Mr. Avery D.

Andrews, his friend and associate when he was on the Police Board of this city, but who is now one of the men who, with Messrs. Elkins, Widener and Mack, are in control of the Bermudez Asphalt Company, with which Mr. Loomis says he only "exchanged cheques."

We have no desire to assail Mr. Roosevelt for the terms or tone of his communication dismissing Mr. Bowen. It is clear that Mr. Roosevelt is frankly expressing his real opinion, but it surprises us that he should regard even an excess of zeal in a good cause for the exposure of wrong, tho against Mr. Bowen's official superior, as an unpardonable insubordination. Has he forgotten his own severe arraignment of his superior officers when he was commanding the Rough Riders and got up the famous round robin as to rations and sanitation? His act was a public service, but it was clearly insubordinate. What surprises us most of all is that the conduct of any one who misused for his personal gain the confidence placed in him by his country should be slurred over as venial by President Roosevelt, with not a sign of the indignation to which he gave utterance when he bade to "cut the ulcer to the bone." We confess that it is strange.

### The Atchison Road's Rebates

OWING to his repeated denunciation of unlawful rebating and other discrimination by railroads, and to his earnest and persistent advocacy of rate legislation as a remedy for such evils, the President should have seen that there were special reasons for permitting the law to take its course in the most notorious cases of rebating of which the public now has knowledge. We refer to the violations of both the law and the injunction of March 25th, 1902, by the Atchison, Topeka & Santa Fé Railroad Company, as to which the Interstate Commerce Commission remarked, when submitting evidence of the same to the Department of Justice, that this corporation had been "guilty of flagrant, wilful and continuous violation of law for the last five years."

When two eminent lawyers (one of whom had been Attorney-General) were

appointed by the President to examine the cases in question and to conduct the prosecution if prosecution should be required, this was regarded as proof that the President could not be induced to shield anybody, even a member of his own Cabinet. It was observed with satisfaction that Messrs. Harmon and Judson were, as Attorney-General Moody now says, "invited to exercise the broadest discretion as to persons as well as corporations in dealing with the subject." It was then universally believed that they would not be restrained if they should decide to proceed against Mr. Paul Morton as well as against the company in which he had been the responsible officer in charge of freight traffic when the law was so flagrantly and persistently broken.

But when they recommended, not that Mr. Morton and his brother officers should be prosecuted on a criminal charge, but that they should be required to show cause why they ought not to be held responsible for the violation of the injunction, they were restrained by the President and the Attorney-General, on the ground that the evidence procured by the Commission (merely to establish the fact that the law had been violated) did not directly connect Mr. Morton with the unlawful acts, and for the additional reason (pointed out by the President) that Mr. Morton's complete innocence was conclusively proved by his own assertion of it.

It should be borne in mind that in the proceedings recommended by the two attorneys Mr. Morton was to have ample opportunity to establish that innocence which he asserts in his letter to the President and which the President assumes to be beyond question. We quote passages from the final letter of Messrs. Harmon and Judson because of their bearing upon this point and also because their reasoning on allied questions is of great force:

"The violation by a corporation of an injunction directed against it and its officers always calls for a rule against such of them as had control of its conduct to show cause why they should not be held personally responsible. They are *prima facie* guilty of disobedience. It was their duty to see that the acts forbidden were not done, as well as not to do them. The

necessity of this rule is apparent as well as its justice. The facts are peculiarly within the knowledge of such officers and of subordinates under their control. Except in cases so rare that they may be called accidental, there are no means of discovering the facts except by such a proceeding as we have advised. This well-established rule, which is sufficient to justify the action in any case, seemed and still seems to us peculiarly to fit the case in hand.

"A rule against the controlling officers of the railroad company to show cause is simply the recognition by the court of the responsibility incident to their official relation. It is a demand for an explanation and not, properly speaking, an 'accusation.' The action of the corporation is necessarily presumptive evidence against its principal officers who had charge of the department in question. The proceeding we recommend is not unusual, but the natural and ordinary one in such cases.

"What we have said is peculiarly true of the great corporations of our day. They cannot be imprisoned, and punishment by fine is not only inadequate, but reaches the real culprits only lightly, if at all. The evils with which we are now confronted are corporate in name, but individual in fact. Guilt is always personal. So long as officials can hide behind their corporations, no remedy can be effective.

"When the Government searches out the guilty men and makes corporate wrongdoing mean personal punishment and dishonor, the laws will be obeyed."

Mr. Morton appears to have avoided this opportunity to convince a court that the explanation given in his letter to the President ought to be accepted. Why? One would suppose that a man who deserved the President's tribute to his "fearlessness" and "frankness" and "unflinching courage" must have longed to clear himself, by a court's judgment, of the charges to which so much publicity had been given. Did he avoid the opportunity because of the official record of the unlawful rebates granted by the Atchison Company to his two brothers in the salt business? Was it because it might be difficult to convince the court that he had no knowledge of those rebates, or of the continuance of the rebates in this coal business that was worth \$1,000,000 a year to the company? Was it because this arrangement for coal rebates, made by himself, was as much a violation of law before the injunction was issued as it was afterward? Did he think his explanation might seem in-

sufficient to those who recalled his admission that he and his associates had made unlawful rebate agreements with respect to other merchandise, knowing them to be unlawful?

If he is confident that he can clearly establish his innocence, it is his duty now, his duty to himself and to the Equitable Life Assurance Society, to ask for a reconsideration of Attorney-General Moody's decision, and to appear before the court in the proceedings for contempt which have the President's approval. And the President, whose desire for his welfare is so manifest, should urge him thus to seek that enduring relief which only the court can give.

No reference to the rebates given to Mr. Morton's brothers in the salt business is made in the published correspondence. This matter, as to which an official report was sent to the representatives of the Department of Justice, was not in the hands of Messrs. Harmon and Judson, but it ought to have been considered by the President before he wrote his letters to Mr. Moody and Mr. Morton. We shall not comment upon any part of those letters except that in which Mr. Roosevelt, warmly commending Mr. Morton's testimony three years ago, when he admitted the granting of unlawful rebates, says:

"At the time when you gave this testimony the Interstate Commerce law in the matter of rebates was practically a dead letter. Every railroad man admitted privately that he paid no heed whatever to it."

Put it was a just law, and it had not become a dead letter by the consent of the people of the United States. We are not saying that the President desires to be understood as finding in this prevailing contempt for the statute an excuse for any railroad officer who violated it. But we do say that it was not a valid excuse. If an honest railroad officer saw that he must break that law if he would keep his place, then it was his duty to resign and go into some other business. If he chose to remain and to be a law-breaker, not even a confession some time thereafter of his wrongdoing could rightfully entitle him to the praise that is deserved by a man "clean as a hound's tooth."

## Modes and Modesty

THE paradoxes of modesty which Mrs. Gilman discusses in this issue appear somewhat less puzzling when viewed in the light of the original and fundamental meaning of the word. "Modesty," or *modestia*, comes from the Latin *modus*, measure or standard, and is therefore related to such words as "modes" and "moderation." Primarily, then, modest dress or behavior is that which is in accord with the accepted canons of taste, whether these are good or bad—that is, *à la mode*. The modest, or moderate, man or woman is one who keeps to the safe middle path and avoids idiosyncrasies and abnormalities. That the word retains much of its primitive connotation is quite evident, and this explains many of the amusing ways in which modesty finds expression. It does not make any difference how much or what part of the person is exposed to view, or whether the costume is inherently suited to one's work and position; so long as it is conventional it is esteemed modest. If there is anything about it that shocks one's own sense of propriety or appropriateness, modesty itself induces one to suppress the personal repugnance and checks the desire for deviation from the norm. Modesty thus serves as an enforcer of conformity and a discourager of originality. It is a virtue because it makes one hesitate and prove his ground before he does anything that runs counter to public opinion. But like all the others, it ceases to be a virtue when it belies itself and becomes immoderate.

The blush of modesty is the public confession of a consciousness of a violation of social convention. It is an acknowledgment of the right of one's companions to judge of him by the common social standard and a deprecatory expression of the fear lest one's acts, words or thoughts should be found unworthy when so judged. One may be right and realize it, and yet blush because he knows he is acting contrary to expectations; he is setting his own judgment against that of his

associates. When a man refuses a temptation offered by vicious companions the blush is on his cheek, not on theirs, altho he is positive he is right, and they may inwardly agree with him. A sensitive person will blush to pronounce a word correctly when he knows that another pronunciation is the only one recognized by those he is speaking to. The blush is, then, not a confession of guilt, but of disapproval, felt or anticipated. But the burden of proof of the rightness of his acts is, as it should be, thrown upon the innovator.

Since progress in civilization is in part dependent upon the extent and ease with which social control can be extended upon the individual, the blush of modesty has a very useful purpose. For it is not sufficient that the violator of social forms should realize the seriousness and very probable erroneousness of his act, but he must be seen to be aware of it. Edward Bellamy once wrote a story of an island of mind-readers. In consequence of the universal power of the inhabitants to read each other's unspoken thoughts there was no evil on the island, for a vicious or selfish thought that arose in the mind of any one was at once perceived by his companions and he in turn felt instantly their disapproval of it. Naturally such thoughts were checked, and the incorrigible who could not check them were ostracized. In a crude way the blush of modesty serves the same purpose of a window in the soul. It is most active, not in childhood or maturity, but during adolescence, the teachable period. When a man or woman gets too old to blush his or her education is completed.

Since its usefulness depends upon its visibility, the blush appears chiefly in the face and such parts of the skin as are exposed to public gaze. According to Darwin, races naked to the waist blush over the whole upper part of the body. The white man has the advantage over the black in that his blushes are more visible. This makes him more amenable to social disapprobation and may have aided in his greater moral development. The blush

acts like the red flag in train service—it is a warning of danger and tends to keep people on the right track. In cases of admitted defeat and failure we display in our cheeks the white flag of surrender. The blush of sex-consciousness, upon which Mrs. Gilman lays such stress, does not differ essentially from the blush of modesty in general. It arises from the feeling that one's thoughts of a lover, however natural and proper in themselves, would if expressed fall under the taboo of society.

The blush acts as a regulator only of manners and the minor morals. A man does not blush when he commits a murder or when he is detected at it, but rather when he finds his derby has a dent in it. The flush of angry or amorous passion is so different in meaning and appearance from the blush of modesty that it is not necessary to say that here we are only considering the latter. The blush of pride is probably a sort of an apology to others lest one should be disapproved for his conspicuousness and the undue share of attention he is receiving.

Since modest and modish are so closely related, it is no wonder that women indulge in all the extravagances of fashion without suffering any of the pangs of offended modesty. A peacock who could not spread a tail of brilliant plumage would feel very properly ashamed of himself, and his modesty would keep him away from the society of other peacocks, and especially of the peahens. Among savage races and the lower animals, whom Mrs. Gilman is inclined to hold up to us as models, it is the male who is most decorated and adorned by art or nature. We see no reason, however, to suspect that the instinct of civilization is wrong in the lavish adornment of women. Woman is the consummate flower of evolution; the pride of the human race, including herself. It is proper that the arts should thus pay tribute to their patroness and inspiration. As the sap of the roots becomes the bloom of the flower, so the useful becomes the beautiful when touched by the hand of woman. The masculine utensil becomes a feminine ornament.

She takes the shaving-brush for which she has no use and makes of it a cockade for her hat. She takes the watch from the pocket and pins it on her breast. Suspenders are to her but a form of dress trimming. Since male animals have for several million years monopolized extravagance and display in dress, it seems only fair that with civilized man the privilege should be reversed and woman be allowed for an equal period to deck herself with the more brilliant plumage. At least we shall not object to it until we see some way of stopping it.

### Progress in Dishonesty

IT is but natural that such disclosures of dishonesty in the business world as those which have followed in close succession since the collapse of the shipbuilding combination should create an atmosphere of moral pessimism. Still, it is well to remember that the lament, "We have fallen upon evil days," long since lost the quality of novelty.

Wealth bulks bigger to-day than it did a century or two ago, and stealings that would have seemed attractive to the rascals of Washington's and Jefferson's day are hardly worth bothering about at present. In order to grow a crop of really luxuriant rascals in these days the dung must be squandered. It is a truism of Sociology that a community always has as many criminals and paupers as it wishes and can afford to pay for. An impoverished society can indulge in but few villains or only in little ones. The American nation is rich, and New York City is very rich. We have outgrown the small economies of Poor Richard's day. We are now able to maintain thieves as big in their way as our millionaires and their flunkies. In fact it has ceased to be good form to commit those petty thefts that are punished by hard labor in the State's prison. So far as social position and moral influence go a man might about as well be honest and respectable as make a small fortune by forgery or embezzlement.

These facts should be remembered

when we try to estimate the comparative dishonesty of the present and former generations. Duly weighed they must render us cautious about inferring that we have made great progress in wrong doing. In a finite world all things are relative, and a thief who steals a million dollars from millionaires is not necessarily more wicked than a thief who steals a hundred dollars from frugal and hard working farmers or from small tradesmen. John Law's enterprise was a petty affair, of course, by comparison with the Philadelphia plan to filter the Schuylkill, or the scheme to rig Amalgamated Copper; and the wrecking of the Charter Oak Life Insurance Company a generation ago was a petty exploit if measured by Equitable achievements. Nevertheless, we think that the thesis might be defended that modern finance is only bigger and more rapid than ancient finance, just as other things are bigger and more rapid than corresponding things in primitive days, and that it is really not more diabolical.

It is true that there have been years together at various times since recorded history began when a majority of business men were addicted to honesty. Biographical writings, and even serious historical works, contain so many allusions to business integrity and to such practices as the faithful management of financial trusts that we cannot doubt that such things have actually existed. There is every reason to believe that now and then honesty has been maintained without imperiling "prosperity"; indeed, that upright business men have prospered to a reasonable extent. It would be interesting, and we think worth while, if some clever young doctor of philosophy should investigate this obscure but undoubtedly actual phase of economic and moral history. It could do no harm to ascertain what peculiar and complicated social conditions have now and then brought about a fairly general prevalence of business honesty and how without the motive power of "graft" the mechanism of the business world has been kept going. It is possible that such a state of affairs may

at some future time prevail again; and it would be well if the mind of the business community could be forewarned by a knowledge of the past of any general reaction toward honesty in business method.

It has been suggested that an enforcement of the criminal law has now and then operated to check the free and spontaneous activity of the stealing instinct. A leading New York newspaper went so far the other day as to insinuate that while preaching and all known forms of religious exhortation are wholly ineffective to increase the total manifestation of honesty in the business world a great multiplication of the annual consignments to Sing Sing might produce measurable results. The expediency of such an experiment, however, is more than doubtful. Modern business is a complicated as well as a very big affair. Economists and others whose occupation it is to demonstrate that without the creative mind of the great *entrepreneur* laborers could not produce wealth have shown to the satisfaction of many intelligent minds that we owe all our wealth to business ability. It is not difficult to predict, therefore, what would happen to us if all our business ability should be "sent up" to "do time."

It would seem, therefore, that some other explanation should be sought of the occasional appearance of prevailing honesty in the business world than that which attributes it to an enforcement of the criminal law. We are not prepared to offer a better explanation. It is a curious phenomenon from whatever viewpoint contemplated. We can only insist upon the historical certainty that honesty really has prevailed here and there, now and then, without bringing industrial operations to a standstill and urge that a further investigation of all the causes and conditions entering into so curious a state of things is a legitimate subject for scientific research.

But whether or not we ever know more about it than we know now, we are justified by the facts already in our possession in cautioning our business friends against undue dread of a

sudden return to an age of honesty or any unfounded belief that we are making more rapid strides in dishonesty than our plodding ancestors were capable of making. In this as in all matters of human concern it is safe to avoid extreme views. There is probably still enough first rate business ability of a totally unscrupulous quality to keep the wheels of industry turning, and there is not the slightest reason to fear that the public will consent to try the cranky moral experiment of placing it behind prison bars. On the other hand, it would be too much to hope that in the lifetime of men now in their business prime dishonesty will increase fast enough to make all men satisfactorily rich.

### Drowning Accidents

WE are just entering upon the season when reports of drowning accidents become painfully familiar in the daily newspapers. Scarcely a day passes during the summer season when some one is not drowned as the result of almost criminal carelessness. Some mornings the drowning accidents of the day before will number half a dozen or more. If it has been a holiday or a Saturday afternoon then especially are the fatalities frequent. Many hundreds of people lose their lives every year, usually in the midst of their vacations and under circumstances that make their deaths extremely sad for their families. Unfortunately, too, most of the lives that are thus sacrificed are those of young, healthy adults who have the promise of long years of life ahead of them but for the untimely accidents of which they are the victims. And yet these accidents are nearly all easily preventable, and the consequences of some of them can be rendered much less serious by the prompt assistance of those who are near at hand, if they only realize what it is necessary to do.

Of course in these mishaps an ounce of prevention is worth a pound of cure. Many of the saddest drowning accidents take place from small pleasure boats. If the injunction of the United States Volunteer Life Saving Corps were followed

never to go out in such a boat without seeing that there are sufficient life saving buoys or cushions aboard to float all of the party in case of an upset or collision, or unless the boat is festooned with life saving ropes, it would save most of the lives that are now lost in this way. The other injunctions never to stand up in a small boat and never to change places, especially if there are women in the boat, have been repeated so many times that it would seem as tho every one must know them by heart, and yet it is just the neglect of this precaution that causes many a fatal accident in summer. As for the fools who rock a boat for fun, all that may be added is that there is said to be a fool born every minute, and these, like the "didn't-know-it-was-loaded" variety, are such glaring examples that one can scarcely be sorry for them if they cause only their own deaths and not that of any of those of the party with them.

The other most important series of fatal accidents from drowning takes place among bathers. It seems almost needless to keep repeating each summer that swimmers who are very nervous, and especially such as are liable to cramps of any kind, should not venture beyond their depth unless under circumstances in which they are assured of immediate help in case there should be a tendency to collapse or the occurrence of a crampy seizure. Not a few of those who are drowned each year have had warnings in this matter from their own personal experience on previous occasions, and must be considered as taking their lives in their hands, especially when, in spite of the disabilities under which they labor, they attempt to make their way to a raft or distant buoy against buffeting waves on blustery days. Alas for human nature, however, it is just the people of nervous constitution whose physical condition predisposes them to such attacks that are likely also to have the hardihood to undertake such imprudent feats.

There is another class of persons who are in serious danger but to whom warnings are not so frequently given. These are such as occasionally suffer from attacks of giddiness on land or who have had serious difficulty with their hearing as the result of middle ear disease. In such cases there is often a pathological

condition of the internal ear which predisposes to an accident that may cause total loss of the sense of equilibrium. It is usually said when good swimmers drown without having made much struggle, and sometimes without much outcry, that they have been seized by cramps so violent as completely to unnerve them. It is much more likely that in most of these cases there has been an apoplexy in the semicircular canals. These semicircular canals constitute the organ of direction in man. By means of them, even with eyes bandaged or in the dark, he is able to direct himself to a considerable extent and is able to tell about the position that he occupies in a room. The presence of a previous ear disease predisposes these delicate organs to the occurrence of rupture of one of the small arteries within them. Should this take place there is at once a complete loss of the sense of direction and an intense subjective sensation of vertigo that destroys all feeling of equilibrium. It is easy to understand that if this should occur when a swimmer is considerably beyond his depth there would be little hope of his finding his way to land. Swimming is after all mainly a balancing feat in the water, and the balancing sense would thus be destroyed. Hence the importance of guarding the ears from injury by waves and the extreme advisability of those who have ever suffered from any vertigo or from middle ear disease not taking chances in rough water beyond their depth.

With regard to all drowning accidents it must be remembered that the mere fact that a person does not breathe and has no pulse or even no signs of heart beat is not a definite indication of death. Persons have been resuscitated from apparent death from drowning as long as two hours and a half after their disappearance from the surface of the water. Usually the cases in which there has been least struggle are the most hopeful. Many nervous persons seem really to faint away rather than actually drown, and as a consequence of this are in a state of collapse rather than of active suffocation from submersion. No efforts should be spared, then, to bring the apparently drowned to life. Any of the ordinary methods of practicing artificial

breathing are efficient. It is important not to delay by rolling the patient on a barrel with the idea of getting the water out of him, since as a rule there is very little water swallowed. A single turning on the face, raising the lower part of the trunk, will dispose of this. The tongue must always be firmly gripped and pulled well out. Rhythmic traction on the tongue is indeed a great help to any method of artificial respiration. It is always a mistake to give persons who are apparently drowned any stimulants before they have shown distinct signs of life. Even then stimulants should be given only in small quantities. If there are several persons present who wish to help in the process of resuscitation it is well to employ some of them in slapping the feet and vigorously rubbing the extremities, not away from but toward the trunk. This will prevent them from gathering around the patient's head and preventing free access of air. The main element for successful resuscitation, however, is patience and, again, patience. After all hope has been given up by those inexperienced in such matters the expert rescuer will continue his efforts and succeed in bringing the patient back to life.

### Socialism and Patriotism

AN interesting discussion has been going on in France in regard to whether socialism is antagonistic to patriotism. "Proletarians have no country," said Karl Marx in 1847. The Socialists, by their advocacy of international disarmament, by their indifference to the recovery of Alsace-Lorraine, by their opposition to colonial aggression and by their talk of universal brotherhood, have been brought under suspicion of not being good citizens. A public school teacher, M. Gustave Hervé, set the question on fire by teaching his pupils "internationalism" instead of the prescribed lessons in patriotism. He declared that the flag should be cast upon the rubbish heap, that the only legitimate war is civil war and that he would as soon be a German as a Frenchman, altho he admitted that he would draw the line at being a Turk or a Russian. He advocated the plan of

Tolstoy for doing away with war, that every man should act according to his own conscience and refuse to fight a man against whom he has no personal grudge; a doctrine which was preached in this country by Lowell when he fought the Mexican War:

"Ef you take a sword an' dror it,  
An' go stick a feller thru,  
Guv'ment aint to answer for it,  
God'll send the bill to you."

The Nationalists have made so much of the sensational utterances of M. Hervé that the eloquent Socialist leader, M. Jaurès, was impelled to relieve his party of the accusation of being traitors to their country by meeting him in a public debate. M. Hervé recommended a strike of the soldiers, not now, because workmen do not strike in the dead season, but on the eve of a declaration of war. Each man should refuse to obey the call to arms, and if a gun is put into his hand he should use it on the man who gave it to him.

M. Jaurès, in reply, showed that such a military strike would be injurious to the cause of the people, whether it should result in the defeat of the country or not. When socialism shall be realized there will be no antagonisms between classes and peoples, but nations will remain as distinct groups, having their own national physiognomy, language, customs, traditions and genius, like branch workshops in the great workshop of the world. There will be a communistic humanity organized in a world federation. All men will become brothers, but not alike. He did not want a level planet.

"Humanity has need of the free German spirit as it has of the free French spirit, and German Socialists would commit a crime of *lèse-humanité* if they allowed the French to invade Germany, and the French would commit the same crime if they allowed the Germans to invade France. You say, Citizen Hervé, that we are French and that we could become Germans only by conquest. In that case we would not be true Germans, but the slaves of Germans. It seems extraordinary to me that you should offer to the French proletariat, as the first step toward liberty, the acceptance of one despotism the more."

This, taken in consideration with the former declaration of Herr Bebel that

German Socialists would if necessary take up arms in defense of their fatherland, indicates that the Socialists on both sides the Rhine preserve enough of the old fashioned nationalistic spirit to insure resistance against any violent invasion of their national rights. More than this no people needs. We are confident that the interests of France are safer in the hands of an "Internationalist" like Jaurès than in those of a "Nationalist" like Déroulède, now banished to Spain for military conspiracy. French chauvinism when properly diluted will make good patriotism.

#### The Chinese Boycott

So the Chinese amount to something after all. They can boycott the United States and stop our exports to China and close an open door, and they can do all this with not a bit of legal or diplomatic action that we can complain of. All that is necessary—and it is apparently easy—is for the individual people to say that they will not buy any American goods. They will buy of Japan or England or Germany, or even of Russia, but not a case of oil or a yard of calico from the United States. And while all moral considerations were of no effect to repeal a wretched law or to abate the scandal of its stupid enforcement, just as soon as the merchants' profits are touched business protests, and a long Cabinet meeting is held, and orders are given to our consular authorities in China to show more care in issuing certificates to Chinese coming to this country, and the officers of the Department of Commerce and Labor are directed to exercise more courtesy and sense in their enforcement of the laws, which laws are intrinsically bad and ought to be administered in a way to make them as nearly innocuous as possible. We are glad that at last our people are finding that our Chinese policy is unprofitable as well as contemptible.

#### Education in China

The report of the committee, composed of Chang Chi Tung and the two chancellors of the University of Pekin, and appointed by the Chinese Government June 29th, 1903, to devise a system of education for the Empire, has com-

pleted its report, which is published in five volumes. Education will begin at the age of seven and continue twenty-six years, apportioned as follows: Nine years in elementary schools, five years in the intermediate grades, three years in the high school, four in the university and five in the technical college. The study of foreign languages will begin at the age of sixteen. The English and Japanese languages are required, and French, Russian and German are optional. Elementary instruction is free and not obligatory. The instruction is based upon Confucianism and fidelity to the Emperor and the dynasty is to be taught in all the schools. The committee considers it inadvisable at present to open schools for girls and the fear is expressed that if the young women are too highly instructed they will wish to choose their own husbands, and that they will cease to be dutiful and obedient. This is fair progress for China, even more than could have been expected. Here is further evidence that English is the world's language.

#### Southern Methodism

We find the following credited to the chief organ of the Southern Methodist Church, published in Nashville:

"It is singular that neither Bishop nor President can see that if by 'civil privileges' is meant the holding of public office, then the distinction cannot be maintained. Here precisely is the crux of the problem. Southern people do not especially object to the negro's voting, provided he has qualified himself for it. But so long as he is outlawed socially—as he will be always—just so long is he ineligible for office, outside the limited number of offices which would bring him into contact with his own people only. Is this unreasonable? So is race antipathy. Is race repulsion deep-seated, ineradicable? So is the objection to negro office bearers. The sooner the President comes to understand this, the better for his peace of mind and for his relations with the people of the South."

But race antipathy is not ineradicable, as is abundantly proved the world over. It is a cultivated vice. And it is cultivated by precisely such methods as those of the Daughters of the Confederacy at Fort Worth, Texas, who voted to give a framed copy of the Declaration of Inde-

pendence to the public schools, but then excluded the colored schools from the gift. But it is condemned by those white men in Columbia, S. C., who the other day volunteered in court to defend and protect two negroes charged with crimes and on whose testimony twelve white jurors declared them innocent of a capital offense. The quotation given above is not what we would have expected from the organ of the Church which more than any other is developing better relations between the races in the South.

It was at the last chapel service attended by the Senior class at Amherst College, June 10th, that Professor Grosvenor made them an address from which we cull these words:

"From the ranks of college men are recruited the chronic fault-finders, the censorious doctrinaires, the disbelievers in the integrity of Church and State, of clergyman and statesman. In their opinion almost everything done is wrong. If by chance anything done be right, in their opinion it is done in the wrong way. God keep every man of you from sympathy with pessimists, above all from fellowship in their acrimonious company!"

That is healthy talk. These doctrinaires are cultivated in the atmosphere of criticism, not of achievement. It is true that they are college men, but jaundiced by the failures of their college ambitions everything looks evil to their perverted vision.

The extent of the application of the French law closing the schools conducted by the religious congregations is greater than some have imagined. *Le Temps* adds them up, and finds that 2,025 schools have been totally closed, and 539 partially closed, a total of 2,564. We do not do that in this country. At least there is left in France the sort of Sunday school which the Pope in his last encyclical directs the priests to provide. They must "on every Sunday and feast day throughout the year, without exception, for the space of an hour, instruct the young of both sexes

from the Catechism in what every one must believe and do to be saved."

Two thousand are reported killed and wounded in fighting in the streets of the city of Lodz in Russian Poland. That comes close to civil war, for there were barricades in the streets, and the Jews dared to use arms, and Warsaw is not far off, and there a new strike is ordered. In 1831 the fall of that city was announced in the Paris Chamber of Deputies in these words: "Some letters which I have received from Poland inform me that order reigns in Warsaw." Such "order" does not last. Already we have news of barricades in Warsaw and the Hebrew districts in revolt. But we hear as yet of no leader, and a revolution needs a leader.

The Catholic University at Washington is not so very badly off, notwithstanding its losses by the financiering of Mr. Waggaman. Its assets are reported at \$1,225,000, of which \$83,000 are the fruit of an effort by Cardinal Gibbons to raise \$100,000. The wealthy Catholic Church ought to find it as easy to raise \$1,000,000 as \$100,000.

Mrs. Lucinda Ganson, of Davenport, Iowa, was lately left \$30,000 on condition that she change her faith and become a Roman Catholic. She refuses, and says: "I cannot think of changing my religion for any amount of money." Catholics no less than Protestants will respect her for her honor. And yet European princesses have freely changed their religion to marry a throne.

In a college address last week Mayor McClellan said:

"The man who betrays his public trust for money makes, by comparison, the crime of Benedict Arnold sink into insignificance and lends a respectable hue even to piracy."

An admirable statement. The crime is worse than—indiscretion. Even the appearance of it deserves serious censure.

# Insurance

## The Equitable Life

THE report of Superintendent Hendricks upon the Equitable Life scandal not only confirms the charges of the Frick report, but goes far beyond them. Attorney-General Mayer announces his purpose to proceed promptly in the courts for a restoration of the syndicate profits and for the exclusion from office of those directors and officers who have exposed themselves to such punishment. District-Attorney Jerome is examining the record to ascertain whether it calls for the prosecution of any one on a criminal charge, and at his request two of the courts in New York will remain open during the summer for the consideration of such questions as he may bring before them. The activity of these law officers points to the punishment of persons who are to some extent responsible for what has taken place; it is not concerned with measures of thorough reform for the future. As to what ought to be done, Superintendent Hendricks says:

"No superficial measures will correct the existing evils in this Society. A cancer cannot be cured by treating the symptoms. Complete mutualization, with the elimination of the stock, to be paid for at a price only commensurate with its dividends, is, in my opinion, the only sure measure of relief."

In another part of the report he expresses the opinion that the recent change of control, with the accompanying appointment of trustees, will not go far toward restoring the confidence of policy-holders or aid in procuring new business, adding that confidence can be restored only by the elimination of stock control, "and what I deem of equal importance, the elimination of Wall Street control." It is important, he also says, that the Legislature should consider the question of establishing a standard (as in the case of savings banks) for the investment of life insurance funds, and that the investment of such funds in subsidiary moneyed and business corporations should be prohibited.

It will be observed that legislative action is required for the realization of these reforms—complete mutualization, elimination of Wall Street control and the restriction of investments. It hap-

pens that the Legislature is in extraordinary session for another purpose. This insurance matter cannot be considered unless it comes before the Legislature with the Governor's recommendation. Unquestionably, it seems to us, it is Governor Higgins's duty to lay the whole subject before the legislators at once, in order that a part of the needed legislation may be obtained without delay and that provision may be made for an investigation which will point the way to such additional laws as are required.

## Steel Cars for the Railway Mail Service

IT would seem that something ought to be done for the better protection of the men engaged in the railway mail service. Appalling lists of deaths and injuries due to railway wrecks in which the mail cars were only too frequently either demolished, burned or badly damaged might easily be made out from published accounts that appear in the daily press. THE INDEPENDENT recently called attention to the increasing number of railway accidents, both in this country and in Europe, and in all railway accidents the mail cars usually figure. In view of all this it is gratifying to note that a step has been taken in the direction of providing more security for those who are concerned with what has been called the railway mail. A fifty-ton all-steel car for the railway mail service has just been built and was exhibited last month in the yards of the Erie Railroad Company in Jersey City.

Features in the new car were heavy steel work at the ends and a strong steel canopy overhead, together with a heavy steel underbody. In view of the experience of the Interborough Company with steel framed cars in its passenger service, it is certain that the use of steel in mail car construction, which is bound to come, will tend to minimize if not to eliminate the demolition of mail cars in cases of accident. The danger to the life and limb of railway mail clerks will also be greatly reduced when the use of all-steel cars becomes general. Accident insurance companies will welcome the reduction of accident hazard in this direction.

## Trade with China Menaced

It is beginning to be understood at Washington that the Chinese merchants who have set out to boycott American goods are in earnest and that an important and growing part of our export trade is in great danger. The movement began at Shanghai about two months ago. It has spread through 17 of China's great provinces. The members of an association representing the commercial guilds of those provinces have agreed that a fine of 50,000 taels shall be imposed upon any one of their number who shall after a certain date (said to be August 1st) purchase American goods. Chinese merchants exercise a powerful influence upon trade in many parts of the Orient outside of China. Those in Singapore are assisting the movement, and others in the East Indies will follow their example. A convention of students at Tien-Tsin, on the 19th, representing many educational institutions, adopted resolutions favoring the proposed boycott and undertook to circulate Anti-American publications. A warning cablegram to the President from a prominent merchant in Hong Kong who is the leading importer of American flour was considered at a Cabinet meeting on the 23d, when the gravity of the situation was realized by all who were present, Secretary Metcalf excepted. The immigration inspectors whose harsh treatment of Chinese students and travelers has suggested this retaliation are employees of Mr. Metcalf's Department, and his home is in California, where opposition to Chinese immigration of all kinds has much force in politics.

Mr. Metcalf asserts that the Chinese exclusion law, as it affects immigrants of the exempt classes, has not been harshly administered. But there is evidence to the contrary, and this evidence appeals with much force to Mr. Metcalf's colleagues in the Cabinet and to the President himself, who has now given instructions that Chinese entitled to enter the country must be treated with due consideration. The Chinese Government is to be informed that such instructions have been given. Unfortunately,

the question cannot be laid before Congress until December, and the boycott may be in full operation several months earlier. The cause of complaint is not the exclusion of Chinese laborers. "What cuts the pride of the Chinese people to the quick," says the Chinese Vice-Consul at New York, "is the outrageous treatment of their countrymen who are exempt and who come to America to spend money in acquiring a knowledge of American civilization and affairs and who, if treated decently, would go back and help American trade by spreading their favorable opinions." There are other reasons, besides those relating to trade, which call for a modification of the law, but the loss of the greater part of our exports to China (which include about \$27,000,000 in cotton goods) should be avoided.

### DIVIDENDS announced:

American Woolen Co. (preferred), quarterly, 1½ per cent., payable July 15th.  
Westinghouse Elec. & Mfg. Co. (preferred), quarterly, 2½ per cent., payable July 10th.  
Bowling Green Trust Co., 3 per cent., payable July 15th.  
American Chiclé Co. (preferred), quarterly, 1½ per cent., payable July 20.  
American Chiclé Co. (common), 1 per cent., payable July 20th.  
Amer. Teleph. & Tel. Co., \$1.50 per share and extra 75 cents per share, payable July 15th.  
Amer. Teleph. & Tel. Co., collateral trust coupons, 4 per cent., payable July 1st.  
Amer. Locomotive Co. (preferred), 1¾ per cent., payable July 21st.  
Buffalo & Susq. R. R. (common), quarterly, 1¼ per cent., payable July 1st.  
Buffalo & Sus., R. R., 1st mort. coupon, payable July 1st.  
Gulf & Ship Is. R. R., 1st mort. coupons, payable July 1st.  
Century Realty Co., 4 per cent., payable July 1st.  
U. S. Mort. & Trust Co., 8 per cent. and extra 2 per cent., payable June 30th.  
Electric Storage Battery Co. (preferred and common), 1¼ per cent. each, payable July 1st.  
Southern Pac. Co. (preferred), 3½ per cent., payable July 17th.  
U. S. Leather Co. (preferred), 1½ per cent., payable July 1.

# "Standard"

PORCELAIN ENAMELED  
Baths & One Piece Lavatories

"Standard" Ware is the only equipment for modern bathrooms which meets every requisite of absolute sanitation, beauty of design, quality and low cost. Its installation guarantees health to the home, luxury and comfort to the bathroom, and an added value to the property.

Our book "MODERN BATHROOMS" helps solve the bathroom question, and you need it. It shows many complete model interiors of great beauty and economy from \$70.00 to \$550.00, with cost of each fixture in detail. It tells about decoration, tiling, stained glass, modern laundry and kitchen equipment, etc., etc. It will save you money. Free for six cents postage.

**CAUTION:** Every piece of "Standard" Ware bears our guarantee "Green and Gold" label, and has our trade-mark "Standard" cast on the outside. Unless the label and trade-mark are on the fixture it is not "Standard" Ware. Refuse substitutes—they are all inferior and will cost you more in the end.

Insurance, Financial, Etc.

Is  
**ANYBODY**  
Interested  
in  
**EVERYBODY'S**  
for  
**JANUARY?**

If so, he should desire to know the truth about that title page and that spurious life insurance policy, and a great deal of historical information concerning the fiction in

**“Frenzied Finance”**

You can get the facts only as a reader of the Boston News Bureau, which from the beginning exposed Amalgamated Copper, its birth in Bay State Gas, and forecasted all the disasters which have befallen the company and its shareholders. At the same time it met and clearly showed the fallacy of all Lawson publications promoting Gas and Amalgamated.

**The Libel Laws**

in Massachusetts are such that the truth of a statement goes farther in justification of its publication than in any other state.

The libel laws of New York and Pennsylvania are so drawn as to endanger the property, liberty and personal freedom of editors and publishers.

The Boston News Bureau publishes financial matter every week, and has for many years, that no other publication in the United States dare print.

In 18 years its steady progress has never been halted but once, and that was for the period during which the Standard Oil-Amalgamated-Lawson party claimed that personal animus or other unworthy motives were inspiring the Boston News Bureau in its exposures of Bay State Gas and Amalgamated Copper.

The decline in copper from the artificial 17 cent copper market, the collapse in Amalgamated dividends, the failure of Amalgamated to control the politics and courts of Montana as clearly forecasted in the Boston News Bureau, opened the eyes of the public to that false claim that a newspaper could not know or could not tell as a pure news business enterprise the truth about such large matters; and the circulation of the Boston News Bureau is now growing as never before.

**The Claim for the  
BOSTON NEWS BUREAU**

is that it is the most complete and the nearest ideal daily financial publication in the United States for the men of affairs and investments—for those who should study and know the leading facts and factors controlling in business and finance.

It is written and printed for investment interests only—is published for no other object—has demonstrated through its 18 years of progress its right to stand at the head of true financial journalism.

Its sales of late have been larger than those of any other financial publication in America. Its present business aim is to increase and maintain the lead and hold a permanent subscription list of intelligent investors exceeding that of any other financial publication.

It is published after the close of the market every day in Boston and goes promptly into the mail for distribution over the country.

While it can be bought generally upon leading news stands, it cannot be so purchased regularly, for every time there is excitement or great interest in financial affairs, or any special presentations, the issue to the news stands is quickly bought up and sometimes commands 25 cents per copy premium.

The safe way for a man of business affairs, is to subscribe for this paper for one month, read it thoroughly, become a believer or disbeliever in the principles, aims and motives actuating its management, and then, if found useful, become a regular subscriber at \$12 per annum.

**C. W. BARRON, PUBLISHER,**  
**Exchange Place, Boston.**

P. S.—A pamphlet printed many months ago and containing excerpts from Boston News Bureau articles on Amalgamated, published over a series of years from the inception of the company, will be sent free upon request.
